Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every brauch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

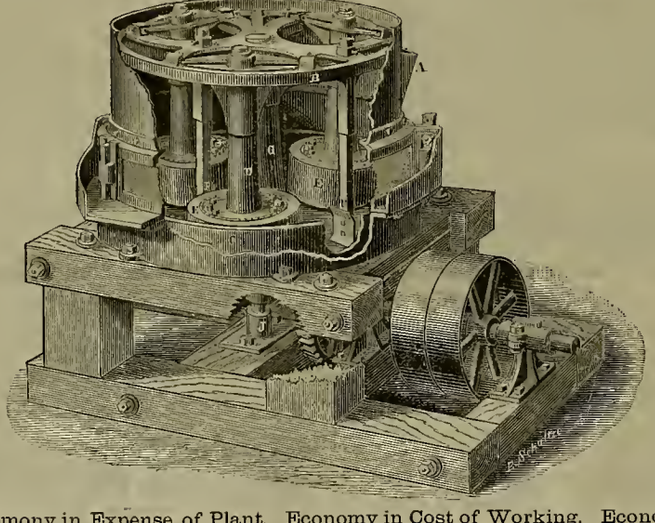
F. A. HUNTINGTON'S
CENTRIFUGAL ROLLER QUARTZ MILL.



Ecomony in Expense of Plant. Economy in Cost of Working. Economy in Saving Gold. Economy in Transportation of Machinery. Economy in Cost of Erection of Mill at Mine. Economy in Time Required to Establish Plant (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of continuous use at a number of mines in California has enabled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached THE ABSOLUTE in the construction of a perfect Quartz Mill.

Mining Legislation.

The bill to pay the claims for building the debris impounding dams on the Yuha and Bear rivers has passed the Assembly, and now goes to the Senate.

The Cross bill, concerning mining dams, which we gave in full last week, has been favorably recommended by the committee.

A bill has been introduced by M. S. Torrey to compel individuals, companies or corporations owning or controlling water for the purpose of mining or irrigation, to distribute the water pro rata among the purchasers in times of scarcity or drought. The provisions are as follows:

SECTION 1. Any corporation, company or individual owning, controlling or holding the possession of the water flowing in any ditch, canal, pipe or flume, who rents, sells or distributes the water therein for purposes of mining or irrigation, in times of scarcity or drought, or when there is not a sufficiency of water in such ditch, canal, pipe or flume to mete out to such purchaser the full amount of water purchased by him, shall distribute, or cause to be distributed to each purchaser his due pro rata of the water flowing in such ditch, pipe, canal or flume; *provided*, such purchaser shall satisfy such individual, company or corporation owning, controlling or possessing water, as in this Act mentioned and specified, for the payment of the water that may be distributed to any such purchaser.

SEC. 2. Any person injured on account of a non-compliance with any of the provisions or requirements of this Act shall recover by process of law from such possessor, individual, company or corporation such amount of money, as damage, sufficient and necessary to cover all loss, damage or injury sustained by him.

SEC. 3. This Act shall take and he in full force and effect from and after its passage.

Mining Share Market.

About all the business being done in the stock market is confined to the middle Comstock mines, and there is not very much in them. Should the crosscuts soon to be run on the 2900 level show an abundance of pay ore, the effect on the market can easily be conjectured. Both Chollar and Hale and Norcross stocks are strongly held at this interesting junction. While all the other Comstocks are as dull and depressed as they can well be, the *Enterprise* thinks that there will surely be a revival and some rapid advances in them if the new level of Hale and Norcross turns out successfully. From this time forward the middle stocks will be more interesting to operators and dealers, and lively fluctuations are expected in them while the work of exploring the new levels progresses.

At Gold Hill they are running things in the usual manner and taking out considerable low-grade ore from the Crown Point and from the upper levels of the Yellow Jacket. The Belcher is also doing the usual amount of work and sending a large amount of low-grade ores to the mills.

Bullion Shipments.

Alhambra Mill, February 15, $13,198; Barber's Mill, 15, $3,276; Moulton, 3, $20,416; Old Lexington, 5, $1,456; Alice, 4, $25,132; Lexington, 6, $23,600; Alice, 6, $12,928; Vienna, 10, $3,900; Minnie Moore, 10, $4,380; Germania, 11, $22,139; Wood River ore, 10, $973; Nevada ore, 12, $3,200; Vienna, 12, $1,860; Ontario, 12, $24,162; Crescent, 13, $4,400; Germania, 13, $10,880; Christy, 13, $1,500; Minnie Moore, 13, $1,070; Vienna, 14, $1,990; Stormont, 15, $3,352.

The banks of Salt Lake report the receipt for the week ending February 11th, inclusive, of $75,799.55 in bullion and $12,143.92 in ore. There were shipped from Salt Lake during the week ending February 14th, 21 carloads of ore, 611,286 pounds; 19 cars bullion, 433,629 pounds; making a total of 41 cars, aggregating 1,044 915 pounds.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco:

GOVERNOR MORTONS M. Co., Feb. 17,—Capital stock $1,000,000. Directors—L. A. Booth, W. H. Brown, H. F. Cooper, W. Carson and B. J. Watson.

HUNT AUTOMATIC LOOM CO., Feb. 14—Capital stock $1,000,000. Directors—R. H. Hunt, G. Wihl, George Stevens, F. A. Will and J. B Reinstein.

FOR ARIZONA AND N. M.—Mr. Frank W. Smith will shortly travel as our representative for the MINING AND SCIENTIFIC PRESS, through Arizona and New Mexico, stopping on the way at Calico and other southern California mining districts. Mr. Smith will forward for the PRESS descriptions of the country he is to visit and will pay more particular attention to the mining interests, describing the mines, mills, smelters, etc., in the regions in question. We bespeak for Mr. Smith a cordial reception, and hope that those whom he meets will give him such reliable information as is in their possession. His letters will be of interest, as he is familiar with mining matters and will gather such items of information as will be useful to our readers and will be of benefit to the mining industry.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

THE BLIND.—The Assembly hill to appropriate $80,000 to establish a home for the adult blind, where they can be usefully employed, has also passed the Senate, amended, however, to make the appropriation $40,000. This amount will do for a starter, but will not admit of venturing upon the erection of a large building. Still, it is a beginning, as the people will see the advantage of the institution. No doubt it will receive donations from individuals and the State.

THE new mill at Kinkead, on the line of the Carson and Colorado Railroad, is running on ore from the Moss mine. A bar of gold bullion valued at $4,000 was shipped from there last week, the result of the first clean-up.

Market Reports.

Lumber at Wholesale.

There is a fair demand for lumber, but no special changes in price. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No. 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $39; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 refuse) do do do, $21.

CLEAR - No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and 1x0, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.20; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for pine, fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱ M ft, $33.50; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $29.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do do, No. 1, $37.50; do do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.50; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1-¼inch, ₱ M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

Retail quotations of Redwood are as follows:

ROUGH MERCHANTABLE—₱ M ft, $22.50; do Selected, $27.50; do No. 2, $18.50; Surface, No. 1 and Rough Clear, $40; do, 1x6, $37.50; do, No. 2, $30; Rustic, No. 1, 1x8, $37.50; do, No. 1, 1x10, $40; do, No. 2, $35; do, under 10ft, $35; T and G Redwood, 1x4, 1¼x4 and 1¼x6, $40; do do, 6-inch, 12 ft and over, $37.50; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; do do do, No. 2 $30; do do, Beaded, 12 ft and over, $40; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; Half inch Surface, $52.50; Pickets, Fancy, $30; do, Rough, pointed, $20; do do, square, $17.50; Siding, ½-inch, $27.50; Battens, ¾-inch, per lineal ft, 1c; Shingles, ₱ M, $2.50; Shakes, Split, $15; do, Sawed, $12; Posts, per piece, 13c; Dressed Boards, ₱ M ft, $25.

On a credit of 60 days or less, or a discount of two (2) per cent for cash only. On all credits exceeding 60 days' time, not less than one (1) per cent per month to be added.

Under the rules of the Exchange, no "lump" sum will be given on any bill of lumber.

Nails.

We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.90: 8d and 9d, $3.0; 6d and 7d, $3.25 4d and 5d, $3.50; 3d, $4.25; 2d, $5.50.

BARRELS.—¾ inch, $6.75; ⅞ inch, $5.75; 1 inch, $5.25; 1¼ inch, $4.50; 1½ inch, $4.25; 1⅝ inch, $3.75; 1¾ inch, $3.50.

LINING.—⅞ inch, $7.25; ¾ inch, $8.75.

TOBACCO.—10d, $3.25 8d, $3.50; 6d to 7d, $3.75.

CINCH.—6d to 30d, $4.50.

SLATING.—5d, $3.75; 4d, $3.75; 3d, $4.50; 2d, $5.75.

FINISHING.—2d, 1 inch, $3.75; 3d, 1¼ inch, $6.75; 4d, 1½ to 1⅝ inch, $4.50; 6d, 2 inch, $4.25; 8d, 2½ inch, $4.00; 10d, 2 inch and over, $3.75.

CASING AND BOX.—10d to 30d, $3.50; 8d, $3.75; 6d, $3.00; 4d, $4.25; 3d, $5.25.

FINE BLUED.—4d, $4.50; 3d, $5.75; 2d, $6.50.

CUT SPIKES.—All sizes, $3.00.

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Material.

Lime, per barrel, $1.50@$1.60. Plaster, $2.75–3.00. Eastern Plaster, $3.00–3.25. Rosendale Cement, $2.25–2.75. Portland Cement, $3.50–3.75. Fire Brick, per 1,000, $40 @ $45, according to brand; hard, $10.00@$12,00; red, $8.00@$8.50; soft, $7.50; face, $30.00.

THE IRON-WORKERS' STRIKE.—The strike among the men in the large foundries and machine shops in this city, which has been in progress the last two weeks, came to an end on Thursday. On that day it was decided by the employers to take the men back at the old rate of wages, and on Friday most of them returned to the shops. It is probable, however, in view of the business depression in this branch of trade, that work will be continued for a time with reduced force. It is hoped that when spring opens there will be a revival of work, so that the foundries can again run full-handed on full time.

THE Hocking Valley strikers have been starved into accepting their employer's proposition and are going to work.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING FEBRUARY 10, 1885.

311,949.—STEPLADDER—Chas. Brand, Oakland, Cal.

312,084.—MACHINE FOR SCREW THREADING WIRE—A. Cavalli, S. F.

311,972.—AUTOMATIC LAMP—T. A. Fitzsimons, S. F.

311,980.—PLOWSHARE ATTACHMENT—Samuel Hamilton, Salinas, Cal.

311,990.—COFFEE POT—E. H. Judkins, S. F.

312,225.—STAMPING MARGINS FOR CEMENT PAVEMENTS—C. Sutton, S. F.

312,043.—WALL PAPER TRIMMER—I. C. Van Horn, Livermore, Cal.

11,907.—TRADE MARK FOR COKE—Balfour, Guthrie, & Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COFFEE-POT.—Edwin H. Judkins, S. F., No. 311,990. Dated Feb. 10, 1885. In this coffee-pot a novel adjustable or removable strainer is placed inside and covering the base or entrance of the spout. The object is to provide suitable and convenient means within the pot itself, whereby the coffee-can be poured directly from the vessel in which it is boiled and still be clear and free from grounds.

PLOWSHARE ATTACHMENT.—Samuel Hamilton, Salinas. No. 311,980. Dated Feb. 10, 1885. This is an attachment for plowshares and a means of securing the same. It consists of a thin strip or ribbon of steel, which extends along the edges of the share, projecting beyond it and the point, so as to receive the wear. This strip is secured between the edge of the share and a supplemental plate, which is bolted or secured above, so as to act as a clamp and hold it in place.

STEP-LADDER.—Charles Brand, Oakland. No. 311,949. Dated Feb. 10, 1885. The improvements consist in the usual brace by which the folding legs are held open when in use, and a swinging platform or basket-holder jointed to the legs of the ladder and adapted to fall to a horizontal position as the legs are spread, and folded up as they are closed. The object is to provide a step-ladder having a strong and serviceable brace and an automatically acting platform, to be used as a holder for a basket in picking fruit, or for a paint can or similar purposes.

STAMPING MARGINS FOR CEMENT PAVEMENTS.—Charles Sutton, S. F., No. 312,225. Dated Feb. 10, 1885. This is a die for stamping margins in order to imitate what is known as chisel work on natural stone; and the invention consists in the peculiar formation of the die. It has been customary heretofore to simply divide the blocks of cement-work by means of a suitable tool, which by being drawn along the yet unhardened cement, cuts into it, and to make no margin or border whatever on it. In some instances, however, a line parallel to the dividing line has been made by a trowel in a similar manner, which is supposed to indicate a border; but with the manner of its formation and the character of the border thus formed it differs from Mr. Sutton's invention in that his is formed by stamping directly, and not by a draw-cut, and he proposes to make a border in imitation of such as are generally made by chisel work on the natural stone.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JAMES C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—San Benito and Monterey Counties.
GEO. MCDOWELL—Santa Clara County.
G. W. INGALLS—Arizona.
M. S. PRIME—Alameda County.
MRS. OZIER—Humboldt County.
E. G. NORTHUP, Sacramento County.
W. H. H. HUSSEY—Contra Costa County.
E. L. HUNT—Lake County.
C. M. CARR—Oakland.
W. B. TURNER, Los Angeles and San Bernardino Cos.
J. M. LOGAN, San Francisco.
F. W. SMITH, Arizona.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Partner Wanted in a Patent.

I have invented a valuable patent, which has been allowed in the U. S., and want to secure partners to take out patents in foreign countries on reasonable terms. Write to or call on J. PETTINGER, International Hotel, San Francisco, Cal.

About Obtaining Patents.

Patents are Virtually Contracts

Between inventors and the public. The consideration flowing from both parties to the contract is expressly fixed by statute. The Government requires the following consideration in every case: First, that an applicant for a patent shall disclose a new and useful improvement, of which he is the first and original inventor. Second, that the invention has not been patented, or published in a printed publication prior to the date of his invention. Third, that the invention has not been in public use, or on sale, more than two years prior to his application for a patent. Fourth, that the invention shall be properly described and claimed in the specification forming a part of the patent. Provided an inventor complies strictly with these conditions, the Government guarantees that the inventor shall have the exclusive right to make, use and sell the thing invented for the term of seventeen years.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. This question can often be answered gratuitously by us. Immediately on receiving full information of the invention, by reason of our long and extensive practice as patent solicitors and editors and publishers of first-class, scientific and industrial journals, during the past 20 years and over. When the question of priority of invention is not so readily to be determined, it is generally best to make what is termed a "preliminary examination," by searching through the patent office reports among the patents in the class to which the invention relates, and referring to our extensive patent library, containing compilations of special classes of American and foreign inventions, mechanical dictionaries, scientific encyclopedias, files of scientific and mechanical newspapers, and an immense number of patent applications by inventors of the Pacific coast, carefully filed by this office since 1860.

If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely whereby his invention has been anticipated, thereby saving him further expense and perhaps much time, useless delay, anxiety, etc.

To avoid all unnecessary delay, however, in securing patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately, and forwarded to the inventor for his signature. When the inventor receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. (This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps to be taken.) When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretence of doing cheap work, in order to entice customers to be afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give a case up as long as there is a chance to obtain a patent. The Agency charge is from $25 to $30, or some times more, if the invention is intricate or complicated, or requires much labor. Drawings cost from $5 upward, according to their number and the time employed, and, if a model is sent, the express charges upon this and the papers must be added. The total cost, in addition to Government fees, rarely exceeds $40, and for this we do all we can without appealing the case.

When the invention consists of a new article of manufacture, a new composition, samples of the separate ingredients sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are considered more satisfactory to the Patent Office than the old and more cumbersome system of storing up an immense bulk of almost numberless models.

Drawings or sketches, sufficient to illustrate clearly the invention, with a sufficient description to enable us to make a full set of perfect drawings for the Patent Office is all that we require. A model will answer our purpose as well however, in cases where the inventor can more easily furnish it for our use.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or very poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had the invention been fully portrayed by artistic and skillfully executed drawings. Again, when patents of this character are brought into court, the uncertainty and ambiguity of the drawings enable the opposing experts to mystify judges as to the construction or combination of parts intended to be covered by the patentee. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken that the invention is fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

In the Patent Office

The application is assigned to the Examiner having charge of the class to which the invention relates. The case must then take its turn with others in the order of filing, and in due time is carefully examined to test the novelty of the invention. If the examiner fails to find anything that anticipates the invention, a patent is immediately allowed, provided the specification and claims are drafted in proper form. Should the Examiner find a prior patent which, in his opinion, anticipates one or more of the claims in the application, a letter of rejection is sent to the attorney in charge of the case; and, if the attorney coincides with the views of the Examiner, the claims rejected are erased. In preparing applications for patents, an attorney should be careful to familiarize himself with the class of inventions to which the application pertains, so that the specification and claims may be drafted as nearly perfect in the first instance as is possible. This course saves much time in prosecuting the application to a patent.

When claims are improperly rejected on patents which do not anticipate the spirit or wording of the claims, proper steps are immediately taken to convince the Examiner of his error. This is done, in most part, by personal arguments, as the differences in construction, operation, function and results are more readily discovered and appreciated by an oral presentation of the facts than can possibly be done by relying solely on written arguments. In order that the Patent Office record of the patents shall be complete, an oral argument is generally supplemented by a manuscript brief, that others, in examining the files at any future time may clearly comprehend the position taken by the Examiner and attorney in prosecuting the case to patent.

In addition to our own personal attention to the interest of our clients here, we have, for over 12 years past, had constantly in association with us in Washington, one of the soundest legal counselors and ablest of practitioners in patent business in this country, who carefully attends in person to our business at the Patent Office, and has attained success in a most marked degree.

Perfect Claims.

The value and force of a patent are dependent on its claims. A patent may disclose to the public the most important and valuable invention, and yet the claim be of such meager scope that the patent is actually worthless. When the claims of a patent are so loosely drafted that infringers can flood the market with improvements, differing from the improvement disclosed by the patent only in slight changes in construction and arrangements of parts, such a patent is valueless to the owner, as it fails to afford him that exclusive and complete protection guaranteed by the Patent Law. Hence it is that the greatest care, skill and perseverance are required, first, in properly drafting the claims in the first instance, and second, in prosecuting the application before the Patent Office, and maintaining the rights of the inventor to claims as broad and sweeping as the invention will warrant. This latter is no easy task. The Examiners of the Patent Office serve in the capacity of attorneys guarding the interests of the public. It is their sworn duty to exercise the greatest care and watchfulness, that patentees do not secure claims of greater scope than they are justly entitled to. It is but natural that Examiners are sometimes in error as to just what scope should be accredited an invention. Although the Examiners act under honest convictions in cases where they refuse an inventor his just rights, yet it is the duty of the attorney to maintain the claims of his client, if he is convinced that they are just and proper. To succeed in this requires the display of tact, firmness and ability; and when the Examiner is made to see that the inventor is honestly and fairly entitled to the claims which have been rejected, he will almost invariably recede from his former action, and allow the case.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. (continuously editors and publishers of the MINING AND SCIENTIFIC PRESS, nearly from its early commencement in 1860) offer comparatively far better facilities to the local inventors of the Pacific States and Territories than are possessed by any other agents in America. Members of the firm give personal attention to the applications entrusted to their care. They have been longer in practice in patent soliciting than most agents who are still personally engaged in the business. They have secured more U. S. and foreign patents in the past 20 years (with very few exceptions) than any other firm still existing. Their practice has been so successful and long continued, that the great majority of inventions on this side of the American continent have been patented through their agency, thus affording them great and valuable experience, by thorough information of the true principles and points of novelty in the inventions, whether general in character or peculiarly local to this coast.

The extensive business combination and experience of this firm is undoubtedly one of the most fortunate in existence for affording inventors prompt and reliable advice, and the best possible facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation that is best calculated to widely inform the class of readers most specially interested in the subject of his invention.

Saving of Time, Etc.

Inventors on this coast will find that owing to our familiarity with inventions and local affairs of this coast, we can more readily and fully comprehend their wants, and thus save much of the time ordinarily consumed in preliminary writing back and forth when distant agencies are employed.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we only require a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves, or for them by other agents), who desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so.

DEWEY & CO.,

ASSESSMENT NOTICE.

Fremont Mining and Milling Company.—Location of principal place of business, San Francisco, Cal. Location of works, Amador county, near Drytown, Cal.

NOTICE is hereby given that at a meeting of the Trustees, held on the twenty ninth day of December, 1884, an assessment (No. 1) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourth day of February, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday the twenty-seventh day of February, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Sec'y.

OFFICE—No. 402 Front St., Room 8, San Francisco, Cal.

By order of Board of Directors, delinquency under above assessment is postponed to Wednesday, February 25, 1885, and the day of sale is postponed to Friday, March 20, 1885.

MARK T. ASHBY, Secretary.

DIVIDEND NOTICE.

Plymouth Consolidated Gold Mining Company, No. 23 Nassau street, New York Feb. 2, 1885.

DIVIDEND No. 21.—The Board of Trustees of this Company have this day declared the regular monthly dividend of fifty thousand dollars, being one per cent on the capital stock, or fifty cents per share, payable on February 5, 1885. W. VAN NORDEN, President.

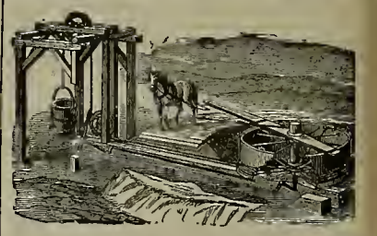
MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

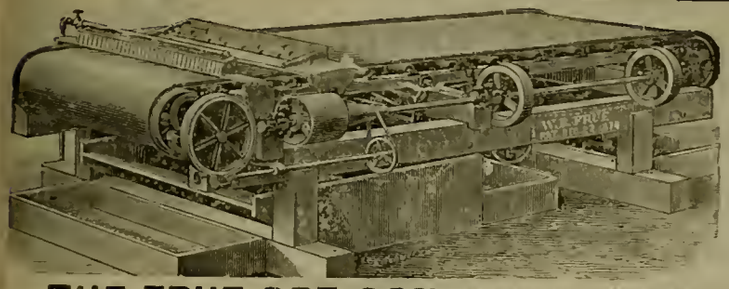
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 80 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

HOISTING WORKS

Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

SAN FRANCISCO, SATURDAY, FEBRUARY 28, 1885.

VOLUME XLXX Number 9.

The New Clayton Air Compressors.

The engraving herewith represents, in isometrical perspective, the latest improved pattern of the Clayton Duplex Air Compressors, at work at the Big Bend Tunnel and Mining Company, Oroville, Butte county, in this State. These compressors enjoy an enviable reputation for economy and efficiency, amongst the mining, tunneling, railway and engineering interests, not only in the East, where they are manufactured, but also on the Pacific Slope, where numbers of them are in operation. Shipments of these compressors have also been made to Australia, Russia, Mexico, Canada and to several of the South American republics, a "special export compressor" being made which is divisible into sections, weighing less than 300 pounds each, for easy transportation on pack mules or otherwise.

Recently these compressors have been further improved. Being of duplex pattern, with cranks set on the quarter, they admit of the location of the fly-wheel in the center of the machine, which adds to its compactness, equalizes the strain—on account of the action being direct—and by this plan a very important defect in compressors of other construction is avoided, *i. e.*, the main journals are thereby removed from the heat of the steam cylinders, which effects a great saving in wear and trouble, and an extravagant use and waste of oil in ineffectual efforts to keep them from cutting.

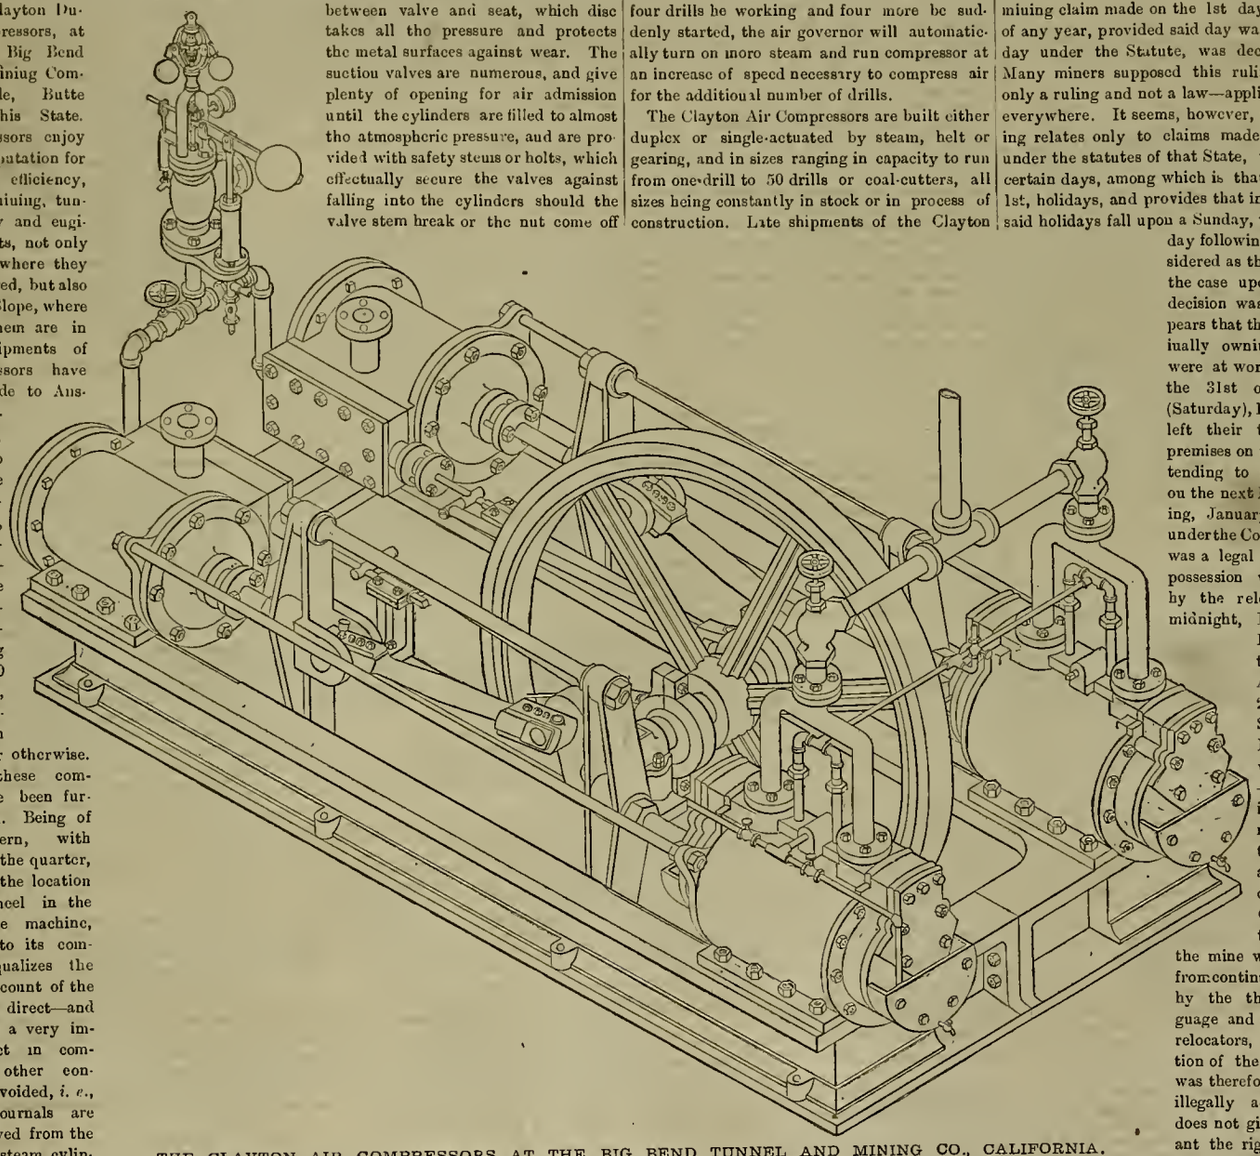
These compressors have the advantage of a long stroke; connecting rods of improved pattern are used. A heavy rod connects the cross-heads on top and a distance piece on the bottom serves as a slide, working on a long, adjustable guide, and by its use the cylinders are relieved from the weight of the pistons, rods, etc. In these machines there are no sliding valves, rotary valves, or so-called positive moving valves, for the admission of the air, as such valves produce much friction and wear and can be kept tight a short time only. All sliding valves are difficult and expensive to repair.

The induction and eduction valves are of the poppet style, are placed in the cylinder heads, and are so arranged that the valves and seatings can be inserted or removed from the outside. These valves have a slightly elastic disc, between valve and seat, which disc takes all the pressure and protects the metal surfaces against wear. The suction valves are numerous, and give plenty of opening for air admission until the cylinders are filled to almost the atmospheric pressure, and are provided with safety stems or bolts, which effectually secure the valves against falling into the cylinders should the valve stem break or the nut come off and the valve can be fastened against the seat until it is convenient to repair it. The air cylinders are encircled by water-jackets of patent design, which are so constructed as to force the water to circulate along the top to and around the ends of the cylinders, discharging from the top and thus equalizing the temperature of the cylinders to a uniform degree their entire length.

The builders of these compressors have the sole license to use the patent "Air Governor" for regulating the speed of compression and the pressure of air on the pumps, rock drills, hoisters or other machinery; thus, if 80 lbs. pressure of air is required to operate the drills, weight the lever on air governor to that pressure, and should eight drills be working and four of them suddenly shut down, the governor will close off the steam sufficiently to reduce the speed of the compressor to the amount of air required for the remaining drills. And, *vice versa*, should four drills be working and four more be suddenly started, the air governor will automatically turn on more steam and run compressor at an increase of speed necessary to compress air for the additional number of drills.

The Clayton Air Compressors are built either duplex or single-actuated by steam, belt or gearing, and in sizes ranging in capacity to run from one drill to 50 drills or coal-cutters, all sizes being constantly in stock or in process of construction. Late shipments of the Clayton Air Compressors embrace large size compressors to the Fresno Enterprise Company and Gertrude Company, California; the Copper Queen Mining Company and the Tombstone Mining and Milling Company, of Arizona; the Northern Pacific Extension (for tunneling work) and consignments to Mexico and the West Indies.

These works have issued a new illustrated catalogue, giving prices and description of the Clayton Air Compressors, rock drills, hoilers, pumps and complete plants and copies of same. Estimates and information will be cheerfully furnished on application to the Clayton Steam Pump Works, 41 to 49 York St., Brooklyn, N. Y.



THE CLAYTON AIR COMPRESSORS AT THE BIG BEND TUNNEL AND MINING CO., CALIFORNIA.

MINERS' wages for underground work throughout all the camps of Montana are $3.50 per day.

Mining Locations on Holidays.

A short time since the Secretary of the Interior made a decision in which a relocation of a mining claim made on the 1st day of January of any year, provided said day was a legal holiday under the Statute, was declared illegal. Many miners supposed this ruling—for it is only a ruling and not a law—applied to claims everywhere. It seems, however, that the ruling relates only to claims made in Colorado under the statutes of that State, which makes certain days, among which is that of January 1st, holidays, and provides that in case any of said holidays fall upon a Sunday, then the Monday following shall be considered as the holiday. In the case upon which the decision was given it appears that the parties originally owning the mine were at work upon it on the 31st of December (Saturday), 1881; that they left their tools on the premises on that night, intending to resume work on the next Monday morning, January 2d, which, under the Colorado statute, was a legal holiday; that possession was obtained by the relocators after midnight, December 31, 1881, and prior to 7:30 o'clock A. M., January 2, 1882, on Sunday, or on Monday, which was a holiday—by stealth, in the temporary absence of the applicants, and in violation of the laws of Colorado; and the owners of the mine were prevented from continuing their work by the threatening language and conduct of the relocators, also in violation of the statutes. "It was therefore a possession illegally acquired, and does not give the protestant the right to relocate the premises." Thus it will be perceived that the ruling only applies to locations in Colorado under the statutes of that State, and to the peculiar circumstances of a particular claim, and is not general in its nature. It probably means, in effect, that while doing assessment work the original owners can leave the claim on Sunday or a legal holiday without having it jumped.

A NEW mining district near Winnemucca has been organized on the east side of the Jackson Creek mountains by a party of prospectors and named Jackson District. It promises well.

THE leading silver mines are cutting down expenses in every possible way so as to overcome the heavy discount in silver.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Willow Creek Mines.

EDITORS PRESS:—Having a good many inquiries from private sources about this region I thought a few lines in your valuable paper might he of general interest to the mining public. Willow creek is on the Silver City stage road, 55 miles north of Winnemucca; the mining district is called "Rebel creek," and embraces quite a large tract of country between here and Paradise, the latter place heing about 12 miles due east from us over the mountains. The country rock is slate, with an occasional dyke of porphyry which crops out here and there among the foothills, but is seldom encountered in the mines. We have a great many ledges of quartz, running north aud south with the country rock, and all showing free gold in greater or less quantities. None of the claims have been worked enough to ascertain the extent or richness of the leads, but the samples of free gold-bearing quartz hrought iu daily hy prospectors are of such a character as to warrant a much more thorough development than has hitherto been attempted. Some of the quartz pounded up and horned out hy the miners give immense prospects, and assays of several thousand dollars to the ton are not at all uncommon, while some of the ledges are twenty to thirty feet in width. It is very hard, as yet, to speak with any certainty as to the future of these veins, owing to the very small amount of work done upon them; but if they hold out in depth as well as they show upon the surface, Willow Creek will become a power in the State, and what is now a mere stage station with a few miners' cahins scattered along up the canyon, will become a very lovely and prosperous town.

The mines now attracting most attention here are the "Wild Deer," owned by H. H. McColley, and the "Ohio," owned by the Brooklyn Mining Co., of Salt Lake, and bought hy them quite recently from the original locators. Both of these mines have true, well-defined veins, and are very likely to come to the front this season as good bullion producers. The product is mostly silver, though late assays from the main incline on the Wild Deer, at a depth of 130 feet, run as high as $80 in gold, same assays in silver ranging from $100 to $400. About a dozen men are employed in each of the above mines, and every foot sunk shows an improvement in the size and richness of the ledges. About fifty men are at work altogether in the district, and many more are expected in the spring. We have plenty of water, a fine stream running down every canyon. All we waut now is good society to make everything lovely. J. M.

Walnut Creek, Humboldt Co., Nev., Feb. 18, 1885.

Lava Creek Mining District, Idaho.

EDITORS PRESS:—The Lava Creek district, which is attracting considerable attention among Idaho mining men, is situated 70 miles south from Hailey, about two miles east of the old Champagne Station on the old Blackfoot stage road. The reports from this district are very favorable, and the few mines, which are opened, are so exceedingly rich that it sounds more like a tale from the "Arabian Nights" than reality. But we can state some facts, gathered from actual observation, which indeed fall not very far short of reports of that kind. The first mine discovered last summer was the "Horn Silver," owned hy Frank Martin. They are down on the ledge some 20 feet, where the ledge proves to be seven feet between walls, all in porphyry formation. The ore is horn and native silver, averaging $800 to $1,200, free milling. Frank Martin shipped about two weeks ago four tons of his ore to Salt Lake, which netted him $6,000. He has, we are informed, ordered a 10-stamp mill, to be in operation early in the spring, All mines on tbis ledge, towards the south are proving equally good, and the excitement is running high already, on account of the exceeding richness of the ore. There are five spleudid prospects taken up along the large croppings, which, happily, are owned hy responsible parties, who will, as we learn, go to work in earnest early in the spring, to work their mines systematically. The hest property, so far as can he judged at present, outside of the Horn Silver, is the Silver Medal, Silver Cup, and Darling, all owned by Wm. Bayhause, Prof. Delius, Joe. Feshie and others, these three mines, lying on the extreme south end of the Martin ridge. Some ore from the Darling exceeded the most sanguine expectations in assaying as high as $8,000 to the ton. Pretty near as high run assays from another mine, the Ajax, owned by Boise, Parlocs and others, this mine lying about two miles southeast from the Horn Silver mine. The country seems to be a network of rich veins, and looks like a graveyard, as an old miner said, by looking at the forest of stakes and monuments put up last fall. I will give you in tbe near future some more particular news of this new mining district, which is thought by many who have visited it to rival any other mining field on the coast. Every body is happy who was fortunato enough to secure a claim. L. P.

The Desilverization of Lead by Electrolysis.

A short time since N. S. Keith, of New York City, read before the American Institute of Mining Engineers, a paper on the above subject, as follows:

It seems proper, before describing the plant which has been erected in Rome, N. Y., for the purpose of demonstrating the practicahility of my process of refining and desilverizing lead hy electrolysis, to state in a few words the principles that govern the process. They are well-known to those who have studied electrical science, and to the practical electro-platers of the country, and are briefly these:

If we take a plate, or other form, of metal (impure lead in this case), and immerse it in a bath consisting of a solution of the main metal (that which contains the impurities), and also immerse another plate, which shall he a conductor of electricity, in the bath, but separated from the first by the solution, and connect the former plate with the positive pole of the source of electricity, and the other plate with the uegative pole, an action will go on in this bath which is called electrolysis. There is first a decomposition of the solution constituting the bath; then a solution of the metal at the positive pole (called the *anode*), and a deposition upon the other plate connected with the negative pole, which plate is technically called the *cathode*. If the hath is properly constituted, and the current of electricity which is passed through the bath is of the proper strength and electro-motive force, the dissolution of the anode and the deposition of the metal upon the cathode will he exactly equivalent. The analysis and synthesis are opposite and equal. If, on the other hand, this solution (called an *electrolyte*) be not properly constituted, decomposition will go on, hut there will be these effects: a superoxidation at the auode and a liheration of free hydrogen at the cathode, which free hydrogen escapes finally in bubbles through the liquid to the surface, and into the atmosphere. In the electrolytic treatment of metals simply for their purification and recovery, it is important that the electrolysis should be so constituted that nothing will be dissolved from the auode but that which is to be deposited upon the cathode; and the actiou should take place in exactly equivalent quantities. In this case, for a given weight of lead dissolved from the anode, a given weight of lead should be deposited upon the cathode. If not so, there will he a waste of electrical energy in the liberation of the hydrogen which escapes to the atmosphere. There is a decomposition of the electrolyte; oxygen is freed at the anode, and suh-oxides and suh-salts are then formed, which finally act to cut down the current of electricity, or, in other words, act contrary to the electrical energy. This action is, therefore, not only economical, in the way of the production of the metal, but uneconomical also, hy reason of the decomposition of the electrolyte, which should remain permanent in its constitution to avoid expense to say the least. With these principles in view, I commenced, several years ago,

A Seriee of Experiments,

As is probably familiar to the most of our members, through articles published from time to time in various journals, and papers in the *Transactions* of the Institute. These experiments were undertaken for the purpose of demonstrating the practicability of treating a material which is produced in ahundance in this country—work-lead, or "hase-hullion."

In the pursuit of this investigation I tested my solutions as electrolytes, and finally settled upon a solution of acetate of soda, in which is dissolved sulphate of lead. The chemical reasons I need not enter into here. Suffice it to say, in the use of this bath, the dissolution of the lead from the anode and its deposition upon the cathode are exactly equivalent. This condition was secured after trying many solutions, which, after a time, were found to suffer decomposition. The acetate solution above mentioned has shown itself, in many months, amounting to years, of trial, to maintain perfectly its integrity of constitution.

A few months ago, the erection of

An Experimental Plant Was Commenced

at Rome, N. Y., on a considerahly larger scale than anything I had undertaken before, for the demonstratiou to capitalists of the feasihility of this process. When I commenced the experiment years ago, electrical science and appliances for the economical production of electricity had uot reached thc preseut advanced stage. Now we seem to have approached very nearly to perfection, since we are ahle to convert mechanical energy into that form which we call electrical energy with very slight loss. Dynamo-electric machines are used which return in electrical energy 84 to 96 per cent of the actual mechanical euergy applied to them hy the belt of the steam engine. I will now describe

The Steps of the Process

To which the base hullion is submitted at this establishment in Rome, giving merely a short account of the main apparatus, and leaving to some future paper the electrical and chemical considerations involved in the process.

The metal is brought in pigs to the works, and is taken to a reverberatory furnace having a howl-shaped hearth. At the bottom of the hearth is an iron pipe leading through the outer wall of the furnace. At the end of this iron pipe, within the bowl, there is a valve which opens inward hy means of a rod passing through the pipe. The metal melted in this hearth is submitted to the action of a reducing flame produced with wood. About one-third of a cord of hard wood is burned in ten hours, and ten tons of bullion is melted in that time. Alongside the furnace is a frame which carries twelve moulds. These moulds are made to cast plates of bullion of the size 24x6x¼ inches. The frame is annular, and revolves upon rollers along the side of the furnace so as to bring the moulds (which are placed vertically on the ring) successively under the pipe from the furnace. As each mould is brought to the place, an attendant moves the valve to draw enough of the metal to fill it, and so on in succession.

As the frame is rotated, other workmen open the moulds, by turning down one side of each, and remove the plates; but before olosing the moulds they put in each some pieces of perforated copper ribbon, which, being subsequently surrounded by the metal of the next cast, serve for the suspension of the plate. The moulds are then closed, and pass on to be again filled in due succession.

After some practice the workmen cast five of these plates per minute. The average weight is 7.6 pounds, so that we get 38 pounds of metal cast per minute, or a little over a ton per hour.

The plates are then taken by other workmen and hung temporarily by the copper strips on hooks, while a muslin bag is drawn over each plate from the hottom upward. In the following operation, as the lead is dissolved from the plate, there remains a residue, consisting of the impurities of the lead, viz., antimony, arsenic, copper, iron, silver, gold and other metals. This residue would naturally drop to the bottom of the vat and become mixed with the lead. The office of the bag is simply to retain the residue.

After the hag has been drawn upon the plate it is hung upon what is called

The Anode-Frame.

This frame consists of six radial wooden arms fastened to a central cast-iron plate. Upon the outer ends of these arms there are rollers. The whole frame is a little over six feet in diameter. On the under side of these wooden arms are copper conductors placed radially, so that their inner ends are in close contiguity. To these conductors on the under side of the anode-frame are fastened twelve concentric rings, two inches apart, and upon these rings are metal hooks for the purpose of receiving the plates of bullion hung hy the copper strips. The anode-frame holds two hundred and seventy-six of the plates, which hang on the twelve concentric rings from the frame above. The anode-frame is lifted from its place of rest by a traveling crane, carried and lowered into a vat containing the eloctrolyte which I have described. These vats, of whicb there are thirty in this plant, holding each a little over a ton of the metal, are six feet, one inch iu internal diameter, and are constructed of an asphaltic cement upon an asphaltic floor, so as to make them water-tight.

There is a System of Pipes

Or conduits for the electrolyte, so that it may be conducted to each vat as desired. Thence it continually overflows the edge of the vat into gutters between the vats, and returns to an underground cistern, whence it is pumped to an overhead cistern which supplies a head to force the solution to enter the vats. In that way we obtain a continual circulation of the solution, which is necessary both electrically and chemically.

Within each vat there is also placed what is called a cathode-frame. This is built up of 13 sheet-brass cylinders, placed concentrically, two inches apart. When the anodes are lowered into the vat they pass between the separate cathode plates, so that a cathode is upon either side of each anode-plate, at the distance of about one inch. The vats are so connected with the source of electricity, that the current passes from a dynamo into vat No. 1 and up through the center of a core, two feet in diameter, built within the vat. This is built witbin the vat for two purposes: first, to sustain the copper conductor, which passes up in its center; and second, for the purpose of occupying (instead of the solution) the central part of the vat, since it would not he practicable to hring the plates in annular arrangement around the center any closer than two feet.

Each one of these vats holds 600 gallons of the electrolyte. The conductors leading to the vats are 1½ inches diameter round copper. From the inner periphery of each vat a copper conductor passes through the side and down underneath to the center of the succeeding vat, and so on over the whole series of thirty. The dynamo used is one made hy Mr. Edison for the purpose. It furnishes an electric current having a difference of potential, or an electro-motive force at its binding-posts, capable of rising to six or seven volts; but in practice we use the current up to two and a half or three volts. The current which it supplies can be varied to suit the requirements of the case, hut has been made as great as 1400 amperes, and from that to a thousand, and helow; but the production of lead is in exact proportion to the amperes of current. One thousand amperes of curreut passed through these vats enahle us to dissolve thie lead and deposit upon the cathodes at the rate of 8.5 pounds per hour in each vat; so that we succeed in treating one ton of base bullion in each vat in 10 days of 24 hours. The bullion requires no attention after being immersed in the vat, except that it is occasionally turned. This turning is to prevent "short-circuits," and can be done by means of the anode-frame having rollers upon the outer end of the arms, as described, which rollers rest upon the edges of the vat.

The Lead is Deposited

Upon the cathode in feather-like crystals, whch build out from the cathode towards the anode, and in a short time, if not disturbed, would build across, so that the current of electricity, in preference to taking a path through the electrolyte, would pass directly hy the metal, and we would cease to gain any dissolution or deposition. Hence the opsration of turning, which is now done hy means of a lever; but it is in contemplation to have the movement take place continuously hy mechanical power. After the lead is nearly all dissolved (some 5 per cent is left) the anode-frame is lifted out, the hags are removed, and the residues are washed out into a vat.

After these residues settle to the hottom the water is drawn off by means of a syphon, and they are mixed with nitrate of soda in proper proportions and fused. As a result the gold and silver are found at the bottom of the crucible, and the other metals are retained in the slag. The economical separation of these metals, such as antimony and arsenic, will be pursued. The residues, when dried, appear as a black, impalpable powder, but at the same time of sufficient coarseness not to pass through the muslin bag. They can be readily filtered from the solution through coarse twilled muslin.

This plaut, as laid dowu, has demonstrated the feasibility of the plan. It has been found somewhat imperfect, and has demonstrated all the questions which have arisen relating to economic treatment. Other vats will be built to avoid the mechanical difficulties which we have encountered. The main difficulty is one of leakage. Unfortunately thc vats were placed upon imperfect foundations, and from the weight of the solution, the metal, etc., they have settled somewhat unequally, and cracked, so that we unavoidahly lose considerable solution through the ground hclow. It is contemplated hereafter to place the vats upon a superstructure of timber that will enahle us to get at the bottom and remedy any leakage if such arise. Perhaps no leakage would have occurred in this case if the foundation had heen properly construct d.

We will give the discussion on the above paper next week.

One Benefit of Dull Times.

There is to day a feature in mining, in Nevada, says the Eureka *Sentinel*, which is hound to hring in capitalists ultimately, the inducements for their coming being too great for them to withstand much longer. What we refer to is the large number of mines which are heing worked hy the owners themselves. Many of the owners are becoming independent. In Eureka District alone there are at least 50 properties, which, a year ago, notwithstanding the better state of business then, could have been bought for one-half the amount which would be required to purchase them to-day. For instance, a man doing business on a small and losing scale in town, was obliged to go to work on a claim he owned. He was apparently irretrievably in debt, and was paying two per cent per month on money borrowed. Through good luck, pluck and hard work, he is to-day out of debt, and has sufficient money ahead to buy a good home in town for his family. Before he went to work on his mine, it could have been bought for possibly a few hundred dollars; to-day, it would take as many thousands. This is hut one of the great many cases that could he mentioned. Nor is this state of affairs confined to Eureka District or Eastern Nevada. The same can he said of the State generally. Another instance worthy of mention is that of Mr. Mills Van Wagenen, for many years a teacher in schools in Storey and Lyon counties. Having failed last fall to get a reappointment, he went to work on a claim he owned near Silver City, and he is now taking out some very rich gold-bearing rock, and is in a fair way of making a handsome fortune should the ledge hold out in depth and prove as rich as it is near the surface.

Mining in Nevada has been manipulated almost altogether in behalf of stock jobbers, but the legitimacy of the business is to-day showing itself. Witb a due allowance of caution and knowledge mining is as safe and as profitable an investment as capitalists can find, and with the turn matters are taking, it will not he long until they will fully realize the fact. "It's an ill wind that blows no one good."

A NEW LEACHING PROCESS.—Halstead Goodrich, bctter known as "Gov." Goodrich, comes to us from Pioche with a new leaching process, and claims that next to nothing will he left in the ore that is treated as he directs, says tbc White Pine *Reflex* of last Saturday. He has tried it in Pioche for a number of years on a small scale, and he thinks he knows whereof he speaks. He claims to have discoverod one of Nature's secrets hy which he can extract all or nearly all that is in the ore at a cost of less than half as at present treated. He has tried the ore around Taylor, and is freo to admit that it roadily yields to the leaching process.

MECHANICAL PROGRESS.

A Rational View of Boiler Explosions.

When the cork of a soda-water bottle is set free it escapes with considerable violence and noise. It behaves in a manner like a projectile shot from a gun. There is this difference, however, between the projectile and the cork, that the whole of the projecting work must be done in the latter after it has left the neck of the bottle. In the case of the gun, the work is done on the shot while it is moving up the barrel and acquiring velocity. The motion of the cork is extremely slow until it escapes from the bottle. The motion of the projectile from the gun is most rapid at the time it leaves the muzzle. We have a strict analogy between the flight of a soda-water bottle cork and that of a shot of boiler plate. The cast-iron top of the dome of a locomotive was, a few years ago, blown through the roof of a station. All the bolts securing the dome-top gave way, and it sailed through the air some hundreds of feet.

Now, it is very easy to say that the flight of this mass of cast-iron is readily explained. "It was blown into the air;" "It was violently forced off by the steam;" "The steam shot it off," and a dozen similar explanations may be given. But engineers do not rest content with vague statements of this kind. They see that the cast-iron must have been put into very rapid motion indeed in a very minute fraction of time, and they want to know how the motion was actively impressed on it. As soon as we begin to use figures we discover that vague generalities really convey no adequate idea at all of what takes place.

Let us suppose, for the sake of illustration, that the cast-iron dome was 18 inches in diameter, 24 inches area, and that it weighed 100 pounds. Also, we shall assume that it was projected to a hight of 100 feet. In order that it should attain to this altitude, it must have an initial velocity at least as great as that which it would acquire if it fell 100 feet. Allowing a little for the retarding influence of the air, the initial velocity must have been 82 feet per second. The boiler pressure being 120 pounds on the square inch, the total effort lifting the dome would be 30,480 pounds. We have, therefore, a force of 30,480 pounds, a velocity of 82 feet and a weight of 100 pounds. Through what space must this force operate on the weight? A very simple calculation suffices to show that the force of 30,480 pounds must act through a space of about .32 of a foot. It will be seen from this that the steam must have exerted its full pressure of 120 pounds on the square inch until the lid of the dome had been parted from it by a distance of about four inches.

In boiler explosions the same thing happens. The pressure follows, so to speak, the flying fragments for a certain distance after disruption takes places. In the same way, the column of escaping carbonic acid gas rising from the neck of a soda-water bottle imparts a high velocity to the cork after this last is quite free from the bottle. It is in this way that the projection of fragments to a great distance is brought about, and we do not think it necessary that water should be called into play for the mere projection of portions of the plates. As we should state the case, the phenomenon of a boiler explosion would be somewhat as follows: First, rending takes place through a weak joint or corroded plate; secondly, there is a violent outburst of steam; thirdly, there is a fall in pressure; fourthly, portions of the water are propelled with great violence against the boiler shell, which is shattered thereby; fifthly, the steam generated from the liberated water imparts, in the way we have tried to explain, high initial velocities to the fragments, converts them into so many projectiles, and spreads ruin around.

The point worth special notice about all this is that the steam keeps together, so to speak, and does not escape by fissures or cracks. It might be thought the moment the steam dome cover, which we have already used for the purpose of illustration, was raised at all, the steam would all rush out sideways, and that the cover would be projected but a few feet. This is not the case; the steam does not diverge to the right or left; its molecules advance, each in a straight line, behaving like a minute projectile; and this columnar advance of gas, free to diverge right or left, but going straight on, is the main cause of the violence of boiler explosions as manifested by the flight of fragments to great distances.—*London Engineer.*

THE LARGEST CONSUMERS OF IRON.—In his recently published work on the manufacture of iron, Mr. Swank says: "The people of the United States are the largest per capita consumers of iron and steel in the world, and of all the nations they are the largest aggregate consumers of these products. Our annual consumption of iron and steel has for several years averaged over 220 pounds for every man, woman and child in the United States, and has aggregated an average of nearly 6,000,000 tons. Great Britain makes more iron and steel than we do, but she exports about one half of all the iron that she makes, and much more than one-half of all the steel. We estimate Great Britain's annual home consumption of iron and steel in late years as less than 200 pounds per capita. Her aggregate annual consumption of iron and steel has averaged about 4,000,000 tons in late years, but of this quantity a large part is eventually exported to other countries in the form of iron ships, machinery, entlery, etc. No other European country equals Great Britain either in the per capita or aggregate consumption of iron and steel, although Germany now follows her very closely in both respects.

Treatment of Steel.

Methods of using steel are as many and diverse as are its users; at least, there are few steel-using mechanics who agree in all the methods of forging, shaping, hardening and tempering a tool. The writer was told recently by an old, experienced mechanic, that no turning or planing tool for iron should be drawn to temper; they should be left as hard as fire and water could make them. This was news to one who forty years ago used Sanderson's and Jessop's steels, and always drew the lathe and planer tools down to at least a straw. But, on seeing the process of the older mechanic, it was noticed that he permitted the steel to become only a dull red in the lead bath before cooling it. It is probable, also, that the steel was not so high as Sanderson's or Jessop's. It was an American steel that has come into favor within a few years.

A certain forger makes a practice of dressing a tool, after he has forged it to form, by light hammering as long as the hammer can make an impression on the metal. The hammering is continued after the color of heat has left the steel. He insists that this dressing "fines" the steel, that is, that it packs its particles and makes the grain closer. But when he tempers the tool he is careful not to heat above a dull red, and then draws to a straw color.

A manufacturer who uses mills (milling machine cutters) in his work continually will not have a mill that has not been well forged from a bar. He prefers the drop forged blanks, which are usually made from a cut-off "chunk" from a bar of square steel. He insists that the tool must be forged to form and not cut from the merchantable bar, however well adapted as to size the bar may be.

Yet another takes a bar of three-inch steel, or perhaps three and a half inches diameter, and cuts off a disk of the proper thickness for the mill he wants, chucks and drills it, mounts it on an arbor, finishes it to size, cuts the teeth and hardens and tempers it. There is not a particle of forging in the work. The same man makes taps and reamers from the bar, choosing a bar to size, and refuses to subject the steel to the hammer. He claims that even the bar commercial steel is overworked in getting it into shape.—*Scientific American.*

MAGNESIA BRICKS.—The use of magnesia bricks instead of dolomite in the process of Bessemer steel manufacture is rapidly extending. M. Ponsard, a well-known engineer, writes to direct public attention to the Schlossing process for obtaining magnesia from sea water for this purpose. Sea water contains magnesia, combined as a sulphate and a chloride, in the proportion of two kilograms of the pure substance to a cubic meter. The addition of a milk of lime throws the magnesia down as a hydrate, the chloride of calcium and a small quantity of sulphate of calcium remaining in the solution. The quantity of lime required is 1.5 to 1 of magnesia. The precipitate is afterwards recovered by filtration through fine sand.

IMPROVING CEMENTS.—W. Mills, of Bedford, finds the hydraulic or setting qualities of limes and cements are improved by mixing soluble sulphates, carbon and certain other salts with the calcined material. The patentee prefers to heat silica, iron and aluminum sulphates, iron oxide, carbon and chalk to redness in closed vessels, and then add the product, when cold, to fresh calcined lime-stone, grinding the whole intimately with some of the following salts, viz., potassium carbonate, ammonium sulphate, sodium carbonate, potassium sulphate and iron sulphate.

GRAPHITE BRICKS.—A French engineer has introduced a new refractory brick made of pure graphite, by perfectly agglomerating the powder of that substance. It is well known that graphite is nearly infusible at the highest temperature that can be produced, and this new class of bricks will doubtless prove very serviceable in metallurgy, where the want of linings which are wholly infusible has long been felt.

BABBITT METAL.—Eight parts of black tin, two of antimony and one of copper, if melted and mixed over a hot fire, form Babbitt metal. If made with care, it is one of the best materials for fast-running machinery there is.

STEEL RIVETS, ETC.—A Pittsburg iron manufacturer predicts that not only will steel nails supersede iron nails, but that we shall soon have also steel rivets, bolts, nuts and all kinds of angles and structural shapes.

THE *American Mechanical Engineer* says: "Receipts for restoring burnt steel abound; the best one we ever found was to throw the burnt steel in the scrap heap, get a new piece, and use more care in working it."

FEMALE BLACKSMITHS.—There are 347 female blacksmiths in England, all of whom actually swing heavy hammers and do men's work.

SCIENTIFIC PROGRESS.

A Sunken Continent in the Pacific.

The fact is quite generally conceded among scientists, that the probabilities are strongly in favor of the supposition that there formerly existed a large island, of continental dimensions, between the West Indies and the western coast of Africa. This continent is supposed to be the "Atlantis" of the ancients, whose recent discoveries point to the further probability that there also once existed a similar continental area of land in the Pacific ocean, between the west coast of South America and the present Australian continent, as it is sometimes called.

At a recent meeting of the Academy of Sciences of this city, Capt. Churchill read a very interesting paper in relation to this matter. His paper referred especially to the gigantic sculptured figures still to be seen upon Easter island, and evidently the work of a different race than that which now inhabits the island, and one much more numerous, since the works referred to are on too large a scale to have been constructed except by many hands. He argued that a vast continent once existed where there is now nothing but a waste of ocean, dotted with countless isles and islets of varying size and character, the majority showing in their formation the traces of that former volcanic action, which either upheaved them from the depths of the sea or shattered and sunk the continent of which they are now the only vestige. Easter island, it is believed, was once the home of a population numbering many thousands, of whom scarcely any now remain. Besides dwelling upon the sculptured figures to be found there, Captain Churchill laid much stress upon the hieroglyphic tablets of wood discovered upon Easter island, and which are the only instance of a written language in Oceanica. He thought sufficient attention had not been given them.

From other sources we learn that a German Government vessel recently visited that island and made a large collection of pre-historic remains, and made copious notes of other matters of scientific interest. The German Government, it is understood, are making preparations to send another expedition to Easter island with a corps of scientists and engineers to sketch the island, surveying the ground, and to make plans and sections of the prehistoric buildings and ruins.

Our own Government has also taken steps to secure some of these valuable remains representing the prehistoric and known races of this hemisphere. Instructions have already been sent to Admiral Upshur, in command of the South Pacific squadron, to send one of his vessels on a cruise in the direction of Easter island and to make such explorations, collections and reports as he may think important in the interests of his Government. The Government of France is also turning its attention to this island with a view to the establishment of a protectorate.

It is reported in the accounts given by the German vessel that the island, which is small, is strewn with large stone images and sculptured tablets. The inhabitants of the island know nothing about the remains, and even tradition gives no account of a people living there when their ancestors arrived.

Field of the Telephone.

Professor Bell is sanguine that the usefulness of the telephone has by no means as yet attained its natural limit. Since the recent decision sustaining the patents of the American Bell Company he has been devoting himself with assiduity to experiments intended to improve the telphone, with the idea of making it feasible to speak over longer distances than is now possible. In a recent interview with a newspaper reporter he predicted that it would in time be as easy "for a subscriber in New York to call up a friend in San Francisco, and to engage him in conversation, as it would be to call another subscriber to the telephone in the city of New York." The service between New York and Boston, by means of a circuit of double copper wire, is now said to be working very satisfactorily; but Professor Bell thinks that all wires in cities should be placed underground; that "the efficiency of the telephone cannot be fairly judged and tested in a large city, where the wires are supported on poles and buildings."

Professor Bell does not believe in the relay system for strengthening the current along the line, but believes that the sound can be so intensified at the receiver as to be heard in the remote corners of a large room. As to this point, he says: "We find this difficulty: When the sound is intensified, it is at the expense of distinctness and of perfect articulation. This fault can probably be corrected in a measure, so that if persons desire it they will be able to sit some distance from the telephone and hear all that comes through the receiver. The transmitter can also be made to convey sounds brought to it from a distance."

AN ANTIQUARIAN'S VIEWS ON EGYPTIAN USE OF IRON.—So very few articles of iron of unquestionable antiquity have been discovered among the remains of ancient Egyptian art, while objects of bronze have been brought to light in abundance, that many have doubted whether iron had been introduced in Egypt before the time of the Ptolemies. But it is very certain that other and neighboring peoples, who never reached so high a stage of civilization as the Egyptians, knew well the manufacture and uses of iron, and it is scarcely possible that the builders of the monumental works of Old Egypt should have neglected so useful a metal. Besides, there are chemical reasons why the iron remains are so few and the bronze relics so many. Yet it would seem that the ancient Egyptians had a marked preference for bronze weapons, implements and ornaments.

COAL IN THE CHICO GROUP OF CALIFORNIA.—Mr. J. S. Diller, of Washington, writes to *Science* as follows: The California Geological Survey reached the conclusion stated by Prof. Whitney, in the preface to the second volume on the paleontology of tho State, p. xiii, that the Tejon group is the only coal-producing formation in California. In the Proceedings of the California Academy of Sciences, Mr. J. G. Cooper has recently published a number of notes on the coals of the State. After remarking (vol. v., p. 385) that the Vancouver coal, and others in that region, are undoubtedly of Cretaceous age, he states that "there is still some doubt as to those of California, which may be partly or entirely above the Cretaceous strata." Last summer, while engaged in the geological survey of the Cascade range, a number of fossils were collected from the coal-bearing strata in Northern California, eight miles northeast of Yreka, on the road to Linkville, Or., and south of the cove at the Great Bend of Pit river, where considerable coal has been found. The fossils have been examined by Dr. C. A. White, who reports that they belong to the Chico group, and thus removes the doubt that some of the coal in Northern California properly belongs to the Cretaceous.

PERSEITE, A NEW SUGAR.—Muntz and Marcano have described a new sugar, obtained from the seeds of the *Laurus persea*, a tree growing in the tropics. This sugar has been observed by Avequin, in 1831, and by Melsons later; but it was by them supposed to be mannite. It is extracted by boiling alcohol, from which it crystallizes on cooling. Analysis gives it the formula $C_{12}H_{14}O_{12}$, isomeric with mannite. Its point of fusion is 183.5°-184°, while that of mannite is 20° lower. It is very soluble in hot—less so in cold water. Even in concentrated solution it has no action in the polarimeter. On adding borax, however, to a 4 per cent solution, it gave a rotation to the right of 0.55°. It does not reduce copper solutions, and is not fermentable. Boiling nitric acid converts it into oxalic acid, without the production of mucic acid. A mixture of strong nitric and sulphuric acids gives a trinitroperseite, which detonates violently by a blow, and spontaneously decomposes.—*Ann. Chim.*

THE BELL TELEPHONE IN CANADA.—The Minister of Agriculture has delivered a decision in the case of the Bell Telephone Company, of Canada, declaring the patent void, for the reason that the company or its representatives had imported the patented articles after 12 months from the date of the patent; also, for not having manufactured in Canada such articles to the extent required by law after two years of existence of their privilege, and also for having refused to sell or deliver licenses to persons willing to pay a reasonable price for the private and free use of the patented invention. This decision will not make so very much difference with the company, as they are in possession of the field, and doing about all the business there is to do, having a well-established plant in every town of importance in the Dominion.

THE LOCOPHONE.—The latest mechanical contrivance for dispatch and safety in the running of railway trains is the "locophone," which has been constructed by Frank B. Taylor, and is now being tested on the New York, New Haven and Hartford road. It is an apparatus resembling the telephone, designed to place each engineer on the road, while the trains are moving at the highest speed, in instantaneous speaking communication with the superintendent of train dispatchers. All the engineers on the road receive the message at the same moment. The circuit is made over the rails.

OLIVE OIL.—If fatty oils are cooled down to 20°, and kept at this temperature for three hours, they assume very different degrees of hardness, olive oil being the hardest. To determine this point the author uses a cylindrical iron rod, one centimeter in length, and ending below in a cone. Upon it is exerted a pressure measured in grammes, until it penetrates into the oil with its entire length. The best olive oil required a pressure of 1,700 grammes, while cotton oil required only 25 grammes.—*Serra Carpi.*

FLEXIBILITY OF LIMESTONE.—The flexibility of itacolumite—a remarkable sandstone existing in Georgia and North and South Carolina—seems to be surpassed by that of a magnesian limestone found at the entrance of the Tyne, in England. This limestone is reported to be so flexible that thin layers three feet or more in length may be bent into a circle while damp, retaining that form on being allowed to dry.

ANTI ALCOHOLIC FOOD.—Dr. Napier's investigations have taught him that macaroni, peas, beans and lentils all work antagonistically to the desire for alcoholic drinks.

Passing Events.

Aside from the information compiled in our usual mining summary, there is little new to note from the mining regions. As soon as the snow leaves our more mountainous districts the prospectors will be out again, as they are already in the milder portions of the coast.

The move to reduce the wages of miners in Idaho still attracts attention. Some of the Miners' Union men have been arrested on charge of conspiracy, because, as the complaint states, they "did, unlawfully and fraudulently and maliciously conspire, with force and arms, feloniously and injuriously to trade, to prevent any and all persons whomsoever from performing labor or mining, either for wages or by contract, or under lease, in either the Queen of the Hills or Minnie Moore mines."

The strike among the iron workers in this city has not yet been entirely settled, though most of the men are at work at the old wages. Some minor differences have still, however, to be settled.

BONDS of the Pacific Rolling Mill Company were sold this week in the Stock and Bond Exchange for the first time. The price realized was 101½.

Miners' Relief Funds.

In Great Britain they have "Miners' Permanent Relief Fund Societies" in the different districts, to aid in the frequent accidents incident to the miners' occupation, such cases having been previously dealt with by public subscription. Mine owners, though they have not contributed the full 20 per cent upon their workmen institution, have helped the funds to some extent, but they have no voice in the management of the fund, or the disposal of its benefits. The main supporters are those for whom the fund is established, namely, the miners themselves. In the term "miners" must be included the managers and other officials, for they are all eligible to membership, and in many cases they are the first to embrace the opportunity to join. From the highest official to the lowest servant, and from the oldest man to the youngest boy, every person in actual employment in or about a colliery, there is no distinction, but upon the same terms they may be admitted into the society. Although men pay only 3d. per week each, and boys 1½d., there has been contributed in the space of the first seven years the large sum of £38,378 13s. 9d., in the West Riding. These results, it must be admitted, are very gratifying as far as they go, but still there are 40,000 persons employed in the coal trade in the mine inspection district referred to, who cannot be placed in the list of those who are the supporters of the society, for they have not joined it, although it is especially designed for them, that they may every one, by its machinery, provide for their own and their families' maintenance in the event of accident befalling them.

From a little pamphlet on the subject we take the following paragraph: From the time that the first of these societies was established in 1862, to the year 1877, when the West Riding Fund began to exist the cause had advanced in the counties of Northumberland and Durham, North Staffordshire, and Lancaster, and Cheshire, until there was a united membership of about 93,000. Of this number 69,000 were in the North, and 23,000 in Lancashire and Cheshire. The remainder represented North Staffordshire, where the system had scarcely got upon its legs. The annual revenue of these three societies was then £63,150, and they held an accumulated balance among them of £76,000. Here, in Yorkshire, we for a considerable time heard next to nothing of or about two out of those three funds; it was with the first named we had chiefly to do. It astonished us not a little to find that at the end of March, 1877 (the month in which we began to enrol members), they had upon their hooks in that one society, 1,668 persons receiving a permanent weekly allowance, thus:—Widows, 314; children, 587; disabled members, 177; aged and infirm, 590; and during the preceding twelve months some 10,000 persons besides these were paid various sums allowed under the rules to members disabled for any period up to twenty-six weeks.

The Iron Workers.

Although in most of the shops the men have returned to work at the old rates, the differences between the men and employers are not all settled yet. At the Risdon works the men in one department have held out against working with one man who worked during the strike, one day, as he had done work which was not satisfactory, and when he went for his pay, was told to go and finish the work properly, which he did. It seems foolish for a hundred or more men to hold out because he was kept on. He only worked one day, and for the purpose specified.

At the Union works, the boiler makers are holding out, because the proprietors desire to keep the men who worked during the strike but these men will probably all start in next week.

The recently organized Mechanics' Union has reorganized and changed the name to the Machinists' Union, with 338 names on the role.

The proprietors state that the situation is not changed at all as regards the reduction in wages, and they will have to employ less men to keep the works going. They think it only a question of time when the present rate of wages will have to be reduced a certain percentage in order for them to compete with Eastern shops.

THE Swiss Bundesrath has rejected the naturalization treaty with the United States.

The State Minerals.

We visited the State Mining Bureau this week, before Mr. Hanks left for New Orleans with the California minerals. The museum, of course, looks dismantled, as 24 of the large, plate glass cases have been shipped, and 40 boxes of minerals. Mr. Hanks has exercised good judgment in the material taken, excluding everything not produced in this State, and taking as far as possible, typical specimens. He is desirous of making the display one of a practical nature, so that people will know what our economic mineral products really are. All ethnological and purely scientific material has been left here.

He has taken specimens of coal, iron, silver, copper, cinnabar, manganese, borax, asbestos, mica, petroleum, gold, and in fact, all such as are of economic importance. The original descriptive labels will be attached, giving name of substance, locality, etc. He has succeeded in obtaining a number of good gold specimens, which go in a special case. In addition to the specimens of ores and minerals, the county and State maps have been taken to display. Mr. Hanks thinks he will have a very creditable showing of the mineral resources of this State, and one which will attract considerable attention. It will show what mineral substances we have here, and what products are utilized.

While absent on his three months' trip, the State mineralogist will visit the gold mines of Georgia and North Carolina. During his absence the museum will be kept open in charge of the janitor, though the business of the office must necessarily cease. On his return, the whole collection will be moved from its present quarters on Sutter street, to the new Pioneer building on Fourth street near Market, where there are better facilities.

Good Mine Pointers.

[Written for PRESS by F. W. S.]

MORE satisfaction can be had out of the crushing of a few tons of ore, from a prospect or mine than can be derived from a dozen assays.

MANY mining camps in districts that produce plenty of fine milling ore and but little smelting ores, have a number of great smelters and no quartz mills. This is often the fault of Eastern companies sending out men, to manage properties, who don't know anything about ore.

IF THE district is one producing free milling ores, encourage and assist the erection of a custom stamp mill. In addition, see to it that the mill is run by an honest man.

A PRACTICAL miner who is thoroughly conversant with the characteristics of a district, can give better and less costly advice than half of the learned cranks, who claim to be geologists *par excellence*.

THE "bonding" of good mines for 60 and 90 days, or longer periods, is a very unsatisfactory thing to do. The advantage is all on the side of the capitalist and the poor miner is very much in the position of: "Heads I win, or tails you lose." It is better to sell outright or retain the controlling interest in the mine.

TRIBUTE mining is a recent and a very good system. Mine owners should guard against being too hoggish in ways of wanting more than the lion's share of the output.

KEEP posted on the general mining laws; also those in force in your own district.

BE generous, yet truthful, in giving items of interest to the editor of your camp paper or to the visiting correspondent of any mining journal.

THERE are hundreds and thousands of ore dumps in as many different districts throughout the mining States and Territories that would add millions to the outputs if custom mills, sampling works or concentrators were erected. Railroad companies could add thousands to their net earnings by giving living rates on ore, to mining men and miners.

ARIZONA contains within her borders nearly, if not quite, 38,000 square miles of coal formation, which is computed to be almost one-half of the coal areas of the United States. The beds vary in size from two inches to twenty feet.

THE Native Sons of the Golden West have petitioned the Legislature to provide the necessities of life for James W. Marshall, the discoverer of gold at Sutter's mill, Coloma.

Electrolysis in Metallurgy of Copper.

Probably the first instance of the application of electrolysis in metallurgy was in the production of "cement" copper in the wet process of treatment. In certain mines the drainage water is often found charged with sulphate of copper, which is the result of the oxidation of the sulphide in the ore. It is from these solutions that the cementation copper is produced. The wet process is particularly adapted to the treatment of the poorer oxidized ores, especially where fuel is scarce. These ores are treated with acid, either hydrochloric or sulphuric, or with ammonia, all three of which are good solvents of the oxides of copper. The precipitation is effected in the copper solution by placing iron in it. The action is the result of electrolysis.

When a piece of zinc or iron is plunged into a solution of copper its greater affinity causes it to combine with the acid holding the copper in solution, and the copper becomes deposited on the zinc or iron. When a portion of this piece of electropositive metal is covered with the electronegative copper, galvanic action begins, the current starting at the electropositive and going to the electronegative. The solution is electrolyzed; the iron is dissolved and the copper is deposited.

After this the action is entirely electrolytic, and it corresponds exactly with that taking place in the gravity cell, where the copper is deposited from the solution and zinc is dissolved by the acid to replace it in the solution. The character of the deposited copper depends on the current, and the current depends on the strength of the solution. In precipitating the copper from the solution, pieces of iron are placed in the large vats containing it. The copper is, as a rule, deposited in a soft, plastic form, whence the term "cementation copper."

Buried Under the Gneiss Drift.

It is a peculiarity of some of the best ledges in the Washington district, Nevada county, now attracting so much attention, that they show no indications of their presence on the surface, being completely covered by the decomposed gneiss which forms here one of the country rocks. This accounts for the fact that these ledges escaped for so long a time the notice of prospectors and others, the placers in the neighborhood having been extensively worked for many years. Owing to the manner in which they are covered up, the discovery of many of these ledges have been purely accidental. The finding of the Selina, one of the richest of their number, is said to have happened in this wise: A miner one day, stopping to rest near the spot, saw a piece of float rock, which, picking up, he proceeded, after the habit of miners, to crush and examine for gold. Finding it rich in that metal, the next thing was to determine where it came from. To this end he ran a number of trenches, one of which struck the apex of a blind ledge. This ledge, prospecting well in free gold, was located and afterwards very thoroughly opened up by means of shafts sunk in the vein matter, besides being traced and uncovered for a distance of about 400 feet. Though not over 16 inches wide on top, this vein has at the bottom of the shafts sunk on it an average width of fully two feet, and it is thought will expand to three times that width in the course of sinking another hundred feet.

This ore is uniformly of high grade, what has been worked thus far having yielded $29 per ton, and it is calculated that the contents of the fissure from wall to wall will mill $25 per ton. Should it do this, the Selina will be one of the big mines of the State. Hoisting works and a mill go up on this ledge in the spring. The Yuba, Eagle Bird, Star and Lindsey, all proven properties, are on the same mineral belt as the Selina, and like it, belong to the system of "blind" leads, being buried under several feet of gneiss debris. Though difficult to find, this class of veins is much sought after, being exceptionally rich in gold.

AT the annual election of the Mechanics' Institute on Tuesday evening the following trustees were chosen to serve for two years: C. F. Bassett, Byron Jackson, C. Waterhouse, James Spiers, George Spauldiog, John Mallon, Joseph R. Wilcox.

WORK has been commenced upon a graded boulevard between Los Angeles and Pasadena.

The Wolf Miners' Safety Lamp.

At a recent meeting of the Manchester Geological Society the Wolf patent safety lamp for miners' use was exhibited and explained. This lamp is constructed to burn benzine. Figure 1, of the accompanying engraving, shows the general appearance of the lamp. For the use of benzine in these lamps the following advantages are claimed, as compared with oil: It will give a much clearer light, of more uniform intensity; it does not produce any lamp black or soot to clog the parts of the lamp, and by reason of its cleanliness a much finer gauze can be employed than is generally used in oil lamps, which considerably increases the safety of the lamp from fire-damp: it is also perfectly adapted to denote the presence of fire-damp, since, when the latter increases to a dangerous extent, the lamp goes out, whilst in the case of so called "black damp," the benzine flame will burn long after an oil lamp would have gone out for want of oxygen. A further advantage in the use of benzine is that it is much cheaper than oil. The novel lighting arrangement of the lamp is illustrated full size in Figs. 2 and 3. By simply inserting into the lamp a priming or percussion strap, which is exploded by the action of a spring operated from outside the lamp, it can be relit about 75 times without reopening, and in the event of the lamp being extinguished from accidental causes the miner is not compelled to travel back to the lamp station.

While this arrangement removes the temptation for any malicious re-opening of the lamp, a locking arrangement is provided, which renders it impossible for the miner to open the lamp except by means of a powerful special magnet kept at the lamp stores for the purpose. Fig. 4 represents a locking device of an older and somewhat modified construction, located in a case or shell attached to the screw ring of the lamp, and Fig. 5 shows the latest and best arrangement, which is inserted between the two parts of the screwed portion in such a manner that no damage or clogging of the parts is possible.

The magnet used in opening the lamp is shown in Fig. 6. To effect the opening of the lamp it is placed upon the movable brass disc attached to the wooden stand. Then the name plate of German silver affixed to the lamps is turned towards the magnet, so that its right-hand part may lie in the recess of the magnet. It will then suffice to turn the base of the lamp somewhat to the left, and hold the top part of the lamp with the left hand, so as to unscrew the lamp by further turning it to the right.

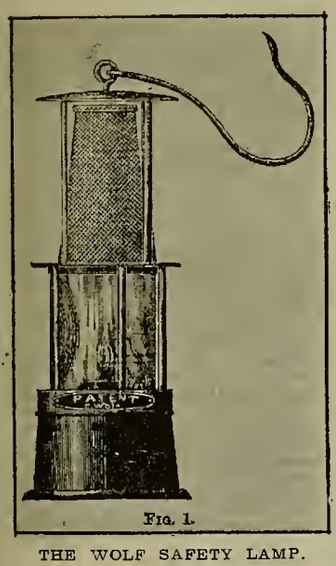

FIG. 1.

THE WOLF SAFETY LAMP.

For charging the lamps with benzine a very ingenious apparatus has been arranged, which is shown in Fig. 7, and which effects the filling of the lamp in an economical manner without risk of danger. The illustration may be described as follows: A is a reservoir of a cylindrical shape, and capable of containing 50 pounds of benzine. It is provided at the top with a screw cover, upon which the apparatus being filled is tightly closed. On one side, at the lower end there is a cock surmounted by a glass vessel. This cock has three ways; by turning the key upwards the glass vessel (B) is filled with benzine, sufficient to charge one lamp, so that it may be used during one shift. If, therefore, the open cup of the lamp be placed under the outlet of the cock, and the key of the latter be turned into a horizontal position, the cup of the lamp will only receive that portion of the benzine which is contained in the cylindrical vessel, while the benzine contained in the main reservoir remains separate. It sometimes, however, so happens that the benzine in a lamp is not fully consumed within a given time, so that the whole of the contents of the glass vessel cannot be held in the cup of the lamp. To meet such an emergency, the filling apparatus is so arranged as to automatically stop the filling operation upon the lamp being sufficiently fed with oil, without any necessity of shutting the cock by hand, so that there can be no overflow or excessive filling. Mr. Budenberg also exhibited an apparatus for efficiently testing each lamp before it is handed to the miner. This consists of an apparatus for generating gas, which is passed into a testing cylinder made of sheet iron, provided with a glass, and containing a pipe, extending upwards in a serpentine shape, and provided within its coils with small apertures. The cylinder also contains orifices or slots at its lower end for the admission of atmospheric air, which can be regulated by means of movable metal rings. When the lamp is to be tested, it is, on being lit, inserted within the coiled pipe in the cylinder, and the gases are allowed to reach the lamp through the small holes in the coiled pipe. Should the lamp be defective the gases will ignite within the cylinder, while if the lamp is in a proper condition the flame of the lamp will be extinguished in consequence of the inflow of gas or manifest the same phenomena as are observed with fire-damp if only small quantities of gas are admitted into the cylinder. The *Colliery Guardian*, from which we take these statements, adds that at the final trials at the Aldwarke Main Colliery, near Rotherham, the Wolf lamp stood the test of a velocity of 51 feet per second; in no case was the glass of the lamp broken, and it was remarked that the flame proved exceedingly steady, the clearness of the light being generally noticed.

ARRANGEMENT FOR LIGHTING THE LAMP.

Dedication of the Washington Monument.

One of the great events of 1885 is the completion of the Washington monument, and its dedication to the purpose for which it was designed, and for the completion of which a term of 37 years has been required. The dedicatory exercises took place on Saturday, Feb. 21st, that day being accepted at the National Capitol for the celebration of Washington's birthday, as the 22d fell on Sunday. The telegraph brings an account of the dedicatory exercises, which were eminently fitting the occasion.

Last Saturday in Washington was a raw and blustry day and yet a large concourse defied the elements and assembled at the base of the monument. After music by the Marine band the Masonic ceremonies by the Masonic Grand Lodge of the District of Columbia were conducted under the direction of Grand Master Myran W. Porter, in which certain historic relics with which General Washington was intimately connected were brought into use.

Senator Sherman and W. W. Corcoran delivered suitable addresses. Then Colonel Thomas L. Casey, of the engineers, in a few appropriate words, delivered the monument to the President of the United States.

The President read his address in a firm and clear tone and at its conclusion cheers broke forth and were hearty and prolonged.

Afterward there was a grand civic and military procession from the monument grounds to the capitol and the exercises were continued in the hall of the House of Representatives.

In the Hall of the Representatives there was a notable gathering, including the President and Cabinet, the Supreme Court, the Diplomatic Corps, and the Senate. The exercises included patriotic music and orations. At night there was a grand display of fireworks on the Capitol grounds.

The foundation of the Washington Monument was laid July 4, 1848. As just completed it is a hollow shaft of granite faced on the outside with blocks of white marble, and 555 feet high, making it the loftiest structure in the world.

A comparison with the other noted artificial elevations of the world will readily convey to the reader the wonderful dimensions of the monument. The nine highest in the world are as follows: First, the Washington Monument, 555 feet; second, the Cologne Cathedral, 510 feet; third, the great pyramid of Cheops, 460 feet; fourth, St. Peter's Church at Rome; 448 feet; fifth, St. Paul's Church, London, 360 feet sixth, St. Mark's Church at Venice; seventh, the Capitol at Washington, 283 feet; eighth, the Brooklyn Bridge Tower, 276 feet; ninth, Trinity Church, New York, 263 feet.

The apex is a pyramid of white marble, topped with metal and a lightning-rod. The dizzy hight may be reached by an elevator within the monument. The States of the Union, and in many instances cities, as well as numerous foreign countries, are represented in the obelisk, and California did not forget to contribute a memorial stone, as was described in the PRESS last week.

A NUMBER of farmers at Santa Rosa are setting out walnut trees for timber.

Assaying.

Qualitative Tests for Ores.

In Walter Lee Brown's Manual of Assaying, published by Jansen, McClurg & Co., of Chicago, he gives a few simple tests for some of the metals, and acids united with them, as found in ores.

Ordinarily these tests work better on the powdered ore, though sometimes, as will be mentioned, the original rock can be directly treated.

Carbonates.—Place a drop of any strong acid upon the suspected rock; if effervescence (or boiling up) ensues, unaccompanied by any odor, it contains carbonates. This test does not always show well with small quantities of carbonates; try then some of the powdered ore with acid in a test-tube. To confirm the presence of carbonic acid, suspend in the test-tube a glass rod that has previously been dipped in lime-water; the drop on the rod should become turbid or milky, owing to the formation of carbonate of lime.

Place a small sample of the pulverized ore in a test-tube, add to it some nitric acid, a little more than will cover it, and heat till the acid does not seem to dissolve any more of the ore; let cool, after which add as much pure water as there is acid, and shake and filter.

Sulphates.—To some of the filtered acid solution add solution of chloride of barium (or, if lead be present, of nitrate of barium). A white cloudiness or precipitate (which does not instantly form in dilute solutions) shows the presence of sulphates.

Sulphides.—To a piece of the rock, or to some of the powdered ore, add a drop of nitric acid. If sulphides are present in any quantity, a strong odor, similar to that of rotten eggs, will be given off.

Tellurides.—Take a small piece of the ore and place it on the cover of a porcelain capsule, and heat with the inner flame of the blow-pipe for a couple of minutes. Now place a drop of concentrated sulphuric acid on the cover, and let it slide down to the heated fragment. As soon as it touches or approaches very near the ore a beautiful carmine coloration forms, strongly contrasting with the white porcelain. As the latter cools, the color fades. Any white crockery, as a piece of a broken plate or saucer, will do to use in this test.

Copper.—To a piece of the rock on a white porcelain surface add a few drops of nitric acid and stir. Add now an excess of ammonia water. If the mass turns blue or copper, its compounds are undoubtedly in the ore. If the latter contains much copper, a polished knife-blade dipped in an acid solution of it will receive a coating of metallic copper.

Iron.—If, at the same time the solution treated with ammonia turns blue, or even if it does not do so, there appears on the porcelain or in the test-tube, a reddish-brown gelatinous mass, then iron is present.

As further tests for iron, on one part of an old plate put a crystal of sulphocyanide of potassium, and on another a lump of ferrocyanide of potassium (yellow prussiate of potash); now pour on each a little of a hydrochloride acid solution of an ore containing iron; a blood-red coloration with the first-named re-agent, and a magnificent blue precipitate with the second, prove conclusively the presence of iron compounds. Of course these tests can be shown with the filtered solution in test-tubes.

Lead.—Drop a little nitric acid upon a piece of ore supposed to contain lead, then add a little water, and finally a crystal of iodide of potassium. A bright yellow precipitate will form if lead is present.

Silver.—If this metal is in any appreciable quantity in an ore, it will dissolve in nitric acid (excepting the chloride ores). To the acid solution, add a little hydrochloric acid, solution of common salt, or even a dry grain or two of the latter. A curdy, white precipitate of chloride of silver is thrown down, which is not soluble in water (as is chloride of lead on the contrary), but dissolves easily in ammonia water. The precipitate turns black on being exposed to light.

As stated above, chloride ores do not dissolve in nitric acid; therefore when they are suspected to be present, put some of the powdered ore into a small bottle, pour in a small quantity of very strong ammonia water, cork up the bottle and let it stand for a few hours. Then add, in slight excess, nitric acid. The white precipitate of silver chloride will at once come down if there is any in the ore.

The best test for gold is the fire assay. To learn the colors and appearances of the tests above given, try them on the following substances:

Carbonates	Bi-carbonate of Soda.
Chlorides	Common Salt.
Sulphates	Sulphuric Acid.
Sulphides	Copper or Iron Pyrites.
Tellurides	Any Telluride Ore.
Copper	Copper Wire.
Iron	Nail or Wire.
Lead	Sheet Lead or Galena.
Silver	Silver Foil and Horn Silver.

Consult the books on qualitative analysis for further information or tests.

DAILY YIELD INCREASING.—The daily average of ore taken from the Yellow Jacket, Crown Point and Belcher is largely on the increase. These three mines are now producing over 500 tons of ore per day. A train of 70 cars loaded with ore from the above three mines leaves Gold Hill every day for the mills on the Carson river.—*Virginia Chronicle.*

Minerals Accompanying Tin-ore in the Black Hills.

The following paper, by Professor Charles A. Schaeffer, of Cornell University, was read before the American Institute of Mining Engineers:

Several months ago, some specimens of the minerals occurring at the Etta tin mine, Dakota, were received at the laboratory of the Cornell University. On examining the heavy brownish-black portion, which I presumed was the tin-stone, I was surprised to find only a faint indication of tin. Further investigation showed the mineral to be tantalite. On searching carefully all the fragments received, a considerable quantity of that mineral was found, and only a single streak of cassiterite, which was attached to a mass of spodumene.

Another lot of specimens, from the same locality, consisted of samples of the greisen, some garnets, and a quantity of "stream-tin." The latter sample weighed about 500 grammes, of which about one fourth consisted of small, pinkish garnets, averaging about the size of a grain of mustard-seed. The remainder comprised a lot of rounded brown pebbles, averaging in diameter a quarter of an inch. These were carefully examined with the blowpipe, and of 30 pieces six proved to be tin-stone; one, the largest of the lot was hematinte; and the rest were tantalite. No wolfram was found in any of the specimens, and I think it is a fair inference that the heavy black mineral to which Professor Blake alluded in his paper as "apparently wolfram," is tantalite.

An analysis of the tantalite gave the following results:

	Per cent.
Tantalic oxide	79.01
Stannic oxide	0.39
Ferrous oxide	8.33
Manganous oxide	12.13
	99.86

Specific gravity, 7.72.

So far, I have been unable to find the least trace of columbic or tungstic acids, or of any of the rarer metals. The Dakota tantalite is thus much simpler in composition than the mineral from Alabama, which, according to the late J. Lawrence Smith, contains tungstic acid, as also oxides of zinc and copper in small amounts.

Pressure of other work has prevented me from analyzing additional specimens of the mineral; but I think it highly probable, from the fact that the color of the powder differs more or less in the different specimens, that they would give results varying somewhat from the above figures.

A third lot of minerals from the same locality, received from a friend who obtained them at the office of the Harney Peak Mining Company, in New York city, presented precisely the same appearance as the specimens that I had received directly from the Etta mine, except that in the massive specimens the tin-stone was present to a very encouraging degree, though the tantalite was by no means absent.

In a report made to the above-named company, by Professor Gilbert E. Bailsy, the following passage occurs: "No titanic acid, wolfram, sulphur, arsenic, or other injurious substances were found in the ore."

So far as my knowledge goes, there may be no wolfram present, but there must be, instead, a very considerable amount of tantalite accompanying the tin-ore. As to arsenic, the first lot contained two large lumps of scorodite,—remarkably good specimens,—with here and there kernels of leucopyrite. Further, one of the massive specimens of tantalite contained two little cavities which were filled with olivenite. From this it seems that arsenic does occur in at least three of the minerals which accompany the tin-ore. By proper concentration, however, it will be a very simple matter to remove the most of these arsenical minerals from the ore. But how to separate the apparently large amount of tantalite from the tin-stone is a matter which will, I believe, prove puzzling to the wisest metallurgist.

ABOUT NEW RIVER.—"Would you go to the New River mines if you were in my place?" asked a young fellow of this writer this morning. We answer: If we had nothing to do here and had the money to go to New River on, and enough of it to bring us back in case that we did not like the way things looked after we got there, we should go to New River. We would not throw up even a small business so as to enable us to go to new mines. New River is not so very far away, and it is in a mining country. It has the quartz, and the country rock is about like that of Grass Valley district. There will be some paying mines in New River; nothing big like the Comstock. Travel is good for a man, and one who is idle and can pay his way had better do some traveling. Of course there are numbers of "Old Prospectors" who will write to the newspapers that New River is all a humbug. The "Old Prospector" used to write that way about the Comstock. That same "Old Prospector" is the bane of every established mining camp, for he is the fellow who is telling capitalists not to invest in mining. Of course "Old Prospector" is against any new ventures. For the good of the mining business generally "Old Prospector," who writes to the papers, ought to have died years ago, but he never will die. We would chance a reasonable amount on a trip to New River if we were the young man who asked us about it. The trip will do him good.—*Grass Valley Tidings.*

The Kind of Men Miners are.

The condition of the ore miners of Colorado is vastly superior to that of the same class of people in other mining sections. Wages are remunerative, because there is a good margin left over the cost of the necessaries of life. Mining here may be regarded as skilled labor since the price paid for such work exceeds the compensation received for many kinds of labor properly classed as skilled. Miners' wages, as a rule, are higher than clerkships, even drug clerkships, and on a par with the salaries earned by the sleek gentlemen who concoct exhilarating beverages behind gorgeous sideboards. Blacksmiths and watch-tinkers command somewhat larger pay, but do not have corresponding social rank. No form of manual labor equals that of mining when both remuneration and social standing are considered. There are numerous instances in which the poor miner of last year is the capitalist, legislator or society favorite of the present year. The Colorado miner springs from clay susceptible of the highest polish, at least in his own estimation, and we find him springing continually from obscurity and ignorance to prominence and position hitherto supposed to require years of patient and persistent preparation. The wonderful transformation of the crawling caterpillar into the brilliant-hued butterfly sinks into utter insignificance before the lightning changes of the honest miner to the guilded shapes he is constantly assuming. It is not known whether the butterfly ever boasts that he was once a repulsive worm, but it is an established fact that the miner never reaches a position so exalted that it prevents him from referring with pride to his chrysalis familiarity with the pick and shovel. There is a spirit of hopefulness and ambition associated with mining that begets manliness and independence of character beyond that of any other calling in which manual labor is as important a factor. It is intrinsically an attractive labor, out of which longer persimmon poles and mightier levers may be rested by the hands in a day than brains could evolve in a life time, and hence we find in the business more brainy than brainless devotees. It will be a national calamity when miners wages are reduced and the honor whether merited or not, that attaches to this form of labor is unrecognized. In contrast with the honorable standing and happy condition of our own miners let us place the lot of the toiling, helpless masses who work in the mines about Freiberg, the mining and smelting center of Germany. There the miners and smelters eke out a miserable existence. They generally have large families and receive 25 to 50 cents a day, living chiefly on potatoes, rye bread and chicory, which is a substitute for coffee, and indulgs in the luxury of meat only once a week. They look pale and emaciated and labor often at depths of 2,000 feet below the surface of the earth. The children of such men are sad, expressionless and often deformed specimens of humanity. How they would brighten up and be happy if their food was of the quality used by our miners, even with no other amelioration of condition and prospects. Loyalty, liberty, liberality and good government will grow and strengthen and be upheld always when the masses have the hopes, aspirations and instincts possessed by our honest miners.—*Denver Tribune-Republican.*

Mines in Sandstone.

A recent dispatch says that the reports of new and rich gold strikes in the Henry and Elk mountains, near the Colorado river, San Juan county, U. T., are abundantly confirmed by the receipt in Salt Lake of numerous and exceedingly rich ores, carrying free gold, telurium and native silver. The outlook is that there will be a stampede of miners and prospectors from the mines of Northern Utah to the new discoveries. The ore runs from $250 to $9,000 to the ton.

A miner, who doubtless understands the character of the alleged finds, and who has evidently a fair knowledge of the formation of the section where the strike is said to have been made, writes to the Salt Lake *Tribune* and advises prospectors to go slow on the boom. He says: "Silver mines in a sandstone formation, in mining parlance, are very treacherous, and spotted similarity of ores is in criterion for determining the value of ores as in other formations. So far as I am informed, Silver Reef is the only place where mining in sandstone has been a success, and the pay portion of that district is confined to a very small limit.

East and northeast of Silver Reef, and south, southwest and southeast, are beds or reefs of silver-bearing sandstones, similar in almost every characteristic to the Silver Reef ores, except that they carry only a small per cent of silver—not enough to pay for working.

"As a rule, so far as my observation goes, the more copper you find in the sandstone ores the less silver you will find. Still, this rule may be reversed in some new locality. The silver sandstone mines near the Lower Crossing of Price river boomed for a short season and are now almost forgotten. Then we have right here, within five or six miles of this city, beds or reefs of silver-bearing sandstone, strongly impregnated with copper, but carrying a very small percent of silver. I am informed by men who have traveled and prospected over a large portion of Southeast Utah, Southwest Colorado and Northern Arizona, that the country is full of these silver-bearing sandstone beds. A few years ago there was a stampede to the Pahreah country, east of Silver Reef, after silver sandstones, but they didn't pan out worth a cent. It turned out to be a premeditated fraud, gotten up to make a few dollars before the thing could be exposed.

"I hope the sandstone, copper-gold-silver ores of White Canyon will prove as rich as some of the assays indicate. Nothing would do Utah so much good as to have a big mining boom based on intriusic merit—one that would attract capital to the Territory.

"I would advise miners to go a little slow on this new sandstone region, and await further developments. If the mines are as spotted as the assays of the hand samples indicate, there will be many blanks and few prizes."

A GOOD WORD FOR THE SILVER DOLLAR.—The New York *Sun*, in answer to the question "Will the silver dollar work injustice," says that it will neither cause a financial crash nor produce stringency nor injure labor interests. The only serious question is that regarding contracts now existing, made upon express or implied assumption that they were to be fulfilled in gold. The *Sun* takes sides with the silver advocates as to the relative value of gold and silver when gold contracts were made, arguing that silver dollars have not depreciated, but that gold has advanced, and instances this general cheapness of raw materials and the necessaries of life, compared with their cost seven years ago. Much of the decline, no doubt, is due to increased production and an improved process of manufacturing, but the fact remains that 85 or 83 cents in gold will buy more food, clothing and other articles of daily use than $1 in gold would have bought in 1878. The man who lent gold then and gets it back now is really getting more than he parted with. Statistics which show the decrease of gold production and its increased absorption in manufactures also show that the silver production has remained stationary at about $100,000,000 annually since 1879.

GO PROSPECTING.—It would seem that just now is an opportune time for the further development of the many idle claims in this mining district. Many of them have had enough work done upon them to demonstrate the existence of ore, and that in paying quantities. Here would be an excellent chance for many of those here who are seeking work to lease or enter upon a tributing proposition to further develop any one or more of the better properties. The latter plan is a feasible one, now that milling can be done much cheaper than in past years. Any man, who is any judge of the ores of this district, can make his board, which is more than striking the superintendent or foreman for a job every day will bring him, and has the chances of finding something that will pay him much better.—*Candelaria True Fissure.*

GOLD AND SILVER.—The attitude of the East on silver demonetization has caused many of the miners of Colorado to seek the gold fields. This fact has been and will be a good thing for Clear Creek, Boulder and Gilpin counties, as many old miners have turned their faces toward these old mining districts. The gold belt of the Rocky mountains, beginning northeast of Boulder county, passes to the southwest, through or near Nederland, Rollinsville, Black Hawk, Central, Russell, Idaho Springs, Dumont, Lawson, Red Elephant mountain, Covods mountain, Empire City, North Empire, Georgetown, and so on to the northwest. This belt will witness much activity during the coming few years.—*Georgetown Courier.*

THE EXCELSIOR MINE SUIT.—The famous suit of Frank T. Butler, assignee for 11 holders of stock of the Excelsior Water and Mining Company of California, against James B. Haggin, Director of the Company, and others, has been concluded. Judge Van Brunt dismissed the suit as against the others. The court in its charge said it was for the jury to determine whether the purchasers bought the stock during the time Haggin was a Director, and if they bought it, believing it to be dividend paying. The jury gave plaintiff a verdict for $6,801. The case will be appealed. A large number of experts testified in this suit.

A WOOD RIVER MINERS' UNION publishes the following card: We will sustain miners' wages within the limits of Bullion and Bradford mining districts at $4 per day, in United States gold coin or its equivalent, and will firmly and perseveringly oppose any effort on the part of any person or persons to reduce the miners' wages to less than the above-stated rate. We caution miners who may hear that miners are in demand here, not to come until the difficulty now existing between the mining companies and the miners at Bradford is settled.

AT QUIJOTOA, Arizona, grading has been commenced for a mill, and will be pushed along as rapidly as possible. The contract has been let to William Tweed for hauling the mill from Horshaw. The well in the valley is down 300 feet; water is reached at a depth of 400 feet. They expect to have an abundant supply within three weeks.

ENGINEERING NOTES.

The Strength of Brickwork.

The torn aed ragged keyless arches and baseless walls of ruined abbeys, the partially demolished houses on the track of some new railway or road, and many other equally trite instaeces might be cited as standing evidences of the truth that good masonry or brickwork will resist with energy, not only crushing, but breaking across, and tearing, twisting, or shearing asunder. No wouder, then, if the first element alone be included in the calculation, that many a brick structure whose fall has been prophesied refuses to acquiesce in the false laws of the prophet. The prophet's dictum might probably be justified by the result if full work were imposed upon the structure before sufficient time had been allowed for the full development of all the powers of brickwork, but the experienced practical builder never loses sight of this condition, but by the use of cement in some places, and of props and supports in others, gives the brickwork the necessary temporary aid, and so insures success. Many cases of this class are to be met with in small country towns, where the town hall is carried upon arches and piers in order to afford space for a market underneath. These buildings do not tumble down, and as country builders reproduce the type coetinually, it is by no lucky chance that they escape. The country builder is wiser than his critics: he does not aim at making an arch except in appearance, for he has no abutments, but he takes special care to put his work together in such a manner as to insure his getting a serviceable and reliable brick beam.—*Eclectic Engineering Magazine.*

Water Power for Cities.

In London the plan of distributing water power in pipes for manufacturing purposes, running lathes, elevators, etc., is now in successful operation. The franchise is owned by the General Hydraulic Power Company. The water is taken from the Thames, filtered through sponge filters, then forced through the pipes by steam power. There is a pressure of 700 pounds to the inch in the mains. The mains which now measure in the aggregate seven or eight miles, are cast iron pipes six inches in diameter; yet they are cast in nine-feet lengths, and are tested to 2,500 pounds per square inch at the works. The joints are turned and bored spigots and sockets, and are made tight with gutta percha rings, the necessary pressure being obtained by 1¼-inch bolts passing through the lugs on each pipe. As each section is laid, the water is admitted to test the joints; and after that, if they are tight very little more trouble is experienced. Stop valves are inserted every 400 or 500 yards, and by their aid the position of a leak can be located within that distance, after which it is easily found. The financial success of the company is no longer a matter of doubt. Since January 1st of the present year, the amount of water delivered has increased 40 per cent and would be much greater if all the intended consumers had their machinery in place. The charges for power are based upon a minimum payment of 25s. per quarter for each machine, and a sliding scale for the water, which is measured by meter as it is exhausted. In many cases the cost of lifting by the company's power is as low as a half-penny per ton lifted 50 feet high.

FROM LONDON TO BOMBAY BY RAIL.—He is a bold man, says "Invention," who in these times should object to any engineering scheme that it is impossible; being the newest project of rapid traveling is sufficiently startling, being none other than a railway route from London to Bombay. The idea emanates from a number of English and French engineers acting in concert, and even the smallest details are said to have been carefully worked out. The whole of the journey will be accomplished by train save the passage of the Channel and the crossing of the straits of Gibraltar. From Tangier the railway would run across Morocco and make a junction with the Algerian lines, afterwards continuing by Tunis and Tripoli to Cairo. Thence the line would continue along the Euphrates valley and the shore of the Persian gulf to Karrachee, the extreme westerly point of the Indian railway system. It is not surprising to hear that the cost of the undertaking would be ten millions sterling. Quick trains, three of which would be run weekly each way, would cover the distance between London and Bombay in nine days, while slower trains starting daily would take a day or two longer.

COTTON COMPRESS.—Columbus, Georgia is to have a cotton compress to facilitate shipments of cotton from that point. It appears that 24 bales of country packed cotton fills a car, while as much as 50 bales of compressed cotton can be placed in one. The severe compression of cotton greatly reduces the cost of its transportation; but it also seriously injures its quality.

THE HUDSON RIVER TUNNEL has not been abandoned, as some have supposed. Work was temporarily suspended chiefly on account of the death of one of its chief promoters—Trenor W. Park. Work will be resumed as soon as the present general business depression has passed away.

USEFUL INFORMATION.

TO BONE A TURKEY.—It is not very easy to bone any bird from written directions, and a turkey is rather a serious thing to spoil. There are two ways of boning. Knives are sold for the purpose, but a sharp pocket knife will do. Lay the bird on its breast, and cut through the skin along the middle of the back. Keep the knife always close to the bone, and cut away the flesh on either side, turning it back as you go. Cut through the joints of the leg and wing bones, and keep cutting till you have separated the breast-bone, when the whole of the body will come out intact. The legs and wings are rather more difficult, but the only thing is to cut very carefully, and on no account to pierce the skin, turning the skin and flesh inside out, like a stocking, as you go along. The legs should be cut off at the first joint, and the last bone of the wing is sometimes left in. When all the bones are out, fill the bird with tongue, stuffing, chestnuts, or whatever else you may have, remaking it, as far as may be, into the shape of an unboned bird. Some persons prefer to lay it flat and turn it round, tying it with string. The other way is to make an incision at the back of the neck only, just as if the bird were to be drawn, and to take all the bones out there, turning the skin back from the body, as directed above for the limbs. The slits, whether intentional or accidental (and a beginner will probably have a few of the latter) should be sewn up with fine cotton.

CURIOSITIES OF MISNOMER.—Black lead is not lead at all, but a compound of carbon and a small quantity of iron. Brazilian grass never grew in Brazil, and is not grass; it is nothing but strips of palm-leaf. Burgundy pitch is not pitch, and does not come from Burgundy; the greater part of it is resin and palm-oil. Catgut is made from the entrails of sheep. Cuttle-bone is not bone, but a kind of chalk once inclosed in the fossil remains of extinct species of cuttle fish. German silver was not invented in Germany, and does not contain a particle of silver. Cleopatra's Needle was not erected by the Egyptian Queen, nor in her honor. Pompey's pillar had no historical connection with Pompey in any way. Sealing wax does not contain a particle of wax, but is composed of Venice turpentine, shellac, and cinnabar. The tuberose is no rose, but a species of polyanth. The strawberry is no berry, but only a succulent receptacle. Turkish baths did not originate in Turkey, and are not baths, but heated chambers. Whalebone is not bone, and is said not to possess a single property of bone.—*Providence Journal.*

ANCIENT BRICK BUILDING.—Professor Adler, at the recent opening of the new Technical High School in Berlin, gave an interesting account of the history of brick building in Germany. The Roman method was known more especially at Treves and Cologne. A brick stamp of the year 630 bears the name of Bishop Arbogast of Strasburg. In a great many of the later buildings bricks from older structures were used. From the middle of the tenth century brick appears as a decorative material in architecture, especially in tufa stone buildings on the Lower Rhine. Roman civilization had made but little progress, however, between the Rhine and the Elbe, and the brick manufacture was entirely unknown for centuries, stone and wood only being used. The oldest brick building in Denmark is the cloister at Sorce, on the island of Zealand, (1151 A. D.) Most of the brick building in eastern Germany was introduced by the Dutch during the twelfth century, but the Roman system of working was followed.

EXUDATIONS ON BRICKWORK.—According to the *American Architect*, the simplest and least expensive method for removing saltpeter exudations from brickwork, when the efflorescences are in positions where the sun and wind do not have free access, is to wash it off with diluted hydrochloric or common muriatic acid of commerce. This acid is very inexpensive; 25 cents worth would be sufficient to clean a front of 20 feet wide by 60 feet in hight, if such a front was totally covered with the objectionable exudation. About one-half pound of the acid is used with an ordinary pailful of water, the application being made with a sponge, which can be held in the naked hand or attached to a stick to reach the spots, as may be desired. When the efflorescences have been thus removed, it is perfectly useless, in the present state of knowledge, to attempt to stop a reappearance, for when circumstances are again favorable, the saltpeter exudations will promptly spread themselves over the walls.

JAPANESE PROGRESS.—Not ten years have elapsed since the first paper mill was started in Japan, with the latest appliances of American and European machinery, and now we are told that there are a dozen mills in operation in that country. This illustrates the progressive character of the Japanese people and the intelligence which has been quick to seize upon advance in industrial art. We are told, too, that the Japanese paper makers are well up in their trade and do not need the aid of foremen of foreign birth. The Osaka mill reimbursed the money invested in it in three years, and in 1884 the Oji mill paid a 17 per cent dividend on a capital of $565,000. With all this, the Japanese imports of paper from the United States and Europe are steadily increasing. The example of Japan has incited the Chinese, and it is reported that a paper mill is to be built at Shanghai.

IMPORTANT IF TRUE.—A wonderful piece of news comes from Washington. It is as follows: While looking after the interests of the western water-ways, George L. Wright has had gazetted a patent which is said to contain a bonanza. It almost annihilates the chief expense of producing electric power. Running water does the work, and the invention covers the plan for storing the force until it is needed. A bill is now before the House, with a favorable report from the committee on commerce, providing for a trial of this wonderful idea upon the rivers. When it is stated that Mr. Wright's machinery, placed in the river, will, with only the current for power, generate the electricity to light St. Louis, some idea of its practical utility, as seen in the mind's eye, will be formed. With these machines scattered along the river, worked automatically by the current, the channel may be lighted from St. Paul to New Orleans like the avenue of a city. They can be put on boats, and the light produced without any engine. The machine can run all day by the flow of the water, and be storing up the power for use at night.

NEW USE FOR OLD SHOES.—Even old shoes are valuable. They are cut up in small pieces, and these are put for a couple of days in chloride of sulphur, which makes the leather very hard and brittle. After this is effected, the material is washed in water, dried, ground to powder, and mixed with some substance which makes the particles adhere together, as shellac, good glue, or thick solution of gum. It is then pressed into moulds, and shaped into combs, buttons, knife handles and many other articles.

A CONSIGNMENT OF BUMBLE-BEES.—Probably as curious an article of export as is often carried in an ocean steamer, was lately taken out to New Zealand. It consisted of a consignment of "bumble-bees." At present, clover does not "seed" in that country, though it grows readily, because there are no humble-bees to fertilize the flower. The importer hopes that the bumble-bees will save him $5,000 dollars a year on clover seed.—*Ex.*

GOOD HEALTH.

A Cause of Sudden Deaths.

The sudden death from apoplexy of the Hon. Schuyler Colfax, ex-Vice-President of the United States, at Mankato, Minn., on the morning of January 13th, while apparently in the enjoyment of the best of health, should admonish all of the great danger incurred by exposure to extremes of temperature. It appears that Mr. Colfax walked from one depot in Mankato to another, three-fourths of a mile distant. He faced a bitter wind all the way, and the thermometer was 30° below zero. Reaching his destination, he immediately entered the waiting-room, where, presumably, the temperature was at least 70° above zero, possibly even warmer than that. The vital powers could not withstand a sudden variation of temperature of 100° or more, and Mr. Colfax in a few minutes dropped dead.

A gradual change would have probably produced no harmful results, but an instant change from an atmosphere highly charged with oxygen to one only moderately impregnated with that vitalizing constituent, proved fatal.

Most people have experienced, at one time or another, a faint, suffocating feeling on going suddenly from extreme cold to extreme heat, and have never probably guessed how near they were to a stroke of apoplexy.

The transition from extreme heat to extreme cold is often equally fatal in its effects, though in a different way and not so quickly.

It has been demonstrated that no living room should be kept warmer in winter than a temperature of 70°. Sixty-seven degrees or 68° is probably still better. Most houses are kept much warmer than this, the thermometer often indicating 75°, 80°, and even 85°.

What is the result of this extreme heat?

All the minute pores of the body, to the number, it is estimated, of several millions, expand, open their tiny doors, as it were, and permit the waste of the body to pass out by means of perspiration.

Suddenly subject this body, with its millions of little doors wide open, to a temperature of say 20 or 25 degrees above zero, or even colder, and what is the result? Instantly the millions of pores close up, the perspiration ceases and the waste, a moment before passing out by these wide-open doors all over the body, is compelled to find another outlet. It is thrown back upon itself, as it were, and upon the internal organs. The kidneys are called upon, without a moment's warning, to perform almost superhuman work, and do it partially, but often at the expense of becoming diseased. The waste material that cannot find an outlet through these organs and other channels, clogs the blood, and you find yourself down sick with a cold, and, perhaps, inflammation of the kidneys into the bargain, or possibly that terribly fatal and swift-working malady, pneumonia, may supervene.

Every house should be provided with one or more thermometers, and it should be the business of somebody to see that the temperature never rises much above 68° or 70°.

Families that are careful in this respect will have far less colds, and other ills resulting from colds, than where this simple precaution is neglected.—*Exchange.*

BEAUTY AND ITS PRESERVATION.—Grief, as well as all agitation of the mind, is detrimental to beauty. Too much excitement of the tear ducts dims the eyes, and traces of the working of the passions are left upon the face. Those persons who are happily gifted with an equable temperament grow old much less quickly than those whose dispositions are the reverse. Girls sometimes bit and suck their lips in order to make them red. It is a foolish habit which may injure their shape. Dryness and crackieg of the lips, as well as "fever sores," are usually due to a disordered stomach. Persons liable to such troubles should apply to their lips every night a salve of glycerine mixed with lard, which is the best application known for that purpose. A fever sore begins as a hot, painful lump on the lip, soon changing into a blister. It is both annoying and disfiguring. The sore should never be rubbed or scratched. At the very outset it should be touched with this preparation every few hours: Carbolic acid, ten drops; glycerine, a teaspoonful, attar of roses, two drops. Beauty, it is said, is only skin-deep. Accordingly, she who would be beautiful should pay the utmost attention to the rules above set forth. Beauty is not, however, in reality skin-deep; it is only scarf-skin deep, as deep as the epidermis. Blister a negro and when the epidermis comes away you will find the spot is white. The epidermis contains the coloring matter which distinguishes the negro from the white man, the blood from the brunette. In this brief article the writer has only treated of skin troubles which may affect those who are in health. When affections of the skin spring from constitutional disorders, constitutional remedies must be sought.

THE MEDICAL USE OF EGGS.—For burns and scalds there is nothing more soothing than the white of an egg, which may be poured over the wound. It is softer as varnish for a burn than collodion, and being always on hand can be applied immediately. It is also more cooling than the "sweet oil and cotton" which was formerly supposed to be the surest application to allay the smarting pain. It is the contact with the air which gives the extreme discomfort experienced from ordinary accidents of this kind; and anything which excludes air and prevents inflammation is the best thing to be applied. The egg is also considered one of the very best remedies for dysentery. Beaten up lightly, with or without sugar, and swallowed at a gulp, it lends by its emollient qualities to lessen the inflammation of the stomach and its intestines, and by forming a transient coating for these organs to enable nature to assume her healthful sway over the diseased body. Two, or at most three, eggs per day would be all that would be required in ordinary cases; and since the egg is not merely a medicine, but food as well, the lighter the diet otherwise, and the quieter the patient is kept, the more rapid and certain is the recovery.

HOW TO SOFTEN THE HANDS.—"How am I to whiten and soften my hands?" is a question that is asked by a correspondent. Doubtless one way to do this is to avoid the work which has made your hands rough and dark, but often this work may be done with such care that the hands will not be injured. If one is obliged to sweep her house, to empty the ashes from the grate or stove, and to wash dishes, she cannot expect to keep her hands as white as idle hands are; but if she takes the precaution to put on a pair of gloves or mittens when she sweeps and is doing dusty work, one cause of rough skin will be removed. Then there are preparations which one may use. Powdered borax is excellent to soften the skin. A mixture which is said to be sure cure for undue perspiration of the hands is made of a quarter of an ounce of powdered alum, the white of one egg, and enough bran to make a thick paste. After washing your hands, apply this; let it remain on your hands two or three minutes, and then wipe off with a soft, dry towel. Lukewarm water is better than hot or cold, if the skin is inclined to be tender or chap.

FRECKLES.—The following is a celebrated remedy for freckles and may be compounded at home. Best English mustard powder, a tablespoonful; lemon juice, enough to make a thin paste; oil of almonds, a teaspoonful. Mix them well, and apply in a thick plaster night and morning until the skin smarts; after a few days the scarf skin should loosen and the freckles disappear. After they have gone the surface should be washed several times daily with a solution of borax, and the patient should not venture into the open air for some days.

A NEW REMEDY FOR CANCER is alleged to have been discovered in a Brazilian plant, which those who remember the story of cundurango will wait to see more fully tried before pinning their faith upon it. Some wonderful reports of its efficacy in cancerous tumors have been reported by Brazilian doctors. The remedy has been brought to the knowledge of our State Department by our consul at Pernambuco.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW MILL.—Amador *Dispatch*, Feb. 21: Mr. S. G. Shugert went below last Wednesday morning for the purpose, we understand, of purchasing the necessary machinery for erecting a new 20-stamp quartz mill on the Amador Queen mine. The Lincoln mill at Sutter creek has been temporarily closed down, owing to the scarcity of rock in the mine.

SUTTER CREEK.—Cor. Amador *Ledger*, Feb. 21: The rock now being extracted from the Eureka is being saved from the mill, and the dumps are already nearly full. The mill will probably be started in a few days, and the important question of the paying character of the ore definitely settled. The Lincoln mill and mine closed done last Friday, on account of the exhaustion of the ore in the level. A contract was to have been let last Monday for delivering 62 tons per day from the old Lincoln dump pile to the mill. Twenty stamps of the mill will be kept running on this. It is thought that it will take from two to three months to run through the entire pile. The contract taken by Sutter creek boys some time ago to sink 1,000 feet on a mine across the Consumnes river, in El Dorado county, has been completed. George Liccovich, one of the men, got back last week, and says the rest will be down as soon as they can get their money. When this will be, however, is very uncertain, as everything is in litigation, as a number of contractors who left before much was accomplished, have sued the others for their wages, and until this is settled there will be no final settlement by the company.

MISCELLANEOUS.—A contract was let last Monday by Messrs. Shugert and Morgan, for running 100 feet south on the 150-foot level of the Amador Queen mine at Murphy's Ridge. The contract was awarded to W. Doyle and J. C. McNamara at $3 40 per foot, contractors to furnish candles, powder and fuse. The tunnel is to be 5x6 feet in the clear. The contractors entered upon the work Thursday morning. The contract for re-opening the old shaft of the Gover was not let, all the bids received being considered too high. The undertaking was a difficult and risky one to be tackled on the contract plan, as it is impossible to tell what amount of work is involved in placing the shaft in a serviceable condition.

Inyo.

QUARTZ.—Inyo *Independent*, Feb. 21: It is reported that there was quite an excitement at Bishop Creek, caused by the recent discovery just west of town of a large and rich vein of quartz. Everybody was going to take a look at the new find,

Mono.

THE STANDARD CON.—Bodie *Free Press*, Feb. 19: In a long conversation with manager A. Pettibone, our reporter is pleased to state that the interest in the Standard Con. has not abated in the least. They appear to have unlimited confidence in Mr. Pettibone's experience as a practical miner and have invested him with full power to carry out any plans he may suggest. The low-grade proposition will be solved to the best advantage and then attention will be directed to the practicability of sinking a new working shaft, exploring and testing the lower level, etc. No reduction in wages have been contemplated by the new management, but the curtailing of expenses in the salaries and at the different offices has been general.

Napa.

SILVER MINE.—*Calistogian*, Feb. 20: We visited the Grisby and Johnson Silver Mine in King canyon, about three miles from Calistoga. J. J. Johnson, one of the owners, was present and accompanied the party about the property, and kindly answered the numerous inquiries made. The Grisby & Johnson property embraces three or more claims, in two of which (Easley and Old Discovery) all the work worthy of mention has thus far been done. The Easley claim is the oldest location, and was first taken up in 1876, by W. H. Easley. This claim includes the ground in which Thomas H. Reynolds engaged in work a few years ago, and in which Judge Hartwell also labored and disposed of his then available cash. Their work, however, was done mainly a short distance from the vein that now attracts so much attention on account of its extent and richness, and which was in part first cut in 1881. The course of the Easley vein is a little east of north. It dips to the west, and its inclination is comparatively slight at the present depth of working. Its average width is eleven feet. The Old Discovery claim adjoins the Easley on the east side. The vein of ore found in this ground averages twelve feet in width so far as known, though it has been prospected but little. It has about the same course and dips as the other vein, but is richer. In addition to these it is said that another important vein of ore extends the length of one of these claims, but, if so, it has not yet been found by the owners of the property; though their ground has been fully prospected thus far. In the winter of 1881, the Bounsall brothers commenced work on the left side of the canyon, which is quite narrow there, and ran a tunnel to the west, and into the hill a distance of 100 feet or more, through extremely hard rock. At this distance, and over sixty feet below the surface, they cut the Easley vein, and found plenty of rich ore. It was this discovery that in part settled the question as to whether good silver ore in paying quantities could be found here and away from Mt. St. Helena. Soon after they cut the vein, Gashwiler, of San Francisco, now dead, became interested with them in the claim, and work was continued a few months, when a dispute arose as to the ownership of the ground, and work was suspended. In 1882 Grisby & Johnson commenced work on the claim, where the Bounsalls had drifted from the vein, and continued northward on the vein, finishing when a point 350 feet from the end of the tunnel had been reached. At the north end of this drift another shaft was sunk a distance of 65 feet. In 1877 Mr. Johnson commenced sinking a shaft a short distance to the north of the entrance to the Bounsall tunnel, and on the Old Discovery claim. Work was done in it at different times until resumed in earnest several months ago, when it was sunk through very hard rock to the depth of 168 feet. Through this (the working) shaft, all ore and rock is now raised, a whim being used for the purpose. From the bottom of this shaft a cross-cut 180 feet long was run through extremely hard rock toward the west. The crosscut reached the Old Discovery vein in 45 feet, and the Easley vein was cut 135 feet further on. This crosscut opened up the third level of the mine. Drifting on the Easley vein from the end of the crosscut was continued south 70 feet, when a 65 feet upraise was made to the bottom of the Bounsall winze, making the winze now more than 120 feet deep. Work is now being pushed southward in the vein on the third level, and northward from the point where cut by the crosscut. This drift is now 135 feet long, ore being found the entire length, some of it very low grade and the balance good milling and high grade. The same has been found true in the first and second levels. A great deal of drifting, etc., has been done on this property which is not mentioned here, as it is in another part of the mine, and for the present has very little to do with the work now being done, though all will be of consequence hereafter. Up to this time nearly 1100 feet of drifting and crosscutting has been done under ground on this property, and also 360 feet of shaft; and an immense amount more in contemplation. All work done by the present owners is entirely satisfactory to them, and the further the ore veins are opened up the better the owners are pleased. Aside from the thousands of dollars expended on this property by others, Grisby & Johnson have alone paid out over $23,000. Six hundred tons of high grade ore have been raised to the surface, and very many tons of low grade, all of which will be worked when a mill is erected—probably within a few months. The best ore taken from the drifts during the coming few weeks, will be sent to the new reduction works at Vallejo Junction, to be worked soon as things there are in readiness.

Nevada.

ENCOURAGING REPORT.—*Herald*, Feb. 21: A gentleman of this city has received a letter from a party in San Francisco, in reply to an inquiry regarding the feeling in that city concerning the quartz mines of California and particularly of this county. The writer is in a position where he is daily brought in contact with mining men. He says considerable interest is at present manifested in the quartz mines of this section, and gives it as his opinion that little trouble would be experienced in getting capitalists to take hold of mining property, provided it is in such a shape as to warrant an investment.

MOUNTAINEER.—The Mountaineer mine, situated on the right bank of Deer creek, a short distance below town, continues to produce an abundance of fine gold-bearing quartz. The rock now being taken out carries a large percentage of rich sulphurets, besides some free gold. Fifteen stamps are kept running steadily night and day, and the returns, we understand, are highly satisfactory. The mine is worked by tunnel and the machinery driven by water power. Among miners the Mountaineer is regarded as one of the best locations in the district, both for richness and indications of permanency. At the Nevada City mine, in Woods Ravine, the full complement of 20 stamps are pounding away upon high-grade ore, and eight Frue concentrators are required to catch the sulphurets. This mine is a big gold producer, and although noted for its rich pockets and bunches of specimen quartz, the general quality of the ore is far above average. The company have very complete and well-arranged works. A hurdy-gurdy water wheel runs the machinery. The quartz is fed into the batteries by patent ore feeders, the invention of Geo. A. Church, who is foreman of the mill. The feeder consists of an iron receptacle, which somewhat resembles a barrel cut in two lengthwise, and in which a large auger-shaped piece of iron slowly revolves amongst the rock that falls in from above. As this huge auger, as we will term it, turns around, a certain quantity of rock is discharged into the batteries at regular intervals, there being a break in the thread of the auger so as to prevent constant feeding. The feeder never clogs and will work equally well on all kinds of rock, either hard or soft. The Wyoming keeps up its regular yield and look as well as ever. The mill is running steadily on good rock; and a full force of miners are employed in extracting the ore. The Wyoming is one of the best paying mines hereabouts, and is systematically and economically worked. At the Merrifield mine the mill has not been running for a week or so, owing to a scarcity of rock on the dump. The miners are kept prospecting and new developments are daily expected. The Providence is the old reliable of all the mines in the district and there is but little difference in the monthly outputs. One of the finest and neatest quartz mills in the State is owned by this company. The 40 stamps and 16 Frue concentrators are kept running all the time, there being no trouble in getting plenty of rock. We understand the Charonnat mine, at Canada Hill, is looking well. Splendid rock is being taken out from the lower level. This mine has given handsome returns during the past few years, and we hope it will continue to for many years yet.

BIG PUMP STARTED.—*Tidings*, Feb. 21: The large Lawrence pump, at the North Star, was started last evening, and everything worked to a charm. The pump is throwing a volume of water, and in a short time the company will be able to see the bottom level.

Shasta.

SOUTH FORK-IGO ITEMS.—Cor. Shasta *Courier*, Feb. 21: Messrs. Jutton and Shaffer have put the battery of the Chicago mill in good order and placed a new pattern Frue Vanner in position. They started up the past week and everything is now running well. Could the freight on concentrations be saved, there would be large quantities of low-grade ore worked which we cannot now profitably. Work on the lower tunnel of the South Chicago is being continued, with the expectation of soon reaching the ore chimney had in the tunnel above. Shirland and Henneken are at work in their lower tunnel on the Continental and are getting some ore, although the ledge is still much broken. Messrs. Meek, Hubbard and H. Abbott have just finished a satisfactory run for their Pacific mine. Prospecting and relocation of mines is now the order of the day.

Sierra.

BALD MOUNTAIN.—*Mountain-Messenger*, Feb. 21: The Bald Mountain Co., at Forest City, are employing 56 men. Near 100 ounces of gold was cleaned up from ten carloads of gravel from the incline under the lava flow this week. It costs $4 per carload to bring it out. An ounce and a half nugget was picked up in one of the Extension breasts this week. The Rainbow Co. are still searching for the extension of their ledge. We heard a few days since that the Marguerite pumps were almost ready to begin the work of clearing the lower levels of water. The wire rope power is a complete success. Geo. Parent came up from Pike City, Thursday, and says the Alaska Co. is taking out rich quartz. Jerome York has taken charge of the works in Slug canyon. The work of getting down rock is progressing favorably. The mill is now running night and day. The little rock taken out has been very rich. It is thought that no further difficulty will be experienced in getting all the quartz the mill can crush.

Siskiyou.

PICK AND PAN.—Yreka *Union*, Feb. 21: The weather at present looks rather unfavorable for an early season for the river miners. Johnston's 10-stamp mill at Oro Fino is still idle, but will probably be set in motion next month. Messrs. A. G. McCoy, J. M. Gleaves, Peter Johnson and John Spelman have recorded a quartz ledge in the Salmon district. John Pitz has deeded to H. J. Diggles of Fort Jones one-half interest in a quartz ledge situated in Quartz Valley known as the Big Ledge. M. Slater and Luke Shaw has just recorded the location of 40 acres of placer ground in Quartz Valley. The claim will be known as the Shackelford. Amos F. Jacobson has located 20 acres of placer ground, to be known as the Red Bank mine, in the south fork of Salmon mining district, near Petersburg. Tucker & Co., below the mouth of the east fork of Deadwood, will soon clean up. They have crushed upward of a hundred tons of ore, and expect good returns. Martin Olsen has located on the north fork of Salmon river, Liberty mining district, about 9 miles below Sawyer's Bar, 20 acres of placer ground, to be known as the Swan claim. Mr. Wm. McConnell, owner of one of the most extensive river claims on the Klamath, is anxiously awaiting low water. Last season Mr. McConnell took out upwards of $29,000. R. H. Campbell and a number of gentlemen from Red Bluff have taken up a placer claim to be styled the Cyclone, near the trail from Summerville to Cecilville. The tract comprises 160 acres. Campbell, in his mine in Quartz valley, has been piping since New Year's with a force of 12 men. Every indication points to a more profitable season than last, when the cleanup amounted to over $40,000. Wright & Fletcher at Oro Fino are running their giants, full time, with a large force of laborers. Their claim is recognized as one of the best and most extensive in the county, and it has never failed to yield large returns. John S. Lowden and Geo. W. Lowden have purchased the John Madden claim, situated 2 miles below Humbug on the left bank of the Klamath river, together with the ditches and water rights. The claim comprises 27 acres. George C. Spooner, Mr. W. Spooner, A. W. Morris, Jno. Parker, Alex. Parker, Jr., and Louis Davis have located 160 acres of placer mining ground in the south fork of Salmon district. The claim is to be known as the Capitol. Messrs. J. M. Single, Fred Smith, A. M. Johnson, J. W. McBride, Dr. C. W. Nutting, Charles Kist and C. H. French, all of Etna, have taken up 160 acres of placer ground in south fork of Salmon district to be known as the Blaine mine. J. S. Cameron, A. J. Loomis, T. R. Ryan, W. B. Calhoon, George Taylor, D. W. Frank, H. C. Hughes and George Smith have located a claim of 160 acres near the trail leading from Petersburg to Cecilville, to be known as the Diamond. Active operations have commenced in the hydraulic claim of Smith, Campbell & Spooner at Summerville, and the owners look forward to a profitable cleanup. The 4-mile ditch, which is to tap the Little North Fork of Salmon, is being rapidly constructed. Lieutenant-Governor Daggart and family will take up their residence at Black Bear immediately after the Legislature adjourns. Work on the mine will then commence, with a large force. We believe it is the intention of the Governor to give work to a number of men who have families, which will make quite a settlement at Black Bear. The first of March, A. M. Johnson will start 8 or 10 men at work on the Johnson ledge at Oro Fino, which has yielded a handsome fortune for its owner since its discovery. Mr. Johnson has had 2 miners prospecting the ledge all winter, and in working the lead this season will follow a course planned from observations made by the prospectors. The rock yields $40 to the ton. Carroll Brothers, in Quartz valley, are taking ore from their mine, and are much encouraged with the development made thus far. Their tunnel extends 300 ft, and the vein is confined within well-defined walls. The rock crushed last season averaged $33 to the ton. They now have about 20 tons in the dump and 4 men are engaged in mining. They have 3 arastras which will be started as soon as the weather moderates.

Yuba.

OLD LEDGE.—North San Juan *Times*, Feb. 21: John Clay, of Garden City, Yuba county, made us a call on Monday last. He reports having found a quartz ledge at Dad's gulch, in the neighborhood of the Slate Range House, which prospects well. It is an old ledge, worked 20 years ago, which then paid immensely, but for want of machinery was abandoned by its owners.

NEVADA.

Washoe District.

GOULD AND CURRY.—Explorations are being made from the new station on the 1000 level of the Bonner shaft in ground never before prospected.

OPHIR.—They are working the north lateral drift on the 500 level and will continue through the Mexican and Union ground.

YELLOW JACKET.—They are still working on the old upper levels and extracting a large quantity of low-grade ore.

CROWN POINT.—The usual amount of low-grade ore is being taken out and shipped to the mills.

CHOLLAR.—On the 3000 level they are beginning to drift south and are in good ground.

SAVAGE.—On the upper tunnel they are cutting good quartz.

HALE AND NORCROSS.—*Enterprise*, Feb. 21: The west crosscut on the 2900 level is out 40 ft in good looking quartz. Crosscut No. 2 has not yet struck the vein, but finds feeders assaying $14.

Central District.

AT WORK.—*Silver State*, Feb. 21: S. W. Hammand, of Central district, is in town. He says everybody is at work down that way. The Locomotive mine, which was leased by Frank Clark to Gould & O'Donnel of Mill City is looking better than ever before. The mine has been systematically opened, and the lessees have commenced stoping. They have hauled 100 tons of ore to the mill, and the mine is now in condition to furnish all the ore the mill can reduce.

Columbus District.

MOUNT DIABLO.—*True Fissure*, Feb. 21: The west drift on the sixth level is now in 137 ft, and the south crosscut from this drift is in 27 ft. The raise from the west drift on the fifth level has been stopped and a drift started from the raise to correct with the west intermediate from winze No. 1. There remain 6 ft to drive, and when the connection is made a stope will be started, and should yield a good deal of high-grade ore as the outlook is very favorable. The stope near winze No. 1 on the fifth level, shows some $45 ore. The west drift on the fourth level has connected with winze No. 7, and work has been started on a little $80 ore found in this drift. The winze from the intermediate between the third and fourth levels and east of shaft, has connected with the fourth level and a stope has been started on a little $100 ore. The stope west of the shaft, between the second and third levels and west of the shaft, is turning out a good quantity of from $30 to $60 ore from a ledge 2 ft in width. The east drift on the second level is giving some $100 ore from a small ledge. The remaining parts of the mine are looking well and yielding considerable ore. A bullion shipment amounting to $6,824.76 was made on the 15th instant.

Cortez District.

THE GARRISON MINE.—Eureka *Sentinel*, Feb. 22: One of the most valuable mining properties in Cortez district, and a property that is scarcely ever heard of by the outside world, is the Garrison mine, 10 miles south of Bullion Hill. It is owned by S. Wenban, and the ore being extracted from it keeps a 10-stamp mill, owned by the same gentleman, in constant operation. Sometimes when the ore extracted is unusually rich good sized shipments of it are made to Salt Lake City for reduction. Some 70 men are employed in the mine and mill, and the shipments of bullion will exceed a monthly average of $40,000.

Eureka District.

THE EUREKA CON.—*Sentinel*, Feb. 21: The improvements going on at the Eureka Con. works have assumed tangible form, and the work of mixing ores is now in active progress. The mixing floor, which is 10x22 ft, has already on it mixed ores to the depth of 15 inches, and enough ore and flux is in a large adjoining room to make in all at least 120 tons. When this plant is complete several trapdoors in the floor will be opened and the mixture will be allowed to drop into a large bin the entire length of the structure. When the furnace is completed and ready to receive ore for smelting, self-dumping cars will be filled from doors in the bottom of the bin, and they will then be drawn up over a cable tramway to the floor of the furnace building. The mixing floor is sufficiently capacious to accomodate at least 500 tons of ore. Every thing about the works will be so arranged that no shoveling of ore will be required from the time it is mixed until it is fed to the furnace, and it is the opinion of Superintendent Robbins that the company will be able to handle ores much cheaper than has ever been known in this section when all their improvements are completed. We might add that all the present improvements now being made are such that they can be added to as the requirements of the company may in time demand.

Reese River District.

THE MANHATTAN COMPANY.—Austin *Reveille*, Feb. 18: The Manhattan Company is putting up machinery on the old Union shaft just above the Naiad Queen works. There is a shaft 200 ft deep there which has been idle for some years. This will be cleaned out and repaired and sunk deeper. Powerful machinery is to be erected upon these works and the business of prospecting this new country will be energetically pushed. Ever since the famous Whitlach ledge was lost that particular section has been looked upon with much interest and now the company will prospect for it or any other ledge which may be shown up. They are now busy erecting the machinery and building over the Union, and already the frame work can be seen looming up just to the left and a little above the old concentrator.

Safford District.

QUIET.—Cor. Eureka *Sentinel*, Feb. 20: The mining news in this quarter is rather meager. No work is being done, except at the San Francisco tunnel, which is being run on a contract by the Shields Brothers. I am taking out and shipping ore to Salt Lake from the Onondago. I am making an effort to place the mine again on velvet, which, with careful, economical management, I hope to accomplish within the next 90 days. Am doing no dead work on the mine at present.

Tuscarora District.

INDEPENDENCE.—*Times-Review*, Feb. 21: East crosscut, 400-ft level, has been extended 19 ft, total length, 43 ft. South drift, same level, advanced 19 ft; total length, 1,048 ft.

NORTH BELLE ISLE.—North drift, 150-ft level, has been extended 55 ft., Progress for the past week, 18 ft.

BELLE ISLE.—During the past week the drift north on the 70-ft level has been connected with the upraise from the 150-ft level. Work will be resumed at other points in the mine during the coming week.

NAVAJO.—The 650-ft level has been drained, and the station pump is being set. Work will be resumed on this level in a day or two. No. 1 winze on the east lateral vein, 350 ft level, has been sunk 24 ft. The bottom of the winze shows its full width in vein matter, carrying some low grade ore.

Union District.

IMPROVING.—Cor. Eureka *Sentinel*, Feb. 21: In Union district it is expected the first of May, if the season is propitious, will witness the commencement

of a mining boom, which, once started, must necessarily be a success. If the best indications do not fail the owners of mining property will have a furnace erected in their district, or commenced by that time. All signs have been known to fail, especially in mining matters, and as a hucolic maiden once remarked: "It is not safe to count your chickens before they are hatched." This observation may not be amiss in this case, but as some valuable mining properties were bargained for and sold, conditionally, with a stipulation that a furnace should be erected, it seems safe to assume that something will be done there this spring. At present but few men are working either here or in Union. On the Hill the Silver Reef mine is turning on some very fine ore, but in small quantities. From the Swallow also, some ore of a fair grade is being extracted. The output of the latter mine will probably be shipped to the Palisade furnace after that institution discharges its financial obligations, which, no doubt, will be done within the next few months, or, as interested parties say, "by the first of June or before." Several locations of considerable promise have been made in Uninn recently in anticipation of a furnace in the near future. The snow is very deep in portions of the district, and but little progress can be made in developing new properties until spring opens when it is to be hoped, the most sanguine expectations of the owners will be fully realized.

ARIZONA.

LUCK SURE.—Tombstone *Epitaph*, Feb. 20: Chloriders have been at work on the lower level of the lower ledge of this mine for some time, and have within the last few days opened out a showing of superior grade of hard carbonate with formation crevices from ledge indicative of opening into a chimney. Now on dump about eight tons of high-grade ore. To connect the upper ledge with the 300 level of the lower will require a cross-cut of about 150 feet, a contract for driving which will probably be let in the near future.

T. M. & M. CO.—Smelter and both mills at Millville, under the management of mill Supt. Cheney, are running constantly on ore from West Side and Stonewall principally. There has been a rumor for several days that in the lower workings of the West Side and from the ledge a large chamber of high-grade ore has been opened. In the absence of Supt. Cheney we declined to press the question. At the reduction works of this company about 95 men are now employed.

OLD GUARD.—The new shaft is now down 42 feet with north drift in 38 feet and south drift 30 feet. South drift face shows two feet of fine pay ore while the north has a pay streak width of five feet that will average 50 ounces. Four and a half tons of $200 and upwards of six tons of $100 ore are sacked for another shipment to Socorro, and on the dump there is 150 tons of 30 ounce and 40 tons of 30 ounce rock.

HEAD CENTER.—Thirty-two tons a day is the shipment to the mill, which therefrom is shipping bullion at the rate of $1,000 per day. The main shaft is down 200 feet, with drifting on ore progressing on the 100 and 200-foot, on which latter there is now upwards of 500 feet of work. Fifty-six men are employed by Supt. Batterman in the mine and 16 at the mill.

MAMIE.—Capt. Taylor evidently intends business on this property under his lease, from the preparation now making to put the mine in proper shape for work, which will require a fortnight yet, as the property was left in a very bad condition for economic handling. Though nothing is being attempted as yet except preparatory work, yet ore was coming to the surface yesterday.

CONTENTION.—Supt. White is expected to arrive shortly, but, though merely conjecture, it is not likely that much will be done prior to the completion of the Grand Central pumps. The 47 feet of 24 ounce average ore below the 600 level will not spoil by waiting, and the mill is running constantly on the immense tailings dump that has accumulated there.

JUNIETTA.—Superintendent being absent from mine, and foreman close-mouthed, no information gleaned, further than could be seen on the surface. Some eight or ten men are, we believe, employed in the mine, and on the dump yesterday there was over 200 sacks, representing about 15 tons, of a very superior grade of ore awaiting shipment by rail for reduction.

EMERALD.—Shipments to the mill are at the rate of 800 tons a month and have been for some time past. The two shafts, 250 feet apart, are connected on the ledge both on the 150 and 250-foot levels, while the north drift is down 350 feet and sinking progressing. The north and south drifts on the 350 level having a combined length of 250 feet.

GRAND CENTRAL.—From foreman Leach it is learned that the pumps will be ready to commence sinking about the first of June. All the ore shipped now to the mills is taken from above the 500-foot level and mostly from the 400 level and above.

STONEWALL.—A daily shipment is made to the T. M. & M. Millville smelter of manganese ore. Winzes are now down from the 340-foot level 70 feet in pay ore. About a dozen men are employed in the mine.

BONANZA KING.—East of Ajax hill and probably on Emerald lead, shaft now down nearly 60 feet and ast shot yesterday indicates near approach of ore. Walls from within 20 feet of surface.

CONTACT.—Whim just finished and will start this morning over new shaft 50 leet deep and about 300 feet from the old main shaft or ledge, showing a good healthy prospect.

STATE OF MAINE.—Working is now down over 500 feet, work going on under lease with continued output of limited quantity of exceedingly high-grade ore.

LUCKY TIMES EXPECTED.—Prescott *Courier*, Feb. 21: The *Courier*, in looking to the mountains, sees that snow is going and that the season for active work in the mines will soon be here. Signs are that it will be an active, prosperous season, too, which is just what our people want. Our reasons for expecting lively times are as follows: In the first place our miners own good properties, such as the chloride deposits of Humbug district; the rich veins of Bradshaw, Peck, Turkey creek, Big Bug, Hassayampa, Walker, Santa Maria and other districts, the fine copper properties of the United Verde company, and others. The Howell reduction works will undoubtedly be run. Mr. Chase is running one mill; the Conger mill is at work; the Humbug district mill, now idle, will soon be started up; the United Verde company's smelters will soon be fired up, and there are many other plants to be heard from. In addition, the shipment of ores will be continued, so there is not, in our opinion, cause for anything but rejoicing on the part of people who, of late, have been in a despondent mood.

CHERRY CREEK.—Cor. Prescott *Courier*, Feb. 21: This camp is the only one that has worked its mines continuously since they were taken hold of, and too much praise cannot be given the company who have worked their mine and constructed the most fully equipped and complete gold mill in northern Arizona. This mill is run by water power. I am speaking of the Conger Mill and Mining Company. The ditch is two miles long and six feet wide, and some of the cuts are 12 to 18 feet deep. The mill is a 10-stamp gold mill, from the firm of Frazier and Chalmer, of Chicago, and was built under the direction of Mr. Ed. Morey. They have two Frue-Vanning concentrators and intend to put two more in place. It takes but two men to run the mill. It is run by an 80-horse power turbine wheel and they can mill ore so much cheaper than any other mill in Arizona, as a great deal of expense has been done away with. Mr. Ed. Morey has charge of the mill and is assisted by Fred Bush, a son of the general superintendent and manager. They have 14 men at work on the company's property and six men around the mill. I found ont that the mill saves all that is in the ore and I prophesy that they will reap a fortune by having pluck and energy to further prosecute this work after so many disastrous failures on the part of the former management.

NEW DISTRICT.—Yuma *Sentinel*, Feb. 21: D. M. Field, of Tacna Station, came into town last Sunday. He reports the organization of a new mining district in Cabeza Prieta Range, near Tule Wells. The district is six miles square and is known as the Cabeza Prieta Mining district. The celebrated gold mine known as the "Chloride," recently taken up by D. M. Field and George Hurley, is located about the center of the district, and is said to be the richest strike ever made in this country anywhere. This location was an old prospect discovered about 15 years ago by a Mexican, and an assay of the ore then made gave a return of $900 to the ton in gold. J. M. Redondo, who intended to go on with the mine and work it for a certain share with the discoverer, died soon after completing arrangements. The discoverer, who having become discouraged at the death of Redondo, took sick, and he too, soon died. All this happened some 15 years ago and during all this period of time the mine has been idle, as no one knew of its exact locality. Several persons had been looking for it for weeks and months but without success. Finally the wheel of fortune turned in favor of D. M. Field and George Hurley who became the lucky finders and who feel very much elated over their splendid luck. They say they have the biggest and best mine in the United States, or perhaps, the world. This great bonanza is about 75 miles southeasterly from the Tule Wells, in this county. It is about 35 miles from Tacna, the railroad station. The ledge is 40 feet wide, and the very surface rock assays $90 to the ton. The ore is of a peculiar texture and can be worked with ordinary picks and shovels, and without blasting.

PLACER MINING.—Arizona *Silver Belt*, Feb 21: On Wednesday we visited the placer digging, on Pinal creek, near the Anderson ranch, and were surprised to find that Messrs. Chaffin and Phillips, owners of the claims, had completed their ditch, and had begun sluicing. Taking out a ditch 6,000 ft long is no small task, and the last 150 ft necessitated a 6-foot cut through a cement formation, which was very difficult to work, and required some blasting. They have a good flow of water through their sluice box, probably 40 inches. The box is 86 ft in length, 14 of which is flume. Two kinds of riffles are used—the Flat, which consists of a flat board perforated with half-inch holes, into which the gold is precipitated, and the Hungarian riffle, which consists of cross pieces several inches in depth, which are placed parallel to each other in the bottom of the box, like the rungs of a ladder. Work was commenced at the mouth of the gulch where the ground had previously been partially worked over, so that great results are not expected for a week or more. However, the dirt samples fairly, some showing 10 to 15 colors to the pan. In company with Mr. Chaffin we went up the gulch half a mile, and saw several pans of dirt taken from different places, washed out; one contained 9 colors, another 12, and still another 27. The gold is comparatively coarse, the largest pieces we saw being about the size of a pin head. They hope to have a sufficient head of water for two months yet.

COLORADO.

CLEAR CREEK MINES.—Colorado *Miner*, Feb. 12: The Ætna lode, situated on Griffith mountain, has joined the ranks of our prominent producers. Five different parties of lessees are working claims, and all are in good mineral. In the breast of the east drift of the Victoria tunnel level, on the Mendota lode, the lessees have exposed a vein of solid ore about two and one-half feet in thickness. Wm. Shavallin & Co., lessees on the third level of the Bismarck lode, have at this writing a vein of solid ore, about four inches in width, of a very good grade.

IDAHO.

TUNNEL.—Idaho *Avalanche*, Feb. 21: We understand that a prominent mining man, who has followed that occupation for a number of years is going to organize a company to run a tunnel into, and possibly through Florida mountain. The place of beginning will be above Lincoln mill. The tunnel will come out on the other side of Jacobs' gulch. The scheme is a good one if it could be put through. There are many ledges in Florida mountain that have never shown any croppings, while there are others of good size that have been quite rich on the surface. The formation is good working ground, and rapid progress could be made. The tunnel will strike the ledges about 1,400 feet deep, and will afford an excellent drainage for the numerous ledges that it will be sure to cut. Before the tunnel reaches half way to Jacobs' gulch, it will have cut ledges enough to pay all the expenses of running the tunnel. Let the good work be prosecuted, and old Florida, with gold from its base to its summit, will show up the best mining property in the Territory.

ELLENSBURG.—Cœur d'Alene *Sun*, Feb. 18: A town has been laid out on East Eagle creek, at the mouth of Cypress gulch, called Ellensburg, after the Christian name of a daughter of one of the locators. The town is 11 miles from Eagle City. The names of those interested in the townsite are James Myers, Josh Collins, James Taylor, J. Huey, R. Dunlay, John Connelly, Joseph Skillington and Thomas Skiffington. The town is laid out on a sunny bar up and down Eagle creek, with eight blocks, divided into lots of 50 feet front on Main street by 150 feet in depth. The placer mines are situated in the immediate vicinity and Tributary gulch comes into Eagle creek a mile below town. The locators of the place believe the outlook of the diggings justifies the building of a town, as the entire region for a circuit of several miles prospects well.

MONTANA.

LITTLE PIPESTONE.—Cor. Butte *Miner*, Feb. 21: The district is situated about 18 miles from Butte City on the Little Pipestone, and is one of Montana's garden spots. No high inaccessible rocky ranges, but accessible at all times, winter or summer, to all parts of the district, which makes it more favorable for the pioneer prospector. I have visited the Princess lode, owned by McBride, Covert & Co. The shaft is the deepest, so far, in the district—212 feet on the incline, with a fine body of ore in sight all the way down. Levels have been run 50 feet each way from the shaft at 100 feet. They show fine bodies of ore of a high grade, gold and silver. The assays run as high as $350 in gold and 250 ounces in silver. There are 200 tons of ore in the dump, aside from what has been milled. Since my visit, I am informed, the company have made a sale of the property. I visited other properties owned by this company, in the immediate vicinity, and found them all looking well. Shafts sunk from 10 to 40 feet deep on a vein from two to four feet between walls, with fine bodies of quartz, bearing mineral which assays from 50 to 800 ounces. East of the Princess I found our friend, Blodgett, sorting ore. He is working four men, down about 40 feet, has a fine chute of ore, and a new shaft and whim house 24x40 feet. Everything about this mine indicates prosperity, and shows that the owner is there to stay.

About three-quarters of a mile west, on Reeder creek, lays the Honiker mine. The shaft is down 80 feet, and three men are working with whim. The ledge matter is mixed with a little quartz all the way. The owners are sinking a shaft 100 feet, and will cross-cut for the walls. South of this location, about three-fourths of a mile, is the Ajax lode, owned by Burton, Wallace & Co. They have been working a crew of men all the fall and winter prospecting their property. They have sunk a perpendicular shaft 85 feet and not tapping the lead, run a cross cut west 20 feet before finding the foot wall. They found the ledge 7 feet wide between walls with 3 feet solid quartz, which sampled 260 ounces. This company have shipped a number of tons of milling ore. They intend to put up the necessary buildings and machinery, put on a force of men and crowd development. South, on this lode is an extension owned by W. P. Emery and W. C. Lee, called the Continental. The shaft is about 30 feet deep on the incline with 6½ feet of ore between walls. The breast shows a fine ore body. South, and east one-half mile is the "Don't Care" mountain. Emery & Lee have a fine lode called the "Don't Care." They have commenced running a tunnel and are in 80 feet, and are taking out some ore all the while, but do not expect to strike the main ore chute found at the discovery shaft under 75 feet further.

The Alta mine No. 1, owned by Standard, Wallace & Co., is as fine a mine as any one would wish to look at, and is situated on the banks of the Little Pipestone. The workmen are 120 feet deep on the incline, at the water level, where they have stopped sinking. They have 2 feet and 9 inches of ore, which samples 320 ounces and a large amount of pay rock in sight. I was told the company refused $30,000 in cash for their mine last summer. The Christian lode, owned by D. Morrison & Co., has 2 men at work. A whim and shaft house are up and the shaft is 85 feet deep; water level has been reached. Arctic Lode, owned by Pankey, Lee & Co., is on the north branch of the Little Pipestone; two men are at work cross-cutting the vein to find the walls. They have run south 26 feet in ledge matter from bottom of shaft, without finding them. The Chiselway lode, Clark & Co., is a gold lead, free milling. Lowest sample assay from the dump $25 in gold; the highest sample assay from the dump, $85 in gold, nine ounces in silver. This shaft is 50 feet deep, with fine walls and every indication of permanency on the surface. They have about 20 or 25 tons of pay rock on the dump and all from the shaft. A contract has been let to sink a shaft 50 feet deep and run levels each way from the bottom. The major portion of the work mentioned above was done the past fall and present winter. A little prospecting was done a year ago.

NEW MEXICO.

IDLE MILL.—Lake Valley *Herald*, Feb. 20: The mill remains idle, awaiting the discovery of some plan whereby a sufficient quantity of the ore can be saved to pay for milling. So far experiments have resulted in saving only about 50 per cent. The question of turning it into a smelter has been discussed, in view of the fact that no satisfactory arrangement can be made whereby they can control the Billing smelter at Socorro. The president and board of directors are expected out in the near future, and some definite action will be taken.

BONITA BULLION.—Cor. Rio Grande *Republican*, Feb. 21: Herman Beck has gone East to again try his luck with the tight-fisted money holders, and says he will not come back without machinery for the reduction of Bonita ores. Work still goes on in the Christmas tunnel, with a good prospect of soon unearthing a fine body of high grade ore. The ore looks well at present, and presents a flattering and encouraging future for the owners. The contract on the new shaft of the Chinaman is completed. The shaft is now 50 feet in depth, and exposes argentiferous galena from two and a half to three and a half feet wide the entire depth. The company will resume work on the tunnel, and push it till the lead is cut. Parsons and Halsted are working the old Bill Nye claim, now known as the Silver Queen; they will put the shaft to a depth of 100 ft. The assessment was done by starting a tunnel in the gulch east of the old shaft on the lead, and exposed a streak two feet wide of argentiferous galena ore, with small streaks coming in. O. P. Burt and M. Calhoun, of the firm of Burt, Reynolds & Co., are here, pushing the work on the Rosa mine. The water wheel is ready to put up; the creek is dammed, the ditch is completed, and a rick of ore of 100 tons is nearly ready to set on fire to roast for smelting. Mr. Goodwin arrived to-day, and will proceed at once to erect a blast furnace. Most of the material for the completion of the work is in White Oaks, and will be here this week. The mine improves with every blast, and is fully 10 ft wide at the head of the 90-foot tunnel, and the entire gangue is well impregnated with the precious metals. The management propose to start a new tunnel 35 to 40 ft below the present, and they will put one shift on it this week.

OREGON.

PLACER AND QUARTZ.—Jacksonville *Times*, Feb. 21: Considerable prospecting is going on in southern Oregon at present. There was some rain this week, but not enough to do the miners much good. Considerable mining is being done on Rich gulch, Jackson creek and Farmer's flat. Many of the miners are at work and considerable gold dust will be taken out this season. Dean Bros. of Willow Springs precinct are doing considerable work in their placer diggings at Willow Springs precinct. S. Dysert of Leland precinct is taking big pay out of his placer diggings. Other miners in that district are also doing well. J. Roten of Willow Springs precinct showed us some fine specimens of quartz, which he had taken out of his mine last week. B. F. Pierce, C. C. Ragsdale and others have located a quartz ledge in the vicinity of Gold Hill, which promises finely. Some excellent rock has already been secured and work will be vigorously prosecuted before long. Geo. H. Chick of Portland is now in San Francisco to buy machinery for his company's reduction works at the Metropolis. When he returns he will in all probability visit the Schumpf and other ledges in this section. S. Bailey and F. Cimborsky, who took the contract for digging a shaft 50 feet deep on the Enterprise Co.'s mine in this place, gave up the job after going down 10 feet, as they found the rock to hard to make their contract profitable. The work will nevertheless be continued.

UTAH.

REVIEW.—Salt Lake *Tribune*, Feb. 20: The week has been one of storm and casuality, the chief of which, and the worst that has occurred in many years, being the great disaster at Alta, that occurred on Friday evening last, in which 28 persons were engulfed and 13 killed. The shipments of bullion and ore from this city for the week ending February 14th, inclusive, were as follows: Twenty-two cars ore 611,286 pounds; nineteen cars bullion 433,629 pounds Total, forty-one cars, 1,044,915 pounds. The receipts of the metals for the week have been very light. Daily reports give these figures in aggregate to the 18th, inclusive: Bullion, $49,503.50; ore, $15,193.79; total, $64,697.29. For the week previous the receipts were $75,799.55 of bullion and $12,143.92 of ore. There are no exports from the Horn Silver, and nothing doing at the mine in the way of getting out ore since the cave heretofore reported. Preparations are making to get in from the new shaft, as it is probable no further work can be done in the old opening. The Ontario shipped 20 bars of bullion during the week, assaying $14,743. Total of the year to date, $212,608.87. The Christy, of Silver Reef, sent up 3 bars of silver during the week, $4,700, and the Stormont 2 bars, $3,352, a total of $8,052 from the silver sandstones. The product of the Germania smelter for the week was 10 cars of bullion, $20,428.50. Utah ores were received as follows: From the Crescent, to the value of $7,500; from Eureka, $2,800; a total of $10,300.

HORN SILVER.—Southern Utah *Times*, Feb. 21: The discharge of over one hundred men from the Horn Silver mine, is having a most depressing effect upon the business of the camp. In fact, the merchants feel as though it were the straw that will everlastingly break the business back of Frisco. In our opinion the break is a serious one—that is, it will be many months before the present Horn Silver management will have on its pay roll as many names as incumbered it on the tenth of this month. Those who have held on so long, hoping against hope, are justified in feeling that though unsatisfactory as has been the past, it was as sunlight compared to the darkness with which the immediate future is enveloped. The mine is in such a condition since the recent cave, that not to exceed a score of men can be employed to advantage for some time to come. As a man of large mining experience said the other day, "Work on the Horn Silver mine, in the near future, will amount to no more than the opening up of a prospect." This is the situation that presents itself to the inhabitants of Frisco, in this, the second month of the year 1885. The present unfavorable state of affairs, is, as we have indicated, largely attributable to the condition of this mine. It is possible that the Horn will eventually bear an output of ore commensurate with the past, both in quantity and quality, for an indefinite period. The trouble is, that the recent caves and continued settling and working of the ground have rendered the taking out of ore impracticable, if not impossible, for a long time. But time works many changes for weal or woe. Let us hope, at least, that ere many months, the Horn Silver will again be in full blast and working a full complement of men. Of other mining enterprises in this vicinity we are glad to be able to speak more hopefully. The time is near when the hum of active mining will be heard in Copper Gulch. The Comet Company has been industriously, and, we are happy to state, successfully engaged in perfecting arrangements at their headquarters in Paris, whereby ample capital has been raised with which to open up their property. The uncovering of a paying mine at Copper Gulch, would give an impetus to the mining industry of this district not yet dreamed of. And if reports of experts and experienced miners are in anyway reliable, there is little doubt but that the Comet, by intelligent development, will soon prove a veritable bonanza. The Rattler mine, in the Carbonate Camp, continues and is likely to continue to employ its full complement of men, as Superintendent Davis is highly elated over recent developments. The outlook for Star District is being materially brightened by the construction of reduction works at Milford. Very favorable reports also come in from the other neighboring districts, so the future may not be as black as it is painted.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we offer the following advantages to all new subscribers who pay one year in advance, or present subscribers who will pay their subscriptions up to a date fully one year in advance of the present time. We will furnish the following articles (while this notice continues), at the reduced rates named, viz.:

	REGULAR PRICE.
1.—The Agricultural Features of California, by Prof. Hilgard, 138 large pages, bound in stiff cloth.....Postpaid for 25 cts.	$1.00
2.—World's Cyclopedia, 794 pages, with 1,200 illustrations, worth $1.75 ... Postpaid for 50 cts.	
3.—Patent Binder (cloth cover) with name of this paper in gilt .....Postpaid for 50 cts.	1.00
4—Niles' Stock and Poultry Book, pamphlet, 120 pages.....Postpaid for 25 cts.	.50
5.—Kendall's Treatise on the Horse and Diseases.....Postpaid for 5 cts.	.25
6.—To NEW Subscribers, 12 select back Nos. of the RURAL PRESS.....Free	.75
7.—Any of Harper's first-class periodicals, 15 per cent less than regular rates.	
8.—Frank Leslie's and most other U. S. periodicals, 15 per cent discount from regular rates.	
9.—Pacific Coast and Eastern Dailies, Books and Periodicals, *except special publications*, we can usually give 10 to 15 per cent. less than advertised retail rates.	
10.—Picturesque Arizona, 880 pages, in cloth and gilt.....Postpaid for 25 cts.	1.25
11.—Californian, 100 pages, Magazine, 1880 to 1882 (3 Vols.) single Nos...Postpaid for 5 cts.	.35
Per volume, unbound, 6 Vos., Postpaid for 20 cts.	2.00
Per volume, bound, cloth back and stiff paper sides.....Postpaid for 40 cts.	2.50
12.—Flower and Garden Seeds as per list previously published, or which list we will send on application .....Postpaid for 10 cts.	1.00
13—Picturesque California Homes (40 building plans and estimates)....Postpaid for $1	3.50
14.—Dewey's Patent Newspaper File Holder (18 to 36 inch) ..... 25 cts.	.50
15.—Catalogue of European Vines..... 10 cts.	.25

NOTE.—The cash must accompany all orders. If too much is sent for any article or publication, the balance will be returned immediately. Address this office, No. 252 Market St., S. F.

Send for any further information desired.

Readers will please inform their new neighbors and others concerning our paper and these offerings. On application, sample copies of this paper will be mailed free to the address of any persons thought likely to subscribe.

Mining Share Market.

While the stock market has remained steady there has been no special interest manifested outside that ceatering in Hale & Norcross. It is thought there is a prospect of striking something on the 2900 level of this mine. At the office of the Hale & Norcross the reports of the officials are of favorable character. West crosscut No. 1 on the 2900 level is out 40 feet in quartz. Some of the samples assay as high as $70. Crosscut No. 2, 100 feet north, is not yet in vein, but feeders have been cut, assaying $14. On the 3000 level they are about ready to begin drifting.

The managers of the middle mines are in earnest, and if there is anything in the mines it will be shown up. Nearly every one on the Comstock is waiting anxiously for the result of the explorations now being carried on, and it will gladden the hearts of all if a rich body of ore is found.

At the north end mines everything is going on as usual, there being no change in them of any importance, and the same may be said of the Gold Hill mines.

Bullion Shipments.

King (Calico) February 22, $4,217; Alhambra Mill, 22, $12,063; Barber's Mill, 22, $4,600; Vienna, 17, $43,780; Christy, 17, $1,600; Ontario, 17, $14,743; Germania, 18, $9,548; Wood River ore, 18, $2,723; Stormont, 20, $2,100; Ontario, 20, $15,963; Eureka ore, 21, $2,490; Mayflower, 21, $1,710; Wood River ore, 22, $938; Christy, 28, $1,600; Vienna, 22, $7,640.

The banks of Salt Lake city report the receipt for the week ending February 18th, inclusive, of $15,193.79 in ore, and $49,503.50 in bullion; a total of $64,697.29.

New Incorporation.

KEYES, M. Co. Feb. 24.—Location, California. Capital stock, $410,000. Directors, Geo. T. Marye, Jr., Frederick Getchell, Alfred Wheeler, M. J. Sullivan and P. T. Keyes.

ROCKY PEAK, M. Co. Feb. 24.—Location, Sierra county, Cal. Principal place of business, Brandy City. Directors, James Arnott, Philip Fendingham, Peter Mondada, George S. Cooley, A. D. Cutts; capital stock, $48,000 divided into 24,000 shares.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its colnmns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its valne more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Partner Wanted in a Patent.

I have invented a valuable patent, which has been allowed in the U. S., and want to secure partners to take out patents in foreign countries on reasonable terms. Write to or call on J. PETTINGER, International Hotel San Fraacisco, Cal.

MINING SHAREHOLDERS' DIRECTORY.

COMPILRA EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

HEALD'S BUSINESS COLLEGE, 24 Post St. S. F. Send for Circular.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING FEBRUARY 17, 1885.

312,326.—FRUIT PICKER—Brown & Alcorn, Los Angeles, Cal.

312,435.—GAS MIXTURE FOR INHALERS—L. M. Davis, Walla Walla, W. T.

312,262.—DEVICE FOR RAISING AND LOWERING WINDOWS—Eitel & Hunt, S. F.

312,515.—ROASTED COFFEE BERRIES—A. Schilling, S. F.

312,516.—ROASTED COFFEE BERRIES—A. Schilling, S. F.

312,517.—REIN HOLDER—C. Schoeb, Truckee, Cal.

312,396.—ARTIFICIAL LEG CORD—Menzo Spring, S. F.

312,406.—HOSE PATCH—Geo. W. Towle, Jr., San Rafael, Cal.

11,953.—TRADE MARK—Truman, Isham & Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RULE-GAUGE.—Jonathan W. Hunt and John Bressler, Crescent City, Del Norte Co., No. 311,584. Dated Feb. 3, 1885. The object of this rule-gauge is to enable the operator to mark off, with the assistance of a rule any stated width hy a continuous line accurately parallel with the edge of tbe material and also to enahle him to draw a line at right angles with the edge, whereby the device serves as a try-square. The invention consists in a plate, preferably of metal, so hent as to be adjusted upon the fingers of one hand, and having a flange against which the rnle bears, and one end at a true right angle with said flange to hear against the edge of the material.

WALL PAPER CUTTING MACHINE.—James C. Van Horn, Livermore, Cal. No. 312,043. Dated Feh. 10, 1885. This device is for trimming wall paper after the paste has heen applied and the paper is ready to he placed on the wall. It consists of a circular rotary hlade, journaled in an adjustable slide, which is arranged to run forward or hack npon a guide ahove the edge, to he cnt or trimmed. This trimming, when done in the old way with a knife and straight edge, is apt to he imperfect, because the knife used in that way will sometimes follow the grain of the board npon which the cutting is done, and hy rnnning out of line will spoil the edge of the paper. With this new rotary knife, fitted in the slide, this is impossihle.

AUTOMATIC FEEDING AND WICK-RAISING LAMP.—Thos. A. Fitzsimons, S. F. No. 311,972. Datcd Feh. 10, 1885. This is a new and usefnl self-feeding lamp and clock attachment for feeding the wick, and it consists in an oil reservoir, from which is suspended, hy an air and an oil pipe, a peculiar cup containing the hurner mechanism, to the wick of whicb a feeding device is applied, to which motion is transmitted to feed the wick hy snitahle gearing, connected with a clock suspended from the top. The object of the invention is to provide a lamp capable of hrning a considerahle time without attention, hy reason of the automatic feeding of the oil and wick, and therefore particnlarly adapted for use in churches as a sanctuary lamp, the light of which is not intended to he extinguished. The further object is to provide in a practical manner for a comhined lamp and timepiece, whereby the functions of hoth may be exercised, and their nses enjoyed together.

JACK-SCREW.—Walter W. Vaughn, Stockton, assignor of part interest to Asa Clark and O. G. Langmaid, No. 310,100. Dated Dec. 30, 1884. In the raising of hnildings or other heavy objects, it has heen a practice to either work with two sets of screws, one of which may he run up to the greatest height, and timhers are put in and another set pnt on, or the weight may he lowered on these timhers and the screws when only one set are nsed, and set npon new blocks for another raise. In some cases, a separahle nut has been used, which may he opened and moved on the screw, after the screw has heen turned through it to the greatest distance. TLe new invention of Mr. Vaughn, consists in a mechanism hy which the screw may be supported after it is raised to its highest point, so that the nut may he relieved from the pressure and "fleeted" or run np to the top of the screw, where it will again he supported hy new timbers, so that the screw may he turned np through the nnt, and the hnilding raised another length, the operation heing continuous without removing either screw or nnt.

FRESH discoveries of silver are contiuually heing made in various parts of New South Wales, Anstralia, several heing of great richness. The popnlation of Silverton, which a couple of years ago had no existence, now exceeds 5,000. Capital to a large extent has heen snbscribed for working the mines, and Silverton is likely to become one of the largest and most flourishing towns in the colony.

DELINQUENT NOTICE.

Fremont Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador county, near Drytown, California.

NOTICE. There are delinquent, upon the following described stock, on account of Assessment (No. 1) levied on the twenty-ninth day of December, 1884, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.

THE JENKINS STANDARD PACKING

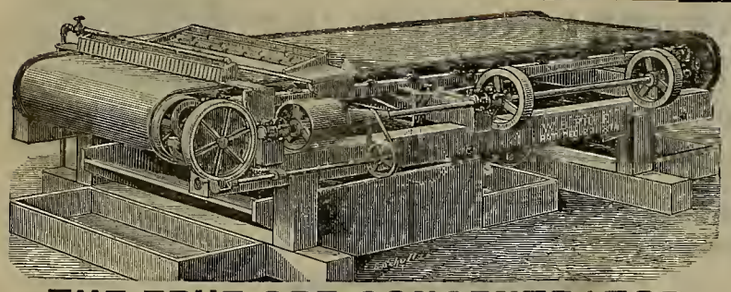
IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The **genuine** has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally,

Manufactured only by

For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal. JENKINS BROS., 71 John St., New York.

$1,000 CHALLENGE!

C Hendel Apr24 '85



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrato r Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can he seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, an ' can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

PACIFIC IRON WORKS
1850. 1885.

RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

HOISTING WORKS

Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

Adapted to all Requirements.

Electric Mining Machinery.

The latest improvement in mining machinery is that of the "Wiswell Electric Ore Pulverizor and Amalgamator Combined," an engraving of which is shown on this page, and which will interest mining men. It is confidently claimed by the manufacturers that this mill is capable of doing more and better work than others heretofore offered to the mining public. The points of superiority of the Wiswell Electric Mill and Amalgamator claimed by the company are as follows:

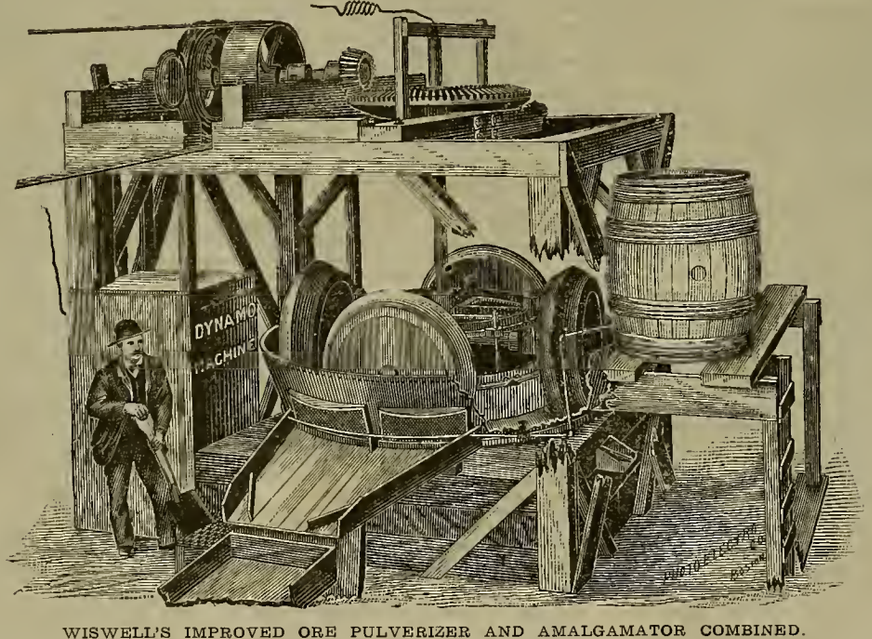
"First, that its first cost is not one-half the cost of a stamping battery of sufficient capacity to do the same amount of work; second, it takes but half the power to run it; third, the wear and tear of the mill is not one quarter part that of a 20-stamp battery; fourth, the quality of work done by it is superior to that of the stamp mill; it makes no slimes, crushes to uniform fineness, does not flour mercury, and can be cleaned up in five minutes without stopping the mill, simply by discontinuing the feed and opening the tap-off flow; fifth, amalgamation may be carried on in the same operation with the pulverizing, by placing the mercury in the mill while grinding, and tapping off the amalgam at suitable intervals without stopping the mill or interfering with the grinding; fresh mercury being put in to replace that drawn off in the amalgam; in this way the pulverization and amalgamation is carried on simultaneously and continuously throughout the 24 hours."

"Sixth, and chiefly, the long and earnestly sought for application of electricity to the operation of disintegrating the ore, and accelerating the process of amalgamation, has at last, by this mill, been practically and successfully accomplished. By certain processes patented and owned by this company, a constant current of electricity, of any desired force, is passed through the pulp while saving grinding, resulting in the of from 25 to 30 per cent more gold or silver, than can possibly be accomplished without it. Extravagant as this statement may seem, it has been more than fully borne out by actual test and experiment; the average result of numerous experiments with free-milling and sulphuret ores being a saving of 78½ per cent of the gold contained in the ores, as shown by fire assay when worked with electricity, as against an average saving of 52 per cent from precisely the same ores, when worked without electricity. The establishment of these facts is sufficient to show that this mill, with its electrical attachments, is destined to effect a complete revolution in mining."

The following paragraph from the circular of the company shows the claims concerning the electrical action:

"To those familiar with the results of the experiments that have from time to time been made to test the effect of electricity in separating gold and silver from pulverized ore, no explanation is needed to account for the astonishing results here claimed. But, for the benefit of readers who may be entirely unacquainted with the facts proved by the experiments of past years, we will simply say that the effect of the electric current in the pulp is to entirely cleanse the particles of gold and silver from every kind of tarnish, and it not only precipitates the float gold or silver which has hitherto proved so vexatious a source of loss in milling operations, but it quickens the action of the mercury and keeps it in the best possible condition for saving the precious metal, and thus, by overcoming the two chief obstacles at present existing to successful amalgamation, insures the saving of at least eighty per cent of the precious metal contained in the ores."

Numerous machines are being put up in this and adjoining States, and the company feel assured that the result of their performance will be such as to justify the statements here made. The office of the "Wiswell Electric Mining Machinery Co." is at 106 Leidesdorff St., San Francisco, where any further information can be obtained; and one of the mills can be seen in actual operation every Tuesday and Friday afternoon, at 461 Howard street, next to the shot tower.



WISWELL'S IMPROVED ORE PULVERIZER AND AMALGAMATOR COMBINED.

THE secretary of the Immigration Association states that great numbers of men, out of employment have called upon him during the last few days, seeking work, a great many of them foreigners, and also numbers from Oregon and Washington Territory. The association wishes it stated that it has never advised immigrants to come here unless they have $100, $500 or $1,000, and also wish to make known that it is only at certain periods of the year that there is a great demand for labor.

UNIONVILLE, in Humboldt county, Nev., is experiencing a revival, and rich ores are being found in several old claims. The district was one of the first organized in that county.

LARGE amounts of gypsum are being constantly shipped from the quarries near Point Sal to San Francisco, where it is converted into plaster-of-paris.

Testing Gold Dust.

It is important in estimating the value of purchased gold dust, to carefully examine to see if there is any counterfeit or "hogus" dust present. If all from the same locality, the dust will have a uniform color. Any suspicious looking pieces should be set aside, and cut with a cold chisel while lying on a small anvil. A fair sample of the whole lot of gold dust under examination should then be placed in an evaporating dish, the suspected pieces being placed on top, and nitric acid poured over them. If any reaction takes place, such as effervescence or evolution of red fumes, or if the acid becomes colored, there is foreign matter present, and should this be the case, counterfeit or adulterated gold dust must be suspected. State Mineralogist Hanks gives the following method of manipulation for the detection of bogus gold:

Place two watch glasses, one on a piece of white paper, and the other on black or other dark color; then, with a glass rod, convey a few drops of the acid from the dish to each. To the white, add a drop or two of ammonia, until it smells strongly ammoniacal; a blue color indicates copper. To the other add hydrochloric acid in the same manner. If a white curdy precipitate forms, which does not dissolve upon the addition of water, silver is being dissolved from the gold dust in the evaporating dish. If the dust is of very low grade, these metals may dissolve in very small quantities. But such gold dust would be easily detected by its inferior color and appearance.

If no action is observed, even after heating the dish, there is no counterfeit present. Counterfeit gold dust is sometimes so heavily coated with pure gold (by the galvanic process) as to protect the base alloy from the action of nitric acid, hence the necessity of cutting all suspected pieces before submitting to the action of the acid. To remove the acid from the gold, wash with water thoroughly, and dry over the spirit lamp.

Sierra County Notes.

Bald Mountain Extension Company, Forest City, have cleaned up over $5,400 for February. Nearly 50 men are employed. Last Saturday night the steel wire cable broke while loaded cars were descending the incline, 260 feet long. One of the boys, by the name of Veal, employed at the mine, had the rare courage and presence of mind to jump on an empty car and chase the fleeing train down the tunnel, over 6,000 feet in length, and fortunately overtook and stopped it before the cars collided with the incoming train. Just now developments indicate the lead extends north. Everywhere underground there is a very curious and strange looking country.

Four feet of snow at Gold Lake, and five on encircling ridges. The snow is as hard as ice. The miners are ensured a good water season. Snow at Howland Flat is less than two feet deep. Most all the miners in Northern Sierra are working their claims, there being so little snow and not stormy weather enough to interfere with their operations. There are three and a half feet of snow on the summits. The miners are praying for more snow that must soon come.

Company Red Oak, near Saddle Back, are now in soft picking slate bedrock, and apparently near their pay lead. For a long time past, the rock was so hard that but eight feet a month was made, blasting with giant powder. Eugene Dewey, of San Francisco and New York, is largely interested in this property.

The Bald Mountain Company, Forest City, cleaned up last Sunday from the preceding week's labor 200 ounces. Their richest gravel, at the bottom of incline under the lava flow that cut away the upper channel, is very hard and requires blasting. One man is only able to roll out three carloads on a shift of ten hours. The lead is quite narrow. It costs $4 per carload by the time the gravel reaches the dump. The theory is that this fabulously rich channel extends for thousands of feet beneath the lava flow. If so, then the Bald Mountain Co., heretofore only coming back with their pillars, will have another indefinite lease of prosperity.

THE new Selby Reduction Works, Contra Costa county, near the Vallejo Junction, are being rapidly pushed to completion. The main building, next to the railroad track, is to be 350 feet in length, and already about 250 feet of the walls are up and roofed. There will be about 350 men employed. A 20-foot dam is being constructed near the head of Cervo Valley, forming a large reservoir to supply the works with water. The aqueducts, gates, etc., will cost about $14,000.

MR. J. B. RANDOL, of the New Almaden Quicksilver Mining Company, has presented a handsome gold watch and chain to engineer John Tonkin, of whose nerve in standing at his post at the time of the late boiler explosion at that place, saved the lives of the miners in the cage.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Legislative Relief for the Hydraulic Miners.

EDITORS MINING PRESS:—No person who mixes much with the more intelligent portions of this community can fail to have noticed how generally the decision of Judge Sawyer, in the Mining Debris suit, is condemned even by parties having no direct interest in the issue of that suit. Not that this opinion is always demonstrative, or even very pronounced, yet a conviction that an injustice has been done the hydraulic miners appears to be fixed and widespread, showing that the public conscience is uneasy on the subject, and that it cannot be reconciled to a policy, which, if adhered to, must inevitably work great hardships to so many of our citizens. Nobody questions the motives, the learning or the ability of Judge Sawyer, yet nearly everybody seems to feel that a great wrong has been done, and that it ought to be righted. The law may be against the hydraulic miners; the farmers may assail, and the newspapers denounce them, and still this latent sympathy will continue its spontaneous workings among the disinterested masses. Any judicial finding that fails to take in a fair share of the equities on both sides can never be final. The trouble in such settlement of issues is that they will not stay settled. Every rank injustice resurrects itself after it is thought to have been committed to final sepulture. Even when passed on by the court of last resort, a case of this kind is not disposed of. After it has been adjudicated by this tribunal, the party feeling aggrieved will appeal to the law making power for relief. Here is where it must ultimately go for correction, be the results in the courts what they may. As the representatives of the people, any action taken by the Legislature would, as embodying public sentiment on this subject, presumably prove satisfactory to all.

This being the case, why not pass the bill lately introduced by Senator Cross, in the Legislature now in session at Sacramento, and which, having been favorably reported upon by the committee on mines, to whom it was referred, there is reason to hope will be enacted into a law. This bill provides that parties interested in hydraulic mining may incorporate for the purpose of building dams and other works for retaining and impounding the debris from such mines, authorizing them to take under the law of eminent domain any ground required in the construction of these works. All monies needed to the above end are to be raised by assessment of the stock of the companies, ten per cent thereof being made payable to the State Treasurer to raise a fund out of which the dams are to be kept in repair, in case this should not be done by the companies. After these retaining structures have been built, it is, of course, understood that the hydraulic miners who have been estopped running shall be allowed to resume operations.

With a law like this, the miners would be restored to the status they occupied under Judge Temple's decision, who held that as soon as the *heavier* debris is completely impounded, the miners may again go on with their work. Judge Sawyer, on the other hand, made his injunction perpetual, suggesting that, if in the future any plan were adopted whereby the injuries complained of could be *wholly obviated*, then the court might be induced to modify the decree, or possibly suspend the injunction altogether. This is looked upon as equivalent to saying that work under no possible circumstances shall be resumed, inasmuch as the miners could not so effectually impound these slums, that no injury whatever could result to interests and properties below.

It is not my purpose to discuss at length the merits of a question that has already been so thoroughly investigated in the courts, but to merely invite public opinion to the fact, that it would be to the interest of all, that it should be disposed of by the Legislature, which can better deal with all the facts and equities in the case than it would be possible for the courts to do. This is a case in which the concessions cannot all be wrung from one side. Each must yield, and each suffer something. To attempt its adjustment on any other basis is simply to make it a judicial heir-loom that would lead to interminable contests between two of the leading industries of the State. HENRY DEGROOT.

San Francisco, Feb. 28, 1885.

WATER POWER.—There is sufficient water-power in South Carolina to turn the spindles of all New England, and yet most of the rivers run down to the sea unimpeded in their flow. The streams are never closed by ice, and they rarely ever rise so high as to interrupt the running of the mills that have been established on her banks. On every side there are the crude materials for the manufacture of almost an endless variety of useful and ornamental articles of commerce. The matchless climate and vast resources make South Carolina a paradise for manufactures. Enterprise and capital will soon utilize the superior facilities of the South to their fullest extent.

Just What's the Matter.

What all Want is More Money—Gold is King

Mr. Almarin B. Paule, the well-known mining man, contributes to the *Bulletin* the following terse and vigorous article, which might set the people of this city thinking of the future possibilities of our mining industry:

Years ago—yes 30 years ago, I first took up my pen to write for the *Bulletin*, in the interest that has done more to build up this State—to build up real estate, banking and individuals, than all the other industries combined, to-wit: Mining. Mining was the great invigorator of an energetic people, and it is to-day an interest and an industry that is to control the destiny of our people and State, for, with mining, hope will ever bring forth all the energies of man. History shows that in all ages when mining for gold and silver was the excitement, that civilization made the more rapid strides, and the masses were the more prosperous and happy. The golden age of Rome, was gilded by the treasures from her mines. The Dark Ages was the result of a vast decline in gold production. The grandeur of Spain was when Cortez unearthed the golden treasures of the Western world. California and Australia's gold production sent the world ahead hundreds of years, from what it would have been, without the $3,000,000,000 unearthed. It saved the civilized world from bankruptcy, misery and civil wars. It made men bold, energetic and thoughtful and these thoughts came from vigorous, healthy blood, and which has produced wonders for enrichiug mankind. When men have plenty of gold in their pockets, they think clear and with boldness—not only think boldly, but act boldly. They dare to do. And right here let me say, that the trouble of California to-day is, that we have been too neglectful of our gold industry. We have sought rather to destroy its productiou, overlooking the fact that "Gold is King" under all and every circumstance. It is a reproach, I admit, on the civilization of the age, that it is, but, being so, we must argue all things from conditions as they are. California has fallen off in product from $24,000,000 average which it held for ten years after the Comstock raided upon our mining capital, to but little over $15,000,000; a forced decliue, through these tirades against miuing—tirades backed too much by the agricultural, banking and mercantile interests, and now who suffers in business more than they? We hear men talk of "booms"—"booms" in real estate, "booms" in vineyards, "booms" in trade, and here let me ask how can there be any booms until the *people* have money to boom on? Oue will say money. Why the saving banks have $52,000,000 on deposit! On deposit? Where is it? I will answer, loaned on real estate—then where is the money? There is no getting a boom out of anything until we produce more gold to do business on.

Of all cities in the known world, uo city could revel in such golden grandeur as San Francisco, were the mining interest of this State properly appreciated, eneouraged and pressed forward. Some may say, we have millions in our commercial banks lying idle. What does the banking statistics of our twenty commercial and savings bank show—$8,357,000 as cash on hand, and $30,000,000 invested and loaned on bouds and stocks—mainly in bonds. Are bonds productive for the masses? Do they give employment to the laborer or needy? Lying idle in he vaults do they build manufactories? On the contrary, it is locked up money as far as being of any benefit to this community, outside of coupons. Then how much floating money have we out of a combined banking capital of some $116,000,000—less than $9,000,000, and to whom does this money belong? The few, not the many. Does this condition of things make prosperity for a people or State? Bu iness men ask "What is the matter?" Is it not clear just what is the matter? On all sides the cry is "Hard times—over-production." Would there be hard times if we had gold pouring into our vaults, as formerly, when the *extra* product every year over the present was equal to the sum total of cash on hand in all the commercial and savings banks of the city? Can there be any over-production of this metal, even though the whole populatiou of the State were engaged in mining? Prosperity in business comes from an abundance of circulating medium; hard times, from the contraction of it; hence under-consumption. For better times, as before stated, the *people* must produce more gold, and to produce we have got to mine for it. To build up San Francisco the community has got to build up, not tear down, one of the most valuable interests of the State.

The Flush Times of the Past.

Recall the "flush times" of the past, and what made them flush? The product of California and Nevada mines—*the solid gold and silver*. All metal produced is so much added to the world's supply—that received from grains, wool and wine is simply exchange—taken from Peter to pay Paul, but that from mother earth enriches all. I have spoken of Rome, in all her golden grandeur; with all her vast mineral domain, she had no golden fields of wealth, as has the people of this city, within a forty-eight hours' ride, and were our people to awake from their lethargic sleep, and show the enterprise and industry of the old Pioneers, they could build abodes, to rival the magnificent Palace of Ecbatana. Our moneyed men are given too much to "cent per cent," not development. There is certainly a great lack of stirring enterprise, compared with the past. California seems paralyzed; not wide awake to advancing her interests. Take, for instance, the New Orleans Expositiou. To be sure the State has appropriated $10,000, after considerable effort and loss of much valuable time. Take the Denver Silver Convention, which over one thousand delegates attended from the mining States and Territories, but no representative from California. Who should be more interested in this silver question than the business men of this city? The "great" commercial city of San Francisco, with the Orient facing us—with India alone, consuming $10,000,000 of silver per annum, which we, of this coast, should supply.

Silver in California.

Some may say California is only a producer of gold, not silver. This is an error. The whole White Mountain, the Inyo Range, and lower Sierra Nevada, are stored with silver. For more than 150 miles a silver belt is awaiting muscle and capital to develop it. In this question of the production of the precious metal, much is to be considered. Lessen the production and at the same ratio, lower must come the wages of every man who labors. The very tirade of the granger against hydraulic mining lessened the gold product in the past six years fully $50,000,000, and kept at least $30,000,000 of mining capital from coming to this State.

Relations of Labor to Mining.

The present trouble with our foundries and their wage-workers can all be traced to the past tirade as the cause of it. It threw thousands of men in the mountains out of employment, lessened the demand for machinery, and the recoil is now before us, not only with the foundries and their workers, but the entire business of the coast has to suffer. Not only is labor involved in this question, but the consequences of no work—poverty and an unsettled condition of society. Why? one will ask. Because all values are based on gold. It's all a simple, economic proposition, which a schoolboy should understand, and yet some very wise old men and "righteous" judges think that to keep muscle and money out of mining is bestowing a blessing, when, in fact, it is the fostering of poverty and distress. Taking into consideration the fact that gold plays so important a part in all the business and social relations of nations and individuals, and the further fact of its great decline in production, and its increased consumption in the arts, makes California, Australia and Siberia (which are the great gold-producing sections) localities of vital interest. We do not appreciate our wealth, or we would act with greater wisdom.

Influence on Trade.

What seems so surprising is that intelligent business men do not seem to consider the importance of the question of greater or less production of the precious metals, and as having so serious a bearing on trade and the value of labor, with its consequences, and particularly in this State. This I thus illustrate: The Chamber of Commerce when appointing committees for reports on the vital interests of this State, in order to find out what was the cause of depressed trade, left out mining, as having no bearing, or else from fear of a back lick from the granger. All this shows a short-sightedness (to be charitable) on the part of our broad-brained (?) commercial magnates. Well, the miner can stand it. "Gold is King," which the granger finds out as his mortgages come due and go under the sheriff's hammer for the lack of it. Some oppose mining because it is a gambling business. Well, what is not? Life is a gamble. Grain is a gamble. Marriage is a gamble. All mercantile pursuits are a gamble, and so much so that only about ten per cent avoid failure. And where is a bigger gamble than life, marine and fire insurance? And tell me is mining a higher gamble, conducted with capital, skill and economy? Now to review: We have got to revive mining. With our other material interests as they are, our very prosperity depends on it. To relieve labor, to save revolt, we must produce more gold. Every one, even though he does not mine, builds up his interests by giving aid and encouragment to those who do. When I speak of mining, I mean legitimate work, conducted with skill, honesty and economy. Thus a blind man can see what is the main trouble with business in this State. Now, how shall we improve it? As before expressed, build up that interest which brings forth new capital and more of it. Let mining receive its proper encouragement from every other interest. Let our miners push forward with more spirit, using the highest skill and economy for profit. The future will want all the gold that can be produced, for the world over Gold is King, and is yearly becoming more powerful. It is not elevating or encouraging to know that it is so; and here let me ask, how long will the financial world force it to rule the destinies of humanity.

San Francisco, February, 1885.

BOX WOOD.—The demand for box wood for engravers' use has so largely increased that the supply is running short, and the price is rising. The fineness of grain and toughness of fiber of the box wood render it peculiarly suitable for wood engraving, and it will be difficult to find a satisfactory substitute.

The Desilverization of Lead by Electrolysis.

The following is the discussion on the above paper, which we published last week:

Discussion.

C. Henry Roney, Philadelphia, Pa.: I would like to propound to Mr. Keith at least one or two inquiries. These are: Whether he finds there is any perceptible leakage of the residus through the cotton or muslin bags into the bottom of the vat; whether any of that residue is carried over mechanically in pumping up his liquid to the over-head system in order to keep up a constant circulation (for I suppose he means to convey solution of the same density); and, further, whether in the leakage of the vat, of which he speaks, any loss of electrical energy is transmitted to the earth.

Mr. Keith: The question of the mixing of the residues by passing through the bag has been thoroughly discussed, canvassed, and worked out, and we find that practically there is none. If those plates with their bags over them had to be handled in any manner, there would be some of the residue forced through the bags, but they are not handled; they are simply moved around through the solution, and we find no wash of any kind. What is rather remarkable is that the residues remain upon the plate until it is completely dissolved. By carefully removing the bag (cutting it so as not to drag it off) when the plate has been reduced really to the thinness of fine writing paper, it still apparently retains its original thickness and almost its original external appearance; but when touched, the linger (or whatever it is that applies the touch) sinks into it. This black, pasty-like material can be easily drawn off, so that the lead will remain underneath without any other coating. The motion of these anodes is through the solution, and they have no handling. The movement of the solution does not carry anything over the top of the bag, because the bag is drawn somewhat higher than its top. It comes just above the edge of the solution.

There is one additional point which I have omitted to state, having reference to

The Collection of the Lead.

There are scrapers which hang from the frames down between the cathodes; and when the anodes are moved around in the vat, these scrapers scrape off the lead-crystal deposit, and this deposit drops into the bottom of the vat. When cleaning up time comes, we withdraw the solution by means of a syphon over the top, and at the same time lift out the anodes. The cathodes are then lifted out, and, after that, we get into the bottom and shovel out the deposit of lead. This lot of crystalline lead remains, while under the solution, in a perfectly metallic form, utterly unaffected by oxidation or any other apparent action for an indefinite length of time. Some of it now in my possession has been kept in a bottle, under the solution, for a period of over six years and is as bright to-day as it was at the beginning. This demonstrates that there is no chemical action going on in the solution which would affect the lead.

With reference to the other question, as to a leakage of current, I would say that we found on an electrical test at the commencement, before the vats were filled with liquid, that there was practically no leakage of current with the electro-motive force which was used. Since that time there has been a slight leakage, but none of any account.

The amount of horse power which is consumed in the separation of this material is, we may say, merely nominal. The difference of potential at the binding-posts or electrodes of the vats is scarcely one-quarter of a volt. The current passing through is 1,000 amperes. This one-fourth of a volt and these 1,000 amperes are produced at less than a quarter of one horse power. The main consumption of energy is in overcoming the resistance of the conductors between the source of electricity and the vats themselves, and the conductors between the vats. For instance, the longest single piece of conductor is 28 feet of one and one-eighth inches round copper between the dynamo and the first vat; and my measurements show that one-third of the energy which is passed into this circuit is consumed in that particular copper conductor. So small is the electrical resistance to this conductor that in the ordinary electrical measurements such as prevailed two or three years ago it would have been set down as nothing; but it should be recollected that while in those days we were accustomed to deal with 1,000,000 ohms of resistance, we may now be obliged, in some electrical measurements, to treat of the millionth part of an ohm of resistance, and of all amounts of resistance approaching thereto.

R. W. Raymond, New York city: The merits of this process, as concerns the purity of the lead produced, are, of course, unquestioned and unquestionable.

The Drawbacks of the Process,

Economically, appear to fall under two heads, namely: First, the slowness with which it proceeds; thus causing an accumulation at one time of a large quantity of valuable material in the works, which in turn requires the constant use of a very large floating capital, where this material is high-grade bullion; the number of tons in the works at any one time representing a sum averaging probably $200 per ton, in gold and silver values alone, to say nothing of the

(*Concluded on page 159.*)

MECHANICAL PROGRESS.

Hidden Flaws in Metals.

What is really needed, says the London *Builder*, is some system, could such be devised, by which those hidden flaws which the very best metal made by the very best processes will sometimes contain, should be rendered patent to the eys of an inspector. Is there any chance of such a system being devised? It is clear that chemical tests are quite useless; they can tell nothing but the general composition of the metal. Electric tests may possibly yet be used with effect. They were proposed some years ago, and have been revived lately by Prof. Hughes, the inventor of the microphone. With this beautiful instrument, the "magnetic balance," he has proved that in wires or small pieces of iron, all peculiarities of the metal, including the existence of flaws, can be detected with ease and certainty. His invention has been freely given to the world, but heretofore the world (as usual) has been wholly indifferent to the gift. So far as we are aware, no railway or marine engineer has taken any steps with a view to ascertain whether a similar system might not be applied to pieces of large size, such as those required in actual work. Failing this, mechanical tests in a proper testing machine does not seem impossible. If the axle which broke at Pennistone, before having been set to work, had been subjected to a sudden cross-breaking strain, similar to that which caused its destruction, but very much below what it should be able to support with safety, we cannot doubt that the resulting deflection or bending would have been far greater than if the axle had been sound. What we would suggest, therefore, is that all crank axles, or other pieces of metal called to fill equally important positions should be tested by strains similar to those brought upon them by actual work, and that their deflections under those strains should be recorded. A few experiments would be sufficient to show clearly how great this deflection should be in the case of a sound and perfect axle; and if any specimen showed a deflection decidedly higher than the limit, it should be rejected as a doubtful quality. The expense of such a system would not be great when it once became a regular part of the manufacture of an axle; and it appears to us the only method by which a single faulty specimen can be weeded out of a batch of sound and satisfactory articles.

LUBRICATION TESTS.—Prof. Thurston has recently made several tests with the best sperm oil and graphite at the Stevens Institute, in New Jersey, with all the results in favor of graphite. Each test was stopped the moment the bearing "squealed." Eleven minutes used up the sperm oil, while the graphite lasted 38 minutes. The bearings lubricated with the best sperm oil cut; those with dry graphite or graphite oil did not. The tests were on close bearings, and very high pressure. One-third the quantity of dry graphite did nearly three times the lubricating of the best sperm oil. Long after the sperm oil was exhausted (it squeaked at 11 minutes), the graphite oil continued to lubricate without a cut. The average coefficient of friction was on oil .0555, on foliated graphite mixed with enough of water to distribute it over the bearings, was .0596, and on Dixon's graphite cylinder oil, .0936. Mixtures and quack nostrums are sold with high-sounding names, but the plumbago in them is all they contain of the least value, and it is much better to use it pure.

PROGRESS OF INVENTION.—A prominent engineer is reported by the New York *Tribune* as saying: "Scientific invention runs in grooves. Electricity has unquestionably been the great development of the past 20 years. While nothing is impossible, I think the limit of electrical invention has been reached. Applications of the inventions already made are engrossing attention. In that direction the great problem is power. It is a singular fact that since the discovery of steam and its application as a motive power, there has been no great invention in steam. Now that inventors are applying themselves to extending the electrical inventions, they find cheaper motors necessary. You will see that inventive genius will improve steam making by revolutions as wonderful as any that have taken place in other branches of scientific investigation. What discoveries will be made I cannot predict, but I believe the next step in scientific progress will be in that direction.

IMPORTANCE OF CLOSE OBSERVATION BY MACHINISTS.—Owing to the great demand for rapid workmen, it behooves the coming machinist to scrutinize the minutest details in all mechanical operations, in fact, substantial success depends upon this. The most careful and intelligent workmen are at times stranded, apparently upon the most insignificant trifles. Every mechanical operation is attended with its peculiarities, and I think the exchange of ideas by machinists will help to overcome the small difficulties that often cause much trouble, and which, unless vanquished, detract from a machinist's value.—*American Machinist.*

AN IRON UNIT.—If a bar of ordinary forged iron be planed up to measure one inch square, and the bar be one English yard long, it will weigh 10 pounds, and the tenth of such a bar will weigh one pound more accurately than will the ordinary liter of water weigh one kilo. The English engineer, in these days of iron, knows when he uses shapes of iron, rolled of uniform section, that the tenth of their weight in pounds per yard gives him the area of the section, and this one admirable incident will long fix the desirability of the present unit of England and America.—*Coleman Sellers.*

EFFECTS OF LONG CONTINUED HEAT.—The changes which thermometers undergo when heated for a long time have received the attention of the French Academy of Sciences. It appears from investigations made in this line that in manufactories of printers' ink, where oils are heated to a temperature of some 536° F. for many days, the most accurate thermometers often become so changed as to indicate errors of ten or more degrees. Similar changes of much lower temperatures are also mentioned. Thus the aerometers which are employed in sugar refineries where the molasses is treated by osmosis are plunged for many days in liquids which are heated to 203° F.; and although the temperature is below the boiling point of water it is found sufficient to completely modify the aerometers and to soften the glass enough to render them untrustworthy.

SQUARE HOLE AUGERS are now coming into extensive use. A company has recently been organized in Cleveland, Ohio, for their manufacture and the *Herald* of that city, thus describes the machine: The auger bores a 2" square hole, the size used in ordinary frame buildings and barns, but it can be made on the same principle to bore square holes of any size. Its application is ordinary and works on the same principle as round hole augers. Its end, instead of having a screw or bit, has a cam motion which oscillates a cutter mounted on a steel rocking knife which cuts on both sides. In order to prevent the splintering of the wood, the ends of the cutter are provided with small semi-circular shaped saws which help in cutting out perfectly square corners.

COLORING BRASS.—On brass, a technical journal says, a steel color is developed by using a boiling solution of arsenic chloride, while a careful application of a concentrated solution of sodium sulphide causes a blue coloration. Black being generally used for optical instruments, is obtained from a solution of platinum chloride to which tin nitrate has been added. In Japan the brass is bronzed by using a boiling solution of copper sulphate, alum and verdigris.

ROLLING STEEL.—A manufacturing engineer writes to *La Metallurgie*, Paris, claiming that the success of rolling steel rails depends upon the temperature at which the steel is rolled. He states in this connection, and from his own experience, that bars which were finished at a bright red heat—which were recognizable after cooling by their blue tint—were more fragile under tests by striking or flexion than those finished at a low temperature.

THE LARGEST IRON BLAST FURNACE.—Robert H. Coleman, the millionaire owner of the famous Cornwall iron hills, near Lebanon, Penn., has ordered plans to be prepared for the largest and most complete iron blast furnace in the United States. It is to have a capacity of 1000 tons per week, and is to be known as the No. 3 Colebrook Furnace, and will adjoin No. 2 Colebrook Furnace on the west.

THE LARGEST STEAM HAMMER in the United States has recently been placed in the works of the Cleveland (Ohio) City Forge and Iron Company. Its weight is about 20 tons; with that of the anvil and appendages, 340 tons. Its hight is 38 feet, and the diameter of the cylinder is 38 inches. It was made by the T. B. Miles Machine Tool Works, Philadelphia, and cost between $50,000 and $60,000.

CAST iron, if heated for several days to a temperature of from 900 to 1,000 deg. Cent., neither melts nor softens, but is converted into malleable iron. Its surfaces is covered with a grayish efflorescencs. Its fracture is sometimes of a uniform black, like that of a lead pencil, and sometimes riddled with large black points which are regularly distributed in the metallic paste.

SAND PAPERING MACHINES are said to be the greatest labor saving and most profitable that can be used in any wood-working factory, especially by furniture, bracket and chair companies. They will save from three to ten men's wages, and do the work in a far superior and more perfect manner. These machines are fast coming into use in Eastern shops.

A LARGE FORGING.—The Miller Forge Company of Pittsburg, Penn., has recently forged a large piece of iron of the following dimensions: Length, 6 ft.; cross section, 16½ by 48 inches. It is not every forge that can handle a piece of iron 4 ft. by 1ft. 4½ inches and 6 ft. long.

THE FIRST STEAM ENGINE was brought to this continent from England in the year 1753. Twenty-three years later—in 1776—the number of steam engines in the United States was but three.

A NEW IRON WORKS COMPANY has been incorporated at Portland, Oregon.

SCIENTIFIC PROGRESS.

California Rain Storms.

Much attention has been given, since the establishment of signal service stations here, to a study of the origin and course of Pacific Coast rain storms. Although the stations have been fewer than desirable, still much information has been gained, and it is expected that more accurate data will be acquired after the new stations promised shall have been established at Owen's Lake, San Luis Obispo, and several other localities not yet fully determined upon. There are now twelve stations in operation.

Lieutenant Robert Craig, of the Fourth Artillery, has recently been detailed by the Signal Service Bureau to establish a department of the service in this city. The lieutenant is the senior officer in the meteorological service of the Government, and has devoted a portion of his study to the laws of storms on the Pacific Coast.

In a recent interview with a reporter of the *Call*, the lieutenant remarked that he regarded the Pacific Coast

A Very Interesting Meteorological Area,

and trusted that the service to mariners here will soon be as beneficial to them as it now is to those on the Atlantic seaboard. Continuing his remarks, he said:

"But that is hardly probable, for the reason that the storms on this continent almost invariably travel from the west to the east, so that the Signal Service Bureau has the vast area of territory west of the Atlantic shore line to observe for the purpose of ascertaining the movements of the air currents. For instance, if a storm strikes Washington Territory and blows eastward, we are able to warn ship-owners in New York a day or more before it reaches the Atlantic States. The office on this coast becomes, therefore, a very important adjunct to the bureau, because it learns first of the approach of the storms. Although the establishment of an office here will perhaps be of great er direct importance and benefit to the East than the West, yet it will render very valuable information to mariners here. The office that I shall open in a few weeks will be connected with the twelve observing stations already established on the coast line, and also with the stations at Spokane Falls, Boise City, Winnemucca and Yuma. In addition to reports from these places, I hope to promote the habit among shipmasters of taking observations at sea and reporting them to the office. In this way I shall be able to make up a chart showing the track of storms on the water as well as upon the land."

"Have your observations been extensive enough to enable you to give the general trend of the storms on this coast?" asked the reporter.

The Course of Storms.

"Yes, and I might say now that there is a very erroneous opinion among Californians in regard to the quarter of the compass from which the rainstorms come. I found that it is the popular opinion in the State that the rain usually comes out of the south. That is a mistake, just as the old belief, which was corrected by the progress of astronomy, that the sun revolved around the earth, instead of the earth revolving around the sun. Nearly all the storms in this State, both of wind and rain, come from the north. Only very seldom does a rain come out of the south. The farmers and horticulturists here look to the southern sky and watch for that balmy, humid breeze which experience has taught them almost invariably precedes a rainstorm. While their faces are turned to the south to see the storm approach, the rain comes up behind them."

"But the wind usually blows from the south when it rains."

"Yes, that is true, but that is not the wind that brings the rain. The area of a rainstorm varies in shape from an ecliptic to a circle, with a diameter varying from one hundred to several hundred miles; sometimes it is much less. In that area the wind blows from east to west on a path that approaches the center like the thread of a coiled spring. There is, then, that storm area with its own interior currents. Now as that whole area moves southward the neighboring atmosphere is sucked into the interior currents of the area; so that while the storm area is coming south it draws the air from the south to it, which forms the wind from the south that the farmers observe just before a rain. The southern wind is really drawn into the powerful currents that travel around the center of the storm area, and finally goes up in a whirlwind and is lost in the upper strata of the atmosphere."

"What is the course of the storms that come in from the Pacific?"

Storms from the North.

"Most frequently the storm touches the northern shore of Washington Territory and travels over the southern part of that country, or passes into British Columbia, or goes southeast across Idaho and Montana. Less frequently the storm blows across the southern part of Washington Territory, over Oregon to Utah. Occasionally the storm strikes Oregon, and comes south, travelling down California to Arizona and over to Texas. A storm center very rarely comes from the Pacific directly through the Golden Gate, and it is still rarer that a storm blows out of the south. I remember of tracing a big storm three years ago that took this course: it touched the land at the northwestern shore of Washington Territory, went south across Oregon, down through the Sacramento and San Joaquin valleys, over Arizona, New Mexico and Texas, and then turned northeastward, passing across the Southern and Middle States, spending itself in the St. Lawrence basin. That was a long track, yet I followed the storm's course as easily as one can follow the flight of a bird with the eye."

Value of the Signal Service.

"Has the Signal Service Bureau ever estimated the value of the meteorological observations and warnings to the shipping interests?"

"That is a very difficult question to answer. We are constantly receiving resolutions of thanks from the boards of trade and chambers of commerce, and communications from private individuals, for valuable advice and timely warnings, but the bureau has never been able to calculate, in dollars and cents, the exact value of its predictions. On one occasion, just before two violent hurricanes burst over the Atlantic we gave warning and succeeded in detaining about $10,000,000 worth of shipping in the harbors till the fury of the tempest was broken. That shipping would all have been in the hurricanes if our warnings had not been heeded; but of course it is impossible to say whether any of it would have been destroyed, although it is very probable that it would. To answer your question directly, I will say that no estimate of the value of the service has ever been made."

THE LATE SPANISH EARTHQUAKE.—A scientific commission has been appointed and sent out by the Government at Madrid to visit the scene of the late Spanish Earthquake. This commission has already sent in several reports in the interest of science. One of the most remarkable phenomomen noted by the commission is that of the complete obliteration of the high road leading to Periana, no certain trace of which can be found for several miles outside of the town. The road, in most places, lay between abutting hills, and in the recent terrific disturbances of the earth's crust, it seems to have been forced downward or engulfed. Many of the hills themselves were levelled beyond recognition, and well-known landmarks, whose positions had remained undisturbed for centuries, were moved a distance of 30 yards.

ANTIQUITY OF MAN.—Evidence seems to be fast accumulating that man has existed a much longer time on earth than was ever dreamed of by scientists half a century ago. Man, according to Mr. J. W. Knowles, must have taken up his residence in Ireland at a very early stage in the history of the world. Mr. Knowles has discovered flints at Lane and other places on the northeast coast of that country, some of which he believes show evident traces of human workmanship. One large chipped implement was found in what appeared to be true undisturbed bowlder clay. There are other tools which Mr. Knowles has in his possession which seem to indicate that man has lived in Ireland long before the paleolithic period, during, in fact, the glacial epoch.

TAKING TELEGRAPHIC REPORTS WITH A TYPE-WRITER.—According to a statement in the Nashville *American*, there are only two telegraph operators in the United States who can successfully use a type-writer in receiving the hulky reports of the Associated Press. One of these operators is in Nashville, the other in Elmira, N. Y. But if these men can take reports with a type-writer, of course others can learn to do it, and it is said that many other operators are considering the subject of fitting themselves with machines and learning to use them. It would certainly be a great advantage to telegraph editors and compositors.

CAUSE OF THE SETTLING OF THE PHILADELPHIA CITY HALL.—Philadelphia has a sensation over the reported settling of her immense new City Hall, now in process of erection. It is said that the weight of the hugs towers of masonry is crushing the stone underneath, and that great splits are visible in the walls in many places. Some of these unfortunate results are due to hasty and imperfect bricklaying, and a gang of workmen has been employed to cut out this insecure part and relay the structure in a substantial manner.

REDUCING ANIMAL TEMPERATURE.—Professor Preyer, of the Jena Natural History Society, has been experimenting with Guinea pigs as to the best method of reducing the temperature in animals. Employing a finely divided spray of water of the temperature of 45 degrees F., he reduced the heat of a pig 2 degrees in five minutes. With spray at 70 degrees it took 20 minutes to work the same result. He suggests that the method might be applied to fever paroxysms with success by physicians.

AN ELECTRICAL BATTERY WORKED BY SUNLIGHT.—It is said that a German electrician has invented a battery which will do wonders if its plans could only be carried out. The electric battery is to be worked by sunlight mostly, if not entirely, and the cost of the other elements could be reduced to a minimum. If cheap and portable accumulators could be made for storing the electricity the sunlight of a single summer could be made to store up force enough to drive all the mills and railroads for years.

TABLE OF CONTENTS.

EDITORIALS.—Electric Mining Machinery; Testing Gold Dust; Sierra County Notes, 153. Passing Events; Let the World Make a Note of It; Gas Coals; The Iron Workers; Heating Feed Water for Steam Boilers, 156. The New Judson Drill; Carbons; Electro Metallurgy; Fresno Mines; Graphite, 157.

ILLUSTRATIONS.—Wiswell's Improved Ore Pulverizer and Amalgamator Combined, 153. The New 26-inch Drill of the Judson Manufacturing Co., 157.

CORRESPONDENCE.—Legislative Relief for the Hydraulic Miners, 154.

MECHANICAL PROGRESS.—Hidden Flaws in Metals; Lubrication Tests; Progress of Invention; Importance of Close Observation by Machinists; An Iron Cuit; Effects of Long Continued Heat; Square Hole Augers; Coloring Brass; Rolling Steel; The Largest Iron Blast Furnace; A Large Forging, 155.

SCIENTIFIC PROGRESS.—California Rain Storms; The Late Spanish Earthquake; Antiquity of Man; Taking Telegraphic Reports with a Type-Writer; Cause of the Settling of the Philadelphia City Hall; Reducing Animal Temperature; An Electrical Battery Worked by Sunlight, 155.

USEFUL INFORMATION.—Art in Oiling Shoes; Why Kerosene Oil Barrels are Painted; Waxing Floors; New Material for Clothing; The Mason Cotton Picker; An Inexpensive Filter; Use for Spent Tea Leaves; In Canning Fruit, 159.

GOOD HEALTH.—Effect of Alcohol on the Human System; Inhaling the Smoke of Cigarettes; Death-Dealing Dish Cloths; Effective Cures; Onions as a Disinfectant; Hartshorn for Stings, 159.

MISCELLANEOUS.—The Desilverization of Lead by Electrolysis; Just What's the Matter, 154. San Joaquin and Sierra Nevada Railway, 158.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 160-61.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 164.

Passing Events.

The nation has this week experienced a change in the head of the government, President Cleveland having been inaugurated with suitable ceremony on the 4th inst.

This week also closes the session of the California legislature, which has, by the way, not done nearly as much practical work as was expected of it.

There is still trouble among some of the iron workers at our largest foundry, where the helpers had their pay reduced from $2 to $1.75 per day. The matter has not yet been settled.

Up at Eureka, Nevada, some of the largest works have been closed down, and it is not known when they will be started up again.

We note from our interior exchanges that prospectors are beginning to range the mountains once more in search of quartz.

There is still considerable excitement about New River mines, and it is likely there will be quite a rush there shortly. Many men have already gone. Those who do go ought to provide themselves with means of returning in case of disappointment, for everybody is not likely to strike a rich claim.

MR. B. B. THAYER, an old pioneer chemist and druggist, and for many years manager of the Guadalupe Quicksilver mine, near San Jose, died at the mine on Tuesday.

WE received at this city 89,303 tons of coal in February and March.

Let the World Make a Note of It.

It may be well for people abroad to understand what is so well understood here, that we are on the eve of a new gold era in California. We speak advisedly; we are not writing at random; but have the data at hand to warrant what we say. There is likely to arise here, and even exists at present, such a condition of affairs as must soon impart renewed vigor to, and insure for the business of gold mining a long and prosperous life in this State. The facts on which we found this opinion are indisputable—are so tangible and certain that they may safely be adopted as the basis of any, even the most extended enterprise connected with this branch of mining. We do not say, for we do not believe, there is going to occur in California any great excitement or so called "boom" in connection with gold mining, either placer or quartz. Of this sort of thing we have had too much already, and it is gratifying to think that its day is well nigh over. As our miners have got done with stampedes and rushes, so have investors got done with premature expenditures and wasteful speculations, and when we speak of increased activity in mining we only mean that our people, finding that the business rightly conducted can be made to pay, are for that reason engaging in it more largely than ever before. If mention is made of a new and promising mineral district, it is not meant that men can repair to such district and there make money without the exercise of ordinary business sense; but only that there exist there latent opportunities, which, to be made available, require the intelligent application of labor and capital. When the *Rural Press*, our confrere in the agricultural world, describes the orange and lemon orchards of Los Angeles it does not mean that nature has produced either, only that the soil and the climate of that region, being so extremely favorable to the growth of these citrus fruits, has induced man to come in and here plant the same extensively. So of our mineral resources; nature has placed them in the mountains under conditions that greatly tend to encourage their development. Still, man must come in and do his part, the same as in the growing of fruit or grain.

At one time the agricultural resources of California were thought to be of a very low order. Now they are known to surpass those of any other part of the world. A few years since gold mining in this State, having been long on the wane, was supposed to be nearing its end. To-day it looks differently—looks as if the business were about to take a new lease of life. Gains pervade every department of this industry. We have gained in the matter of economizing labor and expenditures, in the extraction and working of the ores, and in the finding of new and the more thorough exploration of old deposits, the latter amounting often to a rediscovery, in that, the extent and value of these deposits have greatly exceeded all previous expectation. Grounds traversed by trails for thirty-five years, and which during all this time attracted little or no attention, are now found to be rich in gold-bearing quartz lodes or other form of auriferous deposit. The hydraulic banks along the Klamath, worked for many years and generally in a small way, turn out to be in themselves a great gold field, from which millions might annually be taken out without working them in an exhaustive way. The gold beaches and bluffs along our sea-coast, nearly abandoned for years, are likely to become very soon once more the theater of active operations, while the tailings that have accumulated in such quantities along the interior river channels seem destined also to be moved and rewashed with profit.

Looking up and down the principal mineral belt of the State, we find new mining centers springing up at different points along it. At its end a silver producing region has sprung into existence during the past three years which is turning out that metal at the rate of $5,000,000 per annum, with a prospect of doubling this production in the early future. Centrally on this belt is situated the Washington district, revealing an astonishing wealth of auriferous quartz, while at its northerly end we find the New River country, still more extensive and equally rich in this class of deposits. That both of these localities are to meet with early and energetic development admits of no doubt, the former, aside from its other attractions, being recommended on account of its extreme accessibility. New River, though not so easy of approach just now, will soon be rendered almost equally accessible, a wagon road having been projected from Humboldt bay to the mines. The route of this road is now being surveyed by a company organized for the purpose of building it. The work of its construction has been committed to James H. Crossman, formerly of this city, now a resident of Eureka, Humboldt county, and largely interested in these New River mines. Crossman being notoriously a man of energy and push, it may be expected that this road will meet with early and successful construction.

A road is also to be built into that region, it appears, from Etna, the principal town in Scott's Valley. This road is not designed for the transportation of machinery or merchandise, but for the shipment to New River of farming produce, fruits, etc., Scott's Valley being one of the finest agricultural districts in the State. With the principal staples of subsistence supplied at reasonable rates, as they no doubt will be by means of these wagon roads, the cost of living at these New River mines cannot be very great. So far general attention seems to be turned strongly to this, the latest discovered gold field.

Gas Coals.

We have no coal in California which is fit to make gas, and in fact what coals we have here are very poor. The coal used by the gas companies is all imported. Coal for gas should contain but a small proportion of sulphur compounds, as it is then easily purified, requiring less lime, producing a better quality of gas, and the coal may be safely stored without danger of spontaneous combustion.

Good gas coal should not require more than one bushel of lime to purify 5,000 or 6,000 feet of gas. The sulphur in coal is sometimes in combination with iron; in other cases it passes off in a volatile state, leaving but little in the coke. For gas making this latter is a disadvantage, as the less sulphur entering the gases the better, since it must be removed by purification. For the blast furnace, on the contrary, the less sulphur remaining in the coke the better, since it is the sulphur in the coke which is injurious, and not that in the hydrocarbons, which passes off at the top of the furnace stack. In some cases, however, when the gas carries with it most of the sulphur, the gas may be so superior in illuminating power as to warrant its use, notwithstanding its increased cost of purification.

A ton of good coal used in the making of gas should produce 35 to 40 bushels of coke, weighing 35 pounds to the bushel. The coke is used for heating the retorts. Should there be a surplus of coke where a large amount of gas is made, this is a valuable merchantable product, especially in a place like this where coal for domestic purposes is comparatively expensive.

The Iron Workers.

Although most of the men at the foundries have gone back to work at the old wages, there is little doing in the shops and none of them are working full-handed. The proprietors maintain that it will be impracticable to continue for any length of time at ruling rates of wages, while the mechanics are as firm in the belief that no reduction should be made. At one of the largest works the helpers have been notified of a reduction of 25 cents a day in their wages, and the men at once quit work. Meetings of sympathy have been held by some of the labor associations. On Wednesday the moulders at the Union Works quit in a body and went out to join the helpers. On the same evening the moulders and helpers from the various shops held a meeting, and the committee appointed to confer with Mr. Scott made their report, that he had said that he would employ a certain number at the old rates, but reserved the right of employing others at whatever wages he chose.

Mr. Scott is quoted as having told the committee that the trouble had been caused by a misunderstanding. The order issued was intended to affect only new men, who were to be employed at a 15 per cent reduction, beginning March 1st, while the old hands would continue to receive $2.

The differences are not yet settled, as will be seen from these statements.

Heating Feed Water for Steam Boilers

While many engineers know that there is a saving of fuel by heating the feed water for steam boilers, perhaps not a great proportion know just how much gain there is in heating feed water a certain number of degrees; for instance, in one boiler the feed water may be heated to 120 degrees, and in another boiler it may be heated to 180 degrees, and it is often times desirable for an engineer to know how much coal would be saved by giving the additional heat of 60 degrees, from 120 to 180, or in another case, the water fed into a boiler may not be heated at all by a heater, and its temperature is, say 60 degrees; but it is desired to know how much saving of fuel there would be if the water could be heated to 160 degrees. There are simple rules by which the degree of saving may be found, and we will explain the method of doing this, and also give a table which will be useful to the engineer and save him the trouble of even making the simple calculation necessary. We find, by looking at tables which contain the "Properties of Steam," that the total heat in steam varies with the pressure, and that in steam of atmospheric pressure the number of units of heat is 1178.6. At 50 pounds pressure there are 1205 units of heat; at 100 pounds pressure, 1216.9 units; at 150 pounds pressure, 1225.4 units, and at 200 pounds pressure, 1230 units.

When we want to find how much work a pound of coal is doing in evaporating water under pressure, we must know what that pressure is so that we may know how many units of heat go into each pound of water. For instance, in steam at atmospheric pressure there are 1178.6 units of heat in each pound, and in steam of 200 pounds pressure there are 1230, or 51.4 more units than in steam of atmospheric pressure, which is 4 3 per cent more heat necessary to evaporate a pound of steam under 200 pounds pressure than if under only atmospheric pressure.

Now suppose we have a boiler which has the water pumped into it without being heated at all—say 60 degrees of temperature, and suppose that the boiler is worked under 120 pounds pressure, and that under these conditions one pound of coal evaporates seven pounds of water. We want to know how much more water would be evaporated by each pound of coal if the water could be heated up to 180 degrees. We first must know how many units of heat there are in each pound of steam of 120 pounds pressure. We find by looking at tables of the "Properties of Steam" in any engineer's pocket-book that there are 1220.6 units, and as the feed water goes into the boiler at 60 degrees, the coal has to give out 1220.6—60=1160.6 degrees of heat to each pound of water evaporated—but each pound of coal evaporates seven pounds of water, consequently seven times 1160.6 is 8124.2, which are the total units of heat given out to the water by each pound of coal; now if we can by a heater add 120 degrees of heat to each pound of water, raising it from 60 to 180 degrees, that will be for seven pounds, seven times 120=840 units of heat, and this 840 added to 8124.2 is 8964.2, which is given out by the heater and the one pound of coal. We have seen that in one pound of steam of 120 pounds pressure there are 1220.6 less 60=1160.6 units of heat to be imparted. Now divide 8964.2 by 1160.6 and we have 7.72 pounds of water which will be evaporated by one pound of coal when the feed water is heated to 180 degrees and only seven pounds of the water goes into the boiler at 60 degrees—that is a gain of over 10 per cent in the quantity of water that would be evaporated per pound of coal.

If we could use the steam at atmospheric pressure and heat the water to 212 degrees, we would have a still further saving, as in this case only 966.6 units of heat would have to be given off to each pound of water, and as 8124.2 units of heat are given off by one pound of coal, this divided by 966.6 would give 8.4 pounds of water evaporated at atmospheric pressure. It is now customary to rate the economy or efficiency of boilers by comparing them with some standard condition, and the condition which has been adopted is that of having the feed water heated to 212 degrees, the pressure to be that of the atmosphere, only; and in constructing the table, the number of units of heat which have to be supplied by the coal under this condition will be 966.6, as before stated.

Every pound of pressure which is added increases the number of units of heat to be furnished, and also every degree of temperature which the feed water is reduced, from and below 212, requires an additional unit of heat to be furnished by the coal. If we take this 966.6 units for a standard and let it represent one, then each pound of pressure added will add to it, and so will each degree of temperature taken from the feed water. By looking in any column under the pressure of steam which is carried by the boiler, and in this column, in line, with the temperature at which the water is fed into the boiler, will be found a number which represents the increased quantity of coal necessary to evaporate water above what would be required if the fuel was 212 and the steam at 0, or atmospheric pressure.

Thus suppose we are carrying 100 pounds of steam and the feed water is going into the boiler at 70 degrees temperature; in the column under 100 and opposite 70 we find 1.185, and supposing that we are evaporating seven pounds of water per pound of coal, by multiplying 7 by 1.185 we get 8.295 which is the number of pounds of water that would be evaporated per pound of coal if the standard conditions were obtained; and so with any other boiler or conditions of boiler pressure and temperature of feed water.

We can also make comparisons between two boilers; thus, let one boiler carry 50 pounds pressure, and have the feed water heated to 100 degrees, and let another boiler have a pressure of 100 pounds and feed at 50 degrees. Look under 50 and opposite 100; we find 1.142. Now, look under 100 and opposite 50 and we find 1.206. If each boiler evaporates 7 pounds of water per pound of coal, we find by multiplying each by 7, thus, 7x1.142 7.994 pounds of water would be evaporated by the first boiler under the standard pressure and feed, and 7x1.206 8.442 pounds of water would be evaporated by the second boiler if put under the same conditions, so that the second boiler is the best. If the second boiler only evaporated 6 pounds of water per pound of coal, then 6x1.206 7.236 pounds which it would evaporate under the standard conditions. The comparisons of any boilers working under other pressures and temperature of feed, may be made in the same way.

This table is made by taking the units of heat in a pound of steam at any pressure, and, deducting the temperature at which the water is fed into the boiler, dividing the remainder by 966.6.

Temp. of Feed Water.	BOILER PRESSURE ABOVE THE ATMOSPHERE.

While two miners—H. Forbes and John Barrett—were at work on a claim at Gibsonville, they were washed into the flume and carried a distance of 2000 feet before they managed to get out. Their escape from death is almost miraculous.

A large meeting has been held at Etna, to build a trail to the New River mines. A subscription was started to put men at work, and the miners at New River are also taking similar action to build the trail. A pack train will leave next week with supplies.

The New Judson Drill.

The accompanying engraving represents the new 26-inch drill, made by the Judson Manufacturing Co., of this city.

This pattern is new and extra heavy. The material and workmanship is first-class in every particular.

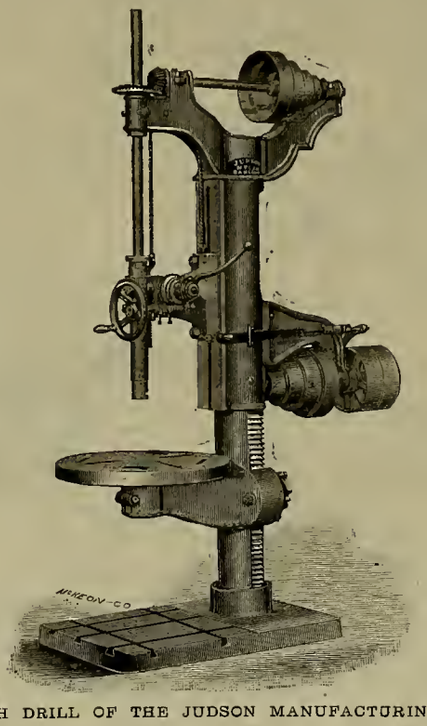
The spindle and head is counter-balanced with chain and wsight, with a vertical adjustment of 20 inches. The spindle is made of hammerod steel, bored out to fit the No. 3 Morse Drill Socket, and has eight inches of travel.

The quick return attachment is very strong, simple, and perfect in its action.

The face-plate swings round the column in any position. Can be raised or lowered 18 inches, and will receive work 32 inches high and 26 inches in diameter. The bed-plate is planed, and will receive work 46 inches high.

The pinion and rack for lowering the table is placed on the side, and revolves with the table. in this position, the dirt and borings falling from the table, cannot get in the rack.

The pulleys on the lower cone shaft are 10 inches in diamster for 3-inch belt, and should run 250 revolutions per minute. There are



NEW 26-INCH DRILL OF THE JUDSON MANUFACTURING COMPANY.

four belt speeds on the cones which are turned suitable for a 2½ inch belt. This machine weighs 1500 pounds and costs $275.

The Judson Company also manufactures a pulley-drilling machine for drilling the set screw holes in pulley nuts without drilling through the outside rim. It can be attached to the drill in one minute, simply by removing the face plate and resting the pulley-drilling attachment in the face plate socket. It weighs 50 pounds and costs $50.

Carbons.

Borts, black diamonds, carbons or carbonados, as the black variety of the diamond is variously called, are used more and more extensively in the arts every year. This substance is employed largely in diamond drills used in mining and for stone sawing machines, etc. It consists of pure carbon excepting from 0.27 to 2.07 per cent. Its specific gravity ranges from 3.012 to 3.416. In size, shape and temper there are very great differences. Pieces from 400 to 700 karats have been found. The supplies used in this country came from the province of Babia, in Brazil. Carbons have also been reported to occur in South Africa, India and Russia, but these occurrences have not been authenticated.

Very frequent discoveries of carbons are reported to have been made in the United States, but the supposed black diamond is commonly found to be titanic iron, easily crushed to dust by a light hammer or by strong pliers.

Traffic over the Brooklyn bridge is rapidly increasing.

Electro Metallurgy.

Mr. N. S. Keith, the writer of the article on the "Desilverization of Lead by Electrolysis," which is published in another column, has lately become a resident of this city, where he is engaged with the Pacific Coast Electrical Construction Company. Mr. Keith was formerly one of the editors of the Electrical *World*, and still writes for that journal. He is now engaged upon the electric lighting plant, etc., at the new Union Iron Works on the Potrero. They will soon have running at these works an electrical railway, the construction of which Mr. Keith is supervising.

He is also engaged in making for a California company a demonstration of the process of electro deposition of copper from solution instead of depositing it by iron as is now done. It is accomplished by electrolysis. This has been done before, and Mr. Keith is simply demonstrating here the practicability of the process. He intends to demonstrate the method of lead refining by electrical action also. The use of electricity in metallurgical processes is rapidly coming to the front. On this coast, however, little has so far been done. The Pacific Coast Electrical Construction Company intend also making mining machinery to be run by electricity, in such places as power can be obtained for the dynamos. Recent improvements admit of the fluid being carried a long distance from sources of supply, and by its means to run mills, pumping machinery, hoisting apparatus, etc. As soon as they are ready they will put up the machinery with a guarantee of its efficiency. There are many places in the mountains where such a plan as this would be of the greatest advantage.

Frank W. Smith, of the Mining and Scientific Press of San Francisco, called at our office on Friday. Mr. Smith will spend a few days taking notes of the progress of Daggett, Calico and the mines, for publication in the able and valuable journal he represents.—*Calico Print, March 1st.*

The Richmond Mining Company at Eureka has closed its furnaces, refinery and mine. This throws about 300 men out of employment. Some 40 miners who have been working on tribute, have also been thrown out of work.

During the month of February the coinage at the San Francisco Mint consisted of 62,000 double eagles and 500,000 standard dollars, or a combined value of $1,740,000 against $1,620,000 for the same month last year.

The contractor for the water works at Golden Gate Park has ordered his material from the East. It seems as if the taxpayers' money might be spent in this city to better advantage than sending it East.

Fresno Mines.

Elsewhere, in this issue, is a sketch of Fresno county's mining interests, from the pen of our representative, Mr Frank W. Smith, now enroute to Arizona and New Mexico. The facts were gathered from reliable sources by our correspondent, and show a deplorable state of affairs to exist in Fresno, as to her greatest and richest industry. Comparatively speaking, the future leading industry of the county is lying dormant and neglected, especially so by her home capital. Facts go to show that money and machinery, only, is necessary to add millions to the county's wealth. Ore, and abundance of it, lies waiting transformation into bullion and coin. Outside capital is stepping in, and ere long, Fresno's great mineral wealth will be in the hands of corporations and capitalists like her lands, which are now owned by colonies and mortgaged to monied institutions. Prosperity and plenty will be the result of the proper development of these mineral fields.

Tailings.

Fresno City is not a mining city.

Careful investment in the mines of the county would pay better than loaning money on long time and low interest.

The resident capitalist of Fresno is overlooking the best paying investments that are open to practical business men of the county, in her rich and undeveloped mines.

When Fresno's mines yield a steady output, money will be plenty and times good.

Development is all that Fresno's mines need to yield thousands.

In April the Mining and Scientific Press representative will visit the mining districts of Fresno county and describe their mines and methods of extracting and treating the output.

Graphite.

Very little mining for graphite is done in this State, though it occurs here in many places. The trouble seems to be that most of our California material is of too low a grade to be profitably mined. The substance is used all over the world for making lead pencils, stove-polish, antifrictional compounds, crucibles, and as a pigment. The Russian and Ceylon product seems to take the lead in quality, and most of that used comes from there. None of very good quality, in any amount, has been found in California. It occurs here among other places, at Gold Springs, Tuolumne county, a mile north of Sonora; near Fort Tejon, Kern county; on the border of Tomales bay; near Summit City, Alpine Co., and at several places in Sonoma, Marin, Plumas and Fresno counties. A late discovery is at Tejunga, 25 miles from Los Angeles and 12 miles from the S. P. R. R. line; another late discovery is at Borer Hill, Fresno county. Works were here established some years since to make crucibles from the California product, but they experienced difficulty in getting a sufficient supply of suitable material.

The Inauguration.

The great event of the week is to be found at the National Capitol. For several days the railways centering in Washington have been put to their utmost to carry the throng going up to witness the inauguration of the new President, Grover Cleveland. It seems that interest in this great national event has been wider and more demonstrative than on any previous inauguration. Preparations to gratify the immense concourse of sight-seers have been commensurately elaborate. Inaugural pageant, inaugural music, inaugural feast and inaugural ball, have all been developed with an expenditure of imagination and of wealth, the like of which the country has never seen before. The wires are resonant with accounts of popular huzzas, stately music and oratory, with the solemn sound of the official oath and the calm declarations of the inaugural address. The day is reported to be beautiful even in the Eastern March—a marked compliment no doubt to the incoming regime.

There are 15 men employed at Cerro Gordo, who are getting out a great deal of ore, all of which is shipped to the Selby Works, San Francisco.

A new mining district has been formed near Bishop Creek. It includes the ground where the recent discoveries were made.

San Joaquin and Sierra Nevada Railway.

We feel a genuine interest in all enterprises which aim to advance regions of the State which are neglected hecause of lack of travel and transportation facilities. The great trunk lines already constructed, open an immense area, it is true, but there is still a greater area which needs local or lateral roads to secure recognition of its real merits, and encourage the development of its resources. The human hody is nourished and restored hy tho great arteries, hut they could not do their work without the capillaries which extend to the uttermost extremities and to the portions lying along the path of the arteries. It is much the same with avenues of travel and transportation. The narrow gauge road comes in as one of the greatest boons of modern engineering for the development and progress of our whole area.

One of the newest enterprises in this line is the San Joaquin and Sierra Nevada Railroad, which is now being pushed vigorously along the path worked out for it. The fine map on this page shows the portion of our State which may properly he called Central California, extending from Monterey and Fresno counties on the south to Mendocino and Butte counties on the north, and from the Pacific Ocean to the Sierras. Just in the center of this region and running almost due east and west may be seen the line of the San Joaquin and Sierra Railway, starting at navigahle water on the Mokelumne river at a new town named Bracks, where the river craft land, and extending eastward through every rich district of San Joaquin county into portions of Calaveras county, and with projected extensious to the Big Trees and to the Yosemite valley.

The western terminal point, Bracks, ahout 15 miles north of Stockton, has first-class terminal facilities. A wharf 500 feet in length reaches out to water 20 feet deep on the Mokelumne, and from this point San Francisco, Sacramento, Stockton, and all other points on the rivers and bays of Central California can be easily reached.

Running eastward the road touches, first, the town of Woodhridge, and then at a distance of 13 miles from Bracks crosses the C. P. R. R. at Lodi, a growing and flourishing town. Here the San Joaquin and Sierra Nevada road connects with the entire railway system of the United States, and thus enjoys the fullest passenger and freight connections. A vast and rich wheat region centers at Lodi, and its productive soil also welcomes many other important productions, such as fruit, hops, melons, etc. The new railway hrings all this produce to deep water, and thus gives the producer the advantage of competing routes for an outlet.

The next town east of Lodi is Lockeford, eight miles distant; then Clements. At this point we reach the lower foothills and hegin to find a change in the soil, though still most excellent in quality and well adapted for vines aud fruit. The road from the station follows up the valley of Bear creek to the towu of Wallace, a distance of six miles, giving at every curve a beautiful glimpse of the Sierras.

From Wallace to Burson, six miles, thcre is an ascent of ahout 300 fect. From here to

Valley Spring,

Distance five miles, which is the present terminus of the road; the ascent is 300 feet, the maximum grade being 116 feet per mile. This is the most romautic and heautiful section of the road as now finished, and it is helieved hy many that the situation of the town of Valley Spring is the most heautiful in the foothill region of the Sierras, and destined to become one of the principal pleasure resorts of the State. The water supply is abundant and excellent, coming from the headwaters of the Mokelumne. The town is well laid out. There are hroad, graded tracts planted with shade trees and with perfect drainage. The location is perfectly sheltered from the north winds. The mildness of the climate and purity of the atmosphere combined with the pleasant surroundings, makes it a favorite resort for pleasure seekers and also for persons suffering from pulmonary complaints.

Valley Spring is reached from San Francisco hy rail in seven hours and a half; from Sacramento in three hours and from Stockton two and a half hours. This, at the present time, is the most desirahle point of departure for the Calaveras grove of big trees, distant 40 miles, hy an excellent road via San Andreas, Altaville and Murphy's, giviug tourists the opportunity of seeing the mining region of Calaveras and of enjoying the grand scenery of the Sierras. Work on the extension of the line from Valley Spring to the Calaveras Big Trees, the proposed eastern terminus, will hegin at an early day.

Calaveras County.

We are glad of an opportunity to call attention to the excellences of Calaveras county, for, though it is a regiou rich in the history of the miniug era of the State, it is too little heard of in the later agricultural period. In another column a correspondent gives some very interesting statements concerning the live stock interests. We regard the county as one of the most promising fields for enterprise and investment and for humble home making. The county has an area of 622,000 acres, of which it is estimated that there are 300,000 acres of U. S. Government land suhject to entry. Here are found some of the hest mines in this State, and the entire county is exceedingly rich in mineral deposits. The baser metals, copper, iron, cinnahar, etc., are found, and ledges of marhle, limestone and granite and undeveloped deposits of coal are known to exist. Several most interesting natural wonders are also to he found here, among which are the world renowned Big Trees; the great cave, with its magnificent chamhers and wonderful stalactites, and the natural hridge also attract the attention and elicit the admiratiou of tourists from all parts of the world. Among its other sources of wealth, Calaveras possesses one of the most valuahle timber belts in the State, live oak, sugar and nut-pine predominating. This county is one of the hest watered sections of the State, and its undeveloped resources are almost inexhaustihle. With the opening which is now made by the new railway, the rapid extensiou of orchard and vineyard and poultry farming, and the huilding up of the indnstries generally of the county, may he expected.

Mr. Henry G. Hanks, State mineralogist of California, made a trip up into Calaveras connty a short time since. In an interview with him last week he stated to a representative of the PRESS that tbe region visited hy him is rich in mineral wealth. He saw some croppings of iron likely to he valuahle near Messenger Valley. There is no mine hut a valuahle prospect. He saw also some fine huilding stone which he helieves will he very valuahle. It is in the same range as that of Mokelumne Hill, and is also near Messenger Valley.

A deposit of chrome iron was also examined, which bids fair to he valuable. Mr. Hanks also saw a hed of lignite which he thinks will he utilized to a large extent. It is, of course, not a high grade coal, hut there is considerahle of it, and it will be of use to that region. It is not developed though a short tunnel has heen run in.

All along the line of this railroad, Mr. Hanks says there is fine clay for hrick making purposes. A good many brick huildings are being put up, and there is an air of enterprise and improvement all along the road. Such roads as this do much to develop the country.

The Campo Seco copper mine is getting out copper and is a good property. It is in a heavy cupriferous belt that here traverses the country. Furnaces were put up here at au early day, and a railroad built connecting them with the mine, which has been opened hy a vertical shaft 275 feet deep, and hy three levels, 80, 140, and 200 feet deep respectively. Mr. C. Berger, Superintendent, says that the vein is well defined in a country of slate; course of vein, northeast and southwest; dip, 62° S. E. In his opinion there is here a large hody of ore that will average ten per cent copper. The hoisting-works are driven hy water communicated hy an ordinary hnrdy wheel at a cost for water of three dollars per day. The ores arc generally chalcopyrite with some hornite and iron pyrites. The reduction works put up here are complete and extensive.

Entered according to an Act of Congress, in the year 1884, with the Librarian of Congress, Washington, D. C.

The Desilverization of Lead by Electrolysis.

(*Continued from page 154.*)

lead, or of all that the extensive plant requires. On the other hand, the declaratina of Mr. Keith that the product of lead is in precise proportion to the number nf amperes, or proportional to the quantity, of current, raises the question at once whether, with a given plant, the rapidity of production may not be increased simply by increasing the quantity of current. If Mr. Keith's works, using a thousand amperes, produce for each vat a ton in ten days, then would it be possible for him, by doubling that quantity of electrical current, to produce double that amount of lead, *i. e.*, treat double the amount of bullion in the same time?

The second objection to this process is also, more or less, an economical one. It is this, that the process furnishes us with pure lead, but it also furnishes us, in the residues, with the worst sort of material for further treatment. I wish to inquire what has been Mr. Keith's experience so far, in the matter of the extraction of gold and silver from the residue. The fact that he gets all the lead, and that he makes it pure or nearly pure, is excellent so far as it goes. Possibly it may be done with such great cheapness and regularity, and so little skilled labor, as to make it compare favorably with the ordinary processes of calcination and desilverization. But, on the other hand, there is the question whether there is loss on the gold or the silver, whether the slag which comes from the crucible in which the nitrate of soda has been used is itself worth anything, and whether we are obliged to follow remnants of gold and silver down through that waste material for further treatment; all of which questions will have to be further considered before we can sum up the advantages or disadvantages which this process, like every other, must possess, and decide upon which side the balance of advantage inclines. I fancy, though I have not had any personal experience of the advantages of the process, that it will turn out, like most other processes of acknowledged merit, to be economical under some conditions and in some localities, whereas in other localities and under other conditions it could not, perhaps, compare economically with the present processes.

Mr. Keith: The impression which I desire to convey is this: That this plant was an experimental one, but

An Experiment Upon a Large Scale.

Every point which we have met has been favorably decided. The question of the separation of the residues to their ultimate constituents has not been fully determined, but the slags which are produced are very fluid ones, and the separation of the gold and silver, as far as our tests have gone, seems to be complete. The chemical separation of antimony has been thoroughly considered, but none yet carried into practical effect. There seems so far to be very little, if anything against it upon theoretical consideration.

As to the economy of plant, considering the amount of material which must be placed under treatment, I will say this, that the process has been carried on at the rate of dissolving these plates in two and half days or sixty hours, and the action was still as effectual as at the slower rate. It may be considered as settled that, with the proper means for the increase of our "quantity," the time could be at least reduced from seven days or one hundred and sixty-eight hours to sixty hours. That decreases the necessary size of the plant for a given output very materially.

It was not thought necessary, in this plant, to go to that extent, but the experiments which have been carried on, and to which no practical objection has been urged by those who are experienced in such matters, settle that point. At the time of the first publication of this process, it was considered hy myself an impracticability to dissolve these plates with a greater rapidity than in about eight days, for this reason: If the solution is not properly circulated, it does not enter the bag and filter through it, so that the sulpbate of lead which is formed within the bag by the electrolytic action can be dissolved by the acetate solution and carried from the bag into contact with the cathode. There would thus be, in the case of an imperfect circulation, a formation of a crust of sulphate of lead, which would not be dissolved, and would interrupt the process. But I am now satisfied that the time can be reduced, as I have said, to sixty hours, without impairing the efficiency of the operation in that way.

Rosewood Trees are found in South America and in the East Indies and neighboring islands. There are half a dozen kinds. The name is not taken from the color of the wood, as is generally supposed, but by reason of a rose-like fragrance which it possesses when first cut. Some of the trees grow so large that planks four feet broad and ten feet in length can be cut from them. These broad planks are principally used to make tops for pianofortes. The rosewood tree is remarkable for its beauty. Such is its value in manufactures as an ornamental wood that some of the forests where it once grew abundantly have now scarcely a single specimen. New plantations have been set out, so that the supply will not be exhausted.

Tucson, A. T., has renewed its contract with the Electric Light Company, and the citizens rejoice thereat.

Useful Information.

Art in Oiling Shoes.

A one-armed bootblack having taken the contract to oil the shoes of a reporter, after the preliminary brushing began by rubbing the leather with a wet cloth. When asked what it was for he explained: "When I began this business," said the operator, pausing a moment to cast an admiring glance at the high, aristocratic arch of the newsgatherer's instep, "I used to keep on rubbing the oil into the leather until a man told me to stop. I thought they'd know when they had enough and I wanted to give satisfaction. Some of my customers complained that the oil soaked through their boots and caturated their socks. I thought perhaps I had been putting on too much oil, but the same fault was found in several cases where I had been more careful. Finally an old shoemaker, whom I knew, came along and I asked him what I ought to do to save my trade. He told me never to oil a shoe until I had wet it first. The reason was that the water would penetrate the leather and, remaining there, keep the oil from soaking through. Besides, the water would soften the leather and open it so that the oil would do the leather more good. My trade has prospered ever since.

Why Kerosene Oil Barrels are Painted. "I was oiling a man up one day, and he asked the same question you did. When I explained the reason, he said that was on the same principle as that of painting kerosene oil barrels. I told him I thought they were painted blue just to look nice. He said it was to prevent the barrel from leaking. During a long voyage or a long journey by rail sometimes half a barrel of oil would leak through the pores of the wood and evaporate. So some sharp fellow began to study some way of preventing such loss. He first painted the barrel blue on the outside, and then filled it with water and allowed it to stand until it had soaked up all it would. Then the oil was put in. The water kept the oil from soaking into the wood, and the paint on the outside kept the water from coming out. He got a patent on his discovery, and now he sits in his office and draws his royalty of one cent on every barrel made to hold kerosene oil for shipment. He's got a mighty soft thing on oil barrels." By this time the master of the art of oiling shoes, having rubbed a quart bottle of neatsfoot oil into the reporter's $15 gaiters, rested from his labors and gracefully accepted the half-dollar which was dropped into his palm.

Waxing Floors.—To wax a floor properly we first clean it with turpentine, so that not a speck of dirt is left either on the surface or imbedded in the exposed pores of the wood. If the wood is rough we sometimes scrape it and give it a coat of shellac to fill the pores. When it is perfectly hard, dry and smooth, we apply the wax in one or two ways, either hard or melted, with turpentine. In the latter it is laid on with a brush, left to dry two or three hours, and is then polished with brushes. The wax used is common beeswax. Here is one of the brushes, very large, flat, and made with very stiff bristles. They cost $4 a pair, and are made large, so that if desired one of them can be fixed under the foot by means of a strap, and the polishing done by wagging the leg to and fro. That way of brushing is employed in dry waxing, which is much the hardest, and requires most vigorous polishing. Dry waxing costs about four times as much as the other, and will last two or three times as long. In either case the wax has to be polished right into the grain of the wood. It will not do to put oil on a waxed floor, as it will render the surface gummy and sticky and nasty. If properly done, oiling makes a floor nice, but is never so good as waxing, and costs nearly as much. Raw linseed oil mixed with turpentine for a drier is used.

New Material for Clothing.—A new material for outside clothing has made its appearance in our shops, says the Boston *Advertiser*. It is called "Puttoo," and is an East India article of homespun which is intended for ordinary use, and from its rough texture is particularly adapted for traveling suits. Most East India wearing apparel which is familiar to Americans, is like the crinkled seersucker, designed for the hottest weather, but "Puttoo" is a fabric which is evidently designed to exclude cold rather than heat. In this connection it may be remarked that Irish poplin is coming into favor again. It is said that a Dublin manufacturer has just produced two superb specimens of the fabric for a prominent society lady of title. One is poppy-colored, and soft and rich as the most delicate silk; the other has a pure white ground, wrought with a dainty pattern of gold work so close in construction as to warrant the name cloth of gold, which has been applied to it.

The Mason Cotton Picker seems to have proven a perfect machine from the start, and that, too, for performing about the most complicated work which has ever been attempted by machinery. It is pronounced scarcely second in importance to the cotton-gin. Commissioners appointed on behalf of the New Orleans Exposition have followed the machine in the field, and record their official opinion that one picker, carefully driven, drawn by one mule and followed by three gleaners, will do the work of forty pairs of human hands. The flying metallic fingers pluck only the full-blown cotton. The plants are uninjured. The fiber thus plucked is automatically bagged.

An Inexpensive Filter.—Very many families desire some inexpensive device for filtering rain and other waters, to be used for cooking and table use. A cheap and very efficient filter may be made by using a spirit of wine cask, placing it on end with the head removed, and having a faucet at the bottom to draw off the clear water. To fit it for the filter, take the removed top head of the cask, and, with a small bit bore holes all over it: then place four clean bricks or blocks of wood on the bottom, and on these rest the perforated top. Now fill upon it about four inches of charcoal chopped into small bits the size of peas; over this put a layer of sand six inches deep. Impure water poured into the cask on the top of the sand will become clear and sparkling after awhile, or as soon as all fine particles are worked out by the charcoal and sand. This filter will not need renewing oftener than once in two or three months.

Use for Spent Tea Leaves.—Save the spent tea leaves for a few days, then steep them in a tin pail or pan for half an hour; strain through a sieve, and use the tea for all varnished paints. It requires very little elbow polish, as the tea acts as a strong detergent, cleansing the paint from all impurities, and making it equal to new. It cleans windows, sashes and oilcloths; indeed, any varnished surface is improved by its application. It washes window panes and mirrors much better than water, and is excellent for cleaning black walnut and looking-glass frames. It will not do to wash unvarnished paints with it.

In Canning Fruit.—It is needless trouble to heat or put the cans in hot water; just set them on a crash towel or any cloth that has been folded double or triple, and dipped into water, and dip the hot fruit into them; of course there must not be a draught of air on them.

Pickles or vinegar will not keep in a jar that has ever had any kind of grease in it.

Never put a hot iron directly upon silk—it takes the life out of it.

Good Health.

Effect of Alcohol on the Human System.

Dr. J. G. Jewell recently delivered a very interesting and instructive lecture on alcoholism in the Young Men's Christian Association Hall in this city. The lecturer, after a brief allusion to the alcohol family including carbolic acid, creosote and caustic, called attention to the fact that $1,500,000,000 was spent each year in the United States for alcohol and tobacco, and but $505,000,000 for bread. Among the adulterations of liquor he mentioned strychnine, a grain and a half of which would produce death. Adulterated liquor was accountable for many a death, but all alcohol, whether drugged or pure, was a man's most determined and deadly enemy. By means of charts, the doctor pointed out the difference between a healthy stomach and that of a toper, the worst being one with cancers in it. He pointed out the peculiar characteristics of alcohol on the human system; called attention to the sudden death among drunkards, and explained that alcohol stopped digestion upon being taken into the stomach, and those addicted to its use became dyspeptic. If a patient dies of delirium tremens, the stomach will be found black from mortification. The corroding effects of drink upon the nerve cells, the muscular fibres and the blood were pointed out, and attention was devoted to the fact that from the use of alcohol the brain becomes intensely red and congested. Some authorities maintained that the brain never recovers from the effects of drink. The brain was so soft that a skull was necessary to keep it in shape and so delicate that the sharpest knife could scarcely cut it without tearing it. Under the effects of drink the brain becomes hardened so as to be distinguished by the surgeon's touch. The brain is literally pickled in alcohol. In alluding to the effects of alcohol upon the heart, he explained that that organ beats 100,000 times a day, and its lifting power is equivalent to 1,036,500 pounds—more than 500 tons—one foot high. Drink caused fatty degeneration of the heart and an enfeebled action. In this condition excitement and exertion often caused death. In a brief allusion to beer, the doctor held that the fat it produced was like suet; it didn't make nerve, muscle or sinew. It made people dull and sluggish. Nursing mothers often thought that it quieted the child, but the child was quiet because it was intoxicated. In conclusion he intimated that the drunkard's disposition and failings were transmitted to his children.

Inhaling the Smoke of Cigarettes.—The inhaling of the smoke of cigarettes has been a common practice, and unless one is graceful in the art they are not considered professional consumers. The London *Medical Times* in commenting upon this subject, says: Of ordinary cigarette smoking we say nothing; we do not believe that smoking a dozen cigarettes a day, in the ordinary way, ever did a grown up person any tangible harm. But inhaling the smoke is a very different thing. Let even the most inveterate smoker try this and he will be convinced. Let him smoke an ordinary Turkish cigaretto while walking, and at some distance from a meal, inhaling the smoke well into the bronchial tubes. Then if, before he has finished his cigarette, he does not find his head grow dizzy, or his heart begin to thump, or his fingers tingle, we shall be quite ready to congratulate him on the possession of an excellent organism. Whether the effect is due to an impression on the termination of the vagus, or whether the active principle of the tobacco is absorbed and carried straight to the heart in the blood current, we shall not undertake to describe; we only describe the fact.

Death-Dealing Dish-Cloths.

"I had some neighbors once—clever, good sort of folks. One fall four of them were sick at one time with typhoid fever. The doctor ordered the vinegar barrels whitewashed, and threw about forty cents worth of carbolic acid into the swill-pail and departed. I went into the kitchen to make gruel. I needed a dish-cloth, and looked about and found several, and such 'rags!' I burned them all and called the daughter of the house to get me a dish-cloth. She looked around on the tables. 'Why,' she said, 'there was about a dozen here this morning;' and she looked in the wood-box and on the mantle-piece, and felt in the dark corner of the cupboard. 'Well,' I said, 'I saw some old, black rotten rags lying around, and I burned them, for there is death in such dish-cloths as these, and you must never use such again.'

"I 'took turns' at nursing that family four weeks, and I believe those dirty dish-cloths were the cause of all that hard work. Therefore, I say to every housekeeper, keep your dish-cloth clean. You may wear your dresses without ironing, your sun-bonnets without elastics, but you must keep your dish-cloths clean. You may only comb your hair on Sundays, you may not wear a collar unless you go from home; but you must wash your dish-cloth. You may only sweep the floor 'when the sign gets right;' the windows don't need washing; you can look out at the door; that spider-web on the front porch don't hurt anything; but, as you love your lives, wash out your dish-cloth. Let the foxtail get ripe in the garden (the seed is a foot deep anyway); let the holes in the heels of your husband's footrags go undarned; let the children' shoes go two Sundays without blacking; let two hens set four weeks on one wooden egg; but do wash your dish-cloths. Eat without a table-cloth; wash your faces and let them dry; do without a curtain for your windows and cake for your tea, but, for heaven's sake, keep your dish cloths clean."—*Western Magazine.*

Effective Cures.

The following are furnished by Mrs. Sarah J. Agnew, Agnew's station, Santa Clara county:

To Prevent Mortification.

Make a poultice of flax-seed. After the same has cooled to about blood heat, mix in, by stirring, one tablespoonful of powdered charcoal and three tablespoonfuls hop yeast. Then spread on part affected. Renew occasionally. This is very effective in drawing out inflammation, and has been known to arrest mortification after the same had set in.

To Put Back or Cure a Felon.

Take unslacked lime and white of egg. Beat together and place on a cloth. Apply to the felon, and change every 10 or 15 minutes for new poultice.

For Sore Eyes.

Take an eggshell broken at one end to let out contents, and fill up with soft water; put in as much white vitriol as could lay on the point of a penknife, a lump of sugar size of a small nutmeg, and a little pinch of salt. Thus filled set the eggshell in hot ashes, until it comes to a boil. Set out and strain and it is ready for use.

The New Anæsthetic.—The new anæsthetic, hydro-clorate of cocoaine, is steadily working its way into more general use in operative surgery. It promises to become quite as great, if not a greater boon to suffering humanity than the original discovery of ether. A very successful operation was recently performed by its aid upon a man's tongue, by Dr. Ree, of Rochester, N. Y. One half of the tongue, which had become seriously affected with cancer, was removed without pain to the patient. The cocoaine was applied to the left side of the tongue and rubbed in, and soon the flesh became insensible to the thrust of a needle, and was as cold as ice, while the right side was in its normal condition. The knife was then applied, and the left side of the tongue was successfully cut away without pain to the patient. Surgeons have thought that the drug would not be useful except in superficial operations.

Onions as a Disinfectant.—A pan of sliced raw onions placed in a room where there is diphtheria will absorb the poison and prevent the disease from spreading. The onions should be buried every morning and fresh ones cut up.

Hartshorn for Stings.—Hartshorn applied to the stings of poisonous insects will allay the pain and stop the swelling, or apply oil of sassafrae, which is better. Bee stings should be treated in this way.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

MIDDLE BAR TUNNEL.—Amador *Ledger*, Feb. 28: This great boring enterprise has now reached a distance of 2,000 ft. Early this week a vein of the same rich, black gold-bearing metal was encountered, proving conclusively that the seams of free gold reaches to great depths. The general character of the quartz shows marked improvement as the header advances north.

SOUTH SPRING HILL.—Everything was in readiness last week to start up the new hoisting machinery, when an annoying blunder was discovered, which will delay matters a couple of weeks. It was found that the reel, instead of holding 1,000 feet of flat wire rope, as the order called for, would only hold a little over 600 ft. The manufacturers sent cable five-eighths of an inch thick instead of three-eighths. It has been shipped back, and the new rope is expected up next week. The roof of the hoisting works has been decorated with a coat of fire-proof paint, and hand grenade fire-extinguishers are kept ready as a precaution against fire. The mine is looking fine. We were shown samples of ore extracted last Monday, in wich free gold was visible in a number of places. The mill is kept running steadily.

KITTERIDGE CLAIM.—This quartz claim situated 2½ miles south of Jackson, on the same ledge as the New York mine, was bonded this week by W. W. Carlile of Ione, and Henry and George Haines of Stockton. The bond runs for three years, and the purchase price is $6,000; $1,000 to be paid as soon as the tunnel now being run into the side hill, reaches 60 ft beyond the shaft, the balance in two yearly installments of $2,500 each. There are two shafts on the property, each about 30 ft deep, disclosing a well defined ledge between 5 and 6 ft wide. There is over 100 tons of ore on the dump. Samples taken from the dump-pile show free gold. The new company intend to enter upon the development of the property immediately. A two stamp mill is to be put up at once to test the milling quality of the ore, and if it proves satisfactory a ten-stamp mill will be erected at onee. Six men will be kept at work at the mine, and work prosecuted day and night. The tunnel now being run into the hill will strike the ledge at the depth of 60 ft from the surface. Good judges of quartz say there is an excellent prospect for the development of a paying mine. The ledge runs parallel with the mother lode. The work of development will be prosecuted under the personal supervision of W. W. Carlile.

MISCELLANEOUS.—The Gover mill is again running on the old dump pile. The Bunker Hill sulphurets works have closed, on account of being out of order. The sulphurets are being shipped to the Drytown works for reduction.

STARTED UP.—Amador *Sentinel*, Feb. 28: The St. Julian mill started up this week. McNamara & Doyle have been awarded the contract to run 100 ft further tunnel for Shugert & Morgan. The Glenn hydraulic mine at Upper Ranchena is now piping in full blast. Another seam of metal ore was struck in the face of the big tunnel Monday, and 200 pounds or more of the rich stuff brought to the surface. The presence of these streaks at the depth which the tunnel taps would almost certainly indieate a continuous ore body from the surface down. The aeeepted theory has been that these black metal deposits were mere freaks and could be found only at the surfaee. The discovery of the past few days go to disprove this, and make it almost certain that the Middle Bar region will ere long have more than one riehly paying mine.

El Dorado.

THE GREENSTONE BELT.—El Dorado *Mt. Democrat*, Feb. 28: On Monday last a *Democrat* reporter visited the mines situated on the Greenstone belt two miles west of El Dorado. These nines are situated in a vast serpentine belt, that commencing in Amador county runs diagonally across this county in a northerly direction. That prospectors have faith in the ultimate value of the mines in this formation, is best attested by the fact that every indication of quartz has been located for a distance of 12 miles. The first mine visited was that of Crane & Elliott. Here we find the deepest shaft that has ever been sunk on the ledge, the northern incline being 300 ft in depth. Fifty feet south the owners have sunk a vertical shaft, 160 ft in depth, and very fine ore is being taken from the 140 ft level in this shaft. The owners intend to resume work in the deeper levels as soon as a new pump is put in the shaft, the old one being inadequate to keep the mine free from water. The owners have very complete machinery, the hoisting works being operated by water power, water being obtained from the Park Canal Company. North of the Crane & Elliott is the present "bonanza" of the belt, the Florence, owned by F. B. Tnek. At this mine a shaft has been sunk to a depth of 70 ft; a drift running north from the bottom of the shaft a distance of 180 ft. The ore that is being taken from this level is of a fabulous richness. Prospects taken promiscously from all parts of the dump going from 25 cents to $10 a pan. The appliances for a successful working of this nine are very complete, the hoisting works (water power), pumps, etc., being of the most approved pattern. It is the attention of the owners to sink a new shaft 100 ft south of the present works, and also construct a mill at an early day. One thousand feet north of the Florence, we come to the Barns mine. This is the pioneer mine of the belt—has been worked for the past eight years, and at a great profit to its owners, Henry Barns. Two shafts have been sunk, an incline 150 ft in depth, and a vertieal shaft 220 ft in depth. It was in this shaft that the recent rich developments were made. The ore on the 200 ft level carrying a large pereentage of tellurium. The hoisting is done with a whim. Like every mine on this belt, the ledge matter for the first 150 ft was soft and easily exeavated. After attaining that depth the ledge becomes hard and compact. North of the Barnes comes the Eureka, owned by Graham Brothers, of Shingle Springs. Very rich ore has been taken from this mine. A well timbered shaft has been sunk to a depth of 125 ft. Nothing is being done, however at the present time. On the Hayes mine, north of the Eureka, a shaft has been sunk to a depth of 40 ft with very flattering prospects. One-half mile west of the Greenstone belt, lies the North Star owned by Sacramento parties. They have a very wide ledge averaging 10 ft. A 40 ft shaft has been sunk, and the owners think they have a big thing.

BLAIR MINE.—Work at the Blair mine, situated in the same belt as the Union, is steadily progressing. Very rich ore is being taken from the lower stopes, and the mill crushing night and day.

AT THE UNION MINE.—Under the superintendency of Jesse Wall, a shaft has been sunk a distance of 164 ft. It is the intention of the owners to continue sinking until a depth of 300 ft has been attained. No crosscutting is being done at present, enough ore has, however, been uncovered to keep the mill crushing for the next five or six months, some of the ore being of a very high grade.

Inyo.

AROUND KEELER.—Inyo *Independent*, Feb. 28: Thomas Boland has 15 men employed at Cerro Gordo. They are getting out a great deal of ore, all of which will be shipped to Selby & Company, San Francisco. Competent judges say that within easy reach of the Hawley mill there are tens of thousands of tons of ore containing $25 per ton in silver and gold, and claim that with proper management it can be worked in the mill at a fair profit. From the Jim mine at Darwin, J. S. Gorman is now getting out ore of good quality; teams are hauling the ore to the furnaee, and a run will be made soon. The Nevada Salt and Borax Company are making an interesting experiment at Keeler. The water of Owens Lake carries a very large percentage of soda in its various combinations, and the aim of the company is to get the soda from the water and use it in making borax. A number of vats are dug in the ground close to the edge of the lake; these vats are 75 feet long and 30 feet wide; water is pumped into them from the lake and kept at a depth of about 18 inches. The daily evaporation is nearly three inches, and the quantity pumped into the vats daily is equal. At the end of six months the vats will be allowed to dry out and the soda will be gathered. The process has not yet been in operation long enough to determine whether it will be a success or not. Mr. James Stansbury is in charge of the work. During a recent visit to Wild Rose district, Mr. Day made an extended examination of the mines there. There are 12 mines now known and partially opened, and all have ore that would be considered high grade, even in the most noted mining districts of the Pacific coast. The ledge now opened runs all the way from three to fifty feet wide; much of the ore runs up into the thousands of dollars per ton; but there is good reason to believe that all now in sight would average at least $60 per ton. This new district promises to be a valuable mining field.

Mariposa.

DILTZ MINE.—Mariposa *Gazette*, Feb. 28: Owing to the searcity of water, which has been materially less than any previous season, Captain Diltz, the proprietor of the mine, has discharged his men and suspended work for the season, except an abundant rain should fall in March. Up to the present he has used the supply of water at his command in the most advantageous manner and which has served a double purpose. Frist in removing the large bank of dirt by running it through a long chain of siuices, which with the aid of quicksilver catches all the fine gold and uncovers specimens of rich float rock, valuable deposits of ore and decomposed quartz which this mine has always been exceedingly favored with. Secondly, the last wash was utilized in such a manner as to uncover some 40 feet of the true fissure which is shaped like the roof of a house and is 25 feet aeross a short distance below the comb of the vein. The Captain considers this to be one of the most remarkable developments yet struck upon the vein. Gold is to be seen all through the work, besides several hundred dollars have been taken from the surface and outcroppings, which goes to prove most conclusively that his last work is on the apex of a rich chimney of ore, on which a shaft will be sunk as soon as he is satisfied the rainy season is past. Some beautiful specimens of coarse gold are frequently picked up from the wash of this mine. Notwithstanding the mine possesses an independence for its owner outside of the main vein from which thousands of tons of ore and rock have been taken and piled up with a view to grinding in a mill.

SWEET WATER.—The works at the Groves' mill and mine, which is bonded to a company was to have started up this week. Everything is said to be in fine order and with a quantity of good ore in sight everything bids fair of suceess about the mine. The Ferguson mine owned by Jimmy Ferguson is one of the best in the county. It has a new eight-stamp mill complete in all its parts, with a vein of quartz that will yield a fair average to the ton, and will be a permanent institution.

Mono.

THE BODIE CON.—Bodie *Univer*, Mar. 2: At the mine the north drift 300 foot level is in 97 feet. The south drift 500 foot level is in 88 feet. The south upraise 500 foot level is up 110 feet. The joint upraise 550 foot level is up 188 feet. We started the mill to-day. Twenty-nine men employed.

THE MONO.—The Mono south drift is in 85 feet, an east crosscut from it is in 15 feet. Upraise No. 2 from drift 30 feet above the 550 foot level is up 13 feet, we find bunches of good ore in it. The joint upraise 550 foot level is up 188 feet. Eight miners were employed.

THE CON. PACIFIC.—Since last report Pacific ledge No. 1 has been advaneed to a total distance of 229 feet from chute. During the week we have cut into an entirely different formation from any heretofore encountered in the drift. It is identical with that cut in all approaches to the Fortuna vein, and is filled with seams and bunches of fine looking ore which becomes more numerous and better defined as we advance. We are strongly encouraged to hope we will very soon cut into something of importance. In the crossent to cut Pacific No. 2 weare also much encouraged. We find the ground strongly mineralized and more kindly as we approach the vein. The presence of small stringers or feeders at short intervals we regard as a very favorable indication.

Nevada.

MOUNTAINEER.—Nevada *Transcript*, Feb. 28: John Snyder, late of San Jose and one of the principal owners of the Mountaineer mine at this city, has succeeded H. G. Battey as superintendent of that property. Fifteen of the 20 stamps in the mill (which is equipped with six Frue eoncentrators) are being run night and day, the other five being used from time to time on the highest grade of ore taken out. Last Sunday a five foot ledge of excellent quartz was developed in the 300 level, and this in connection with the former developments makes the mine one of the most promising in the county. It has for some time been a regular dividend payer. The bulk of the stock is held by four residents of San Jose. The average thickness of the ledge of the Neversweat mine, Willow valley, is two and a half feet, with a streak of from six to eight inches of exceedingly rich ore running through it. O. Maltman has purchased three tons of this, paying $140 a ton for it on the dump. The Constitution has a four-foot vein carrying a 15-inch ledge from which assays have given as high as $1,500 a ton. It is estimated that 15 inches will mill something like $200 a ton. The Constitution is on Deer creek above the Deadwood and on the same bank. It is reported that the Derbec drift mining company will soon substitute water power for steam in running the machinery. If such a step is taken their expenses will be materially reduced and the mine again placed on a dividend paying basis. This company pays out enough every year for wood for a few dividends to stockholders. If tbey had had water power during the past five years it would have made a big difference to the stockholders. The new mill at the Eagle Bird mine, Washington, which was made at Allan's foundry in this city, is running regularly and in the most satisfactory manner. The mine looks better and better with every stroke of work done. The ledge has widened to 15½ feet, and every ounce of the ore pays for working. There are plenty more claims in that part of the county which will be just as valuable as the Eagle Bird when they have been as much developed. John Hippert came down Tuesday to purchase another pump for his mine—the Rocky Glen—near Graniteville, the present pump not being of sufficient capaeity. The Rocky Glen is producing well regularly, being one of the best claims in that part of the county for the amount of labor and capital expended on it.

WASHINGTON.—Cor. Nevada *Transcript*, Feb. 28: The Walters mine is situated a few hundred feet to the east of the Eagle Bird mine and the highest up the river of any mine that is yet opened in this district. The owner has run a tunnel from the south bank of the river quite a distance into the mountain and is yet driving it ahead, as I am informed, with good encouragement. He has no machinery on his mine yet for crushing his ore. He has quite a large pile of ore on the dump ready for milling. We will now cross the north and adjoining the Eagle Bird mine, to the Blue Bell and Sunset mines, both owned by one company. They have opened on their mines in several plaees and have found high-grade ore in every opening with the exception of one. They have one of the finest loeations for free water and a mill plant there is on the river. They have been working as their means would permit for several years, getting their mines well prospected before going to the expense of costly machinery. One of the owners has built a house and blacksmith shop on the mines and is preparing to erect crushing machinery on one of their lodes this coming season. He has his dam and aqueduct in and water running through ready for hydraulic pipe to drive machinery with, and is now with the Champion Lode company building a road from Fall creek on the north side of the river to intersect with the Yuba company's road at a point near the Cornucopia and Secret Treasure mill. This road will be an opening to get in supplies to each of the four mines that are getting ready for machinery. We will now cross Fall creek and on the same side of the river and in the same direction and adjacent to the Blue Bell mine is the extension of the Champion Lode, owned by John Grissel and Wilson Foster. They also have good prospects ahead for the amount of work done on the lode. The Old Champion is the connecting link between the extension and the Lindsay mine. The Old Champion (or Governor Morton, as it is now called) has been opened for several years and of late years only had assessment work done on it until this winter, when it changed hands and they are now starting a tunnel a few hundred feet below the old one. It is opening in on ore showing well in free gold, sulphurets and galena. Here, too, we expect to hear the pounding of stamps before the summer is past. We will not go way up on top of the mountain this time to see what neighbors Bell and Greathouse and others are doing, but we will keep elose to the river. We have no more prospecting going on now on the north bank of the river until we get to the Cornucopia and Secret Treasure, which works and mines you gave a diseription of a short time ago. They are taking out of a shaft near the mill as nice ore as we have seen for many a day. It is spotted all over with gold. Next we come to is the south end of the Champion Extension where it crosses the river and runs into the mountain on the south side of the river. Next we come to is the Crœsus mine situated on the east side of the old and well known Yuba mine. The Crœsus has lately been opened in two different places on the lode and they found a vein varying from one and a half to six feet thick, showing well in free gold, galena and sulphurets. This mine, as well as the other ones mentioned, has the advantage of great water pressure. They have from 180 to 1,500 head, and most of them can be worked for a life time without sinking or having to pump, which is a great saving. It is a mistaken idea that many have that the mines here are high up in the mountains. Those just mentioned are only about six hundred feet higher than Nevada City, and I think it is not any colder here than with you.

MINING MACHINERY.—Nevada *Transcript*, March 2: Four tons of machinery for the Delhi quartz mine near Columbia Hill has arrived here by rail. It consists of feeding, eoncentrating and other apparatus required to fit the mill up in first-rate shape. The Delhi is owned by Judge Searls, R. McMurray and others, and is believed to be a very valuable property.

A BIG CLEAN-UP.—An immense clean-up (the first general one since the new mill was erected) has just been made at the Eagle Bird mine, Washington. The bullion was taken below *via* Emigrant Gap. The Eagle Bird ledge is 16 feet thick.

Plumas.

PREMIUM NO. 2.—Plumas *National*, Feb. 28: A great deal of interest is manifested in the recent development made by Mr. Hallack in his quartz mine, near Taylorville. The peculiar character of the ore, in connection with its extraordinary yield, has excited much interest and surprise among the quartz mining class. From what we learn, Mr. H. has been for several days engaged in milling rock that will yield $100 per ton. The outlook is very promising. This development has been made in the immediate vicinity of the old Premium mine, some three miles below Taylorville. At present the owner has engaged the use of the five-stamp mill of the Young Brothers. From all we can learn, a new era is about to dawn in that section in quartz mining. Three thousand dollars yield from 23 tons will do very well for a starter.

EAST BRANCH.—The weather is fine and everybody busy at work, with good prospects. Hallsted & Hard are piping on Dingbat with a good head of water, and will undoubtedly make a good clean-up. C. R. Hallsted is still on the coarse gold lead, and doing well. Frank Jackson is ready to run, soon as water starts; also Mrs. Hyde's claims at 12 Mile Bar is ready and waiting for the spring run, but the outlook for a good water season is rather poor, there being no snow on the mountains. A. H. Brooks is getting out some good quartz, that shows plenty of the "filthy lucre." Fred Lewis' claim on Rich gulch, is on top now in the way of rich prospects. He is piping the surface with what water he catches in the reservoirs, and prospects quartz while they are filling up. It is reported that he has rock that pays from $1 to $2 per pound. McPherson has commenced operations on the Deadwood side of the ridge, with good prospects. We expect to see things hum on Rich gulch this summer.

COPPER MINE.—Greenville *Bulletin*, Feb. 28: While in Taylorville, we were informed that arrangements are nearly completed whereby a 30-ton Water Jacket furnace will be erected on the Engles Copper claim during the coming summer. The ledge is now 50 feet wide, and it is believed to be a good quality of ore. We hope that the owners shall be able to construct the furnace and that they will realize a handsome profit from the mine. The success of this enterprise is of great importance to this section. It may lead to the construetion of several other furnaces on the mine, as there is an immense body of ore for reduction.

ARGENTINE MINE.—Plumas *National*, Feb. 28: This mine is situated about 12 miles from Quiney, and is very favorably loeated for cheap milling, there being a good water power, and plenty of timber convenient to the mine. It is owned by C. Lee & Sons and Mrs. Edwards. Mr. James Thompson, an experienced miner and amalgamator, is superintendent, and from his success in making it pay, evidently understands his business. The second clean-up was made last week of $458 from 100 tons of rock. As the cost of milling is about $2 per ton, there is a handsome margin left for the lucky owners.

San Bernardino.

LONE STAR.—Calico *Print*, Mar. 1: From A. G. Rhodes we learned that his Lone Star group of mines in West Calieo are looking well. Work on the Lone Star has seen progressing for several months. The shaft is down 70 feet, the tunnel in 100 feet. The main ledge is well-defined, runs north and south and dips east. A large vein on the west of the main ledge dips east, and over a dozen on the east dip west, which no doubt converge to the main ledge. Almost 20 tons of good ore have been taken to the mill. 12 tons to Barker's and the rest to Waterman's. The ore can be hauled direct to Waterman's by the new road made to the mines on the west. Messrs. Evans & Tait are interested in the output of the mine, and Mr. Raymond owns a one-sixth interest in the claims. There are four companies of chloriders at work on the mine, consisting of eight men. We were shown a solid chunk of ore weighing 260 pounds, which assayed about $1,000 to the ton. Immense bodies of low grade ore that will pay to mill exist in this group and enough high grade can be taken out daily to operate the mine with a profit. It is reported in Calico that C. J. Perkins has bought the Big Horn Adder mine in West Calico. Consideration about $5,000.

Sierra.

CLEANED UP.—Mt. *Messenger*, Feb. 28: The Bald Mt. Extension Co., at Forest City, cleaned up 86 ounces last Sunday. The working force was increased this week. Red Oak Co. are now in soft picking slate bedrock with a favorable prospect of soon reaching pay gravel. The bevel gears for Mr. Hill's arastra are nearly done, and the work of crushing will be resumed on Monday. Jerome York finds no difficulty in getting rock enough to keep the Slug Canyon mill running night and day. Marguerite Co. have their shaft nearly drained, and the machinery will be started in a few days. York & Tschanis (pronounced Johns) have struck the ledge in the extension of the Slug Canyon, and find the rock good, gold being visible to the naked eye in much of it.

Siskiyou.

PICK AND PAN.—Yreka *Union*, Feb. 26: John Wagoner found a $54.50 nugget in Printy gulch a few days since. There is an abundance of water for mining purposes in the Deadwood district. The proprietors of the Mott claim on Klamath river are getting out timbers for wing-damming. Miners in the Cottonwood district report a scarcity of water, and it is believed that little mining in that section will be done this season. Louis Davis & Sons on the divide between Hiyou gulch and Deadwood, are working a ledge that prospects well, and expect to make a good cleanup. McNeal & McLaughlin, near Oliver's Flat, on Salmon river, cleaned up $500 from a 6 ft sluice at the head of the spring one day last week. The river miners on the Klamath are busily engaged in making such improvements as the condition of the river will permit, preparatory to getting an early start when the waters fall sufficiently. Many people appear to be unaware of the fact that a number of the richest New River discoveries extend over into Siskiyou county. Prospectors agree that the best field for prospecting lies within the borders of this county, just over the Trinity line. The Montezuma placer mine at Callahan opened for the season Sunday with a force of 15 men under the superintendency of Mr. James B. Parker, who successfully worked the claim last year. This mine is one of the most profitable and best equipped in the county. The two Portuguese companies on Cherry creek are running full time, with a good head of water, and are working in good ground. Each company has a splendid 3 ft flume, and their water supply is obtained from two reservoirs, which they use alternately. Tucker & Co., below the junction of the east and west forks of Deadwood, have crushed with their 5-stamp mill upwards of 150 tons of rock since they started. Their rock has paid well in former seasons.

and there is every indication that the richness of the ledge has improved. They will clean up in two weeks. Messrs. George Smith, R. H. Campbell and George C. Spooner, owners of the Summerville hydraulic mine on the south fork of Salmon, have in their employ 40 men. Twenty-seven of the number are engaged in constructing their 4-mile ditch, and the remainder are employed in the sawmill and mine. The Humming Bird ledge, located a little above the conjunction of the east and west forks of Deadwood, and owned by Messrs. C. H. Pyle & McCook, is being rapidly developed, and is considered to be a paying discovery. Two tunnels, each over 200 ft in length, have been driven, and the permanency of the ledge is established. Their arastra has been running for some time and a cleanup will shortly be made. The assayer's certificate shows that the rock goes $80 to the ton in gold and 50 in silver. It is no longer a matter of doubt that the New River discoveries will prove of more benefit to Siskiyou than to Humboldt and Trinity counties. Already large orders for grain, bacon and vegetables have been received by our merchants and producers, and pack trains are spoken for many trips in advance after the packing season opens. Trinity county cannot produce sufficient for her consumption, and Humboldt is but little better, consequently the New River trade must fall to us. Our location, superiority of prducts and low prices make Siskiyou the natural market for the New River section.

Tuolumne.

A RICH STRIKE.—*Union Democrat*, Feb. 28: Mike Shine and Dave Oliver have struck it big in the old Patterson claim on Bald mountain, which they have been working on a lease from Ed. Garrett. Last Saturday they began to find gold and ever since have been taking it out by the fist full. Wednesday they took out a chunk weighing 15 pounds almost pure gold. The extent of the find is as yet unknown as the boys are somewhat close-mouthed in relation to their strike, but it is certain that they have taken many thousand dollars in the past week. The lowest estimate place the sum at $10,000, while others raise it to several times that amount. It is hardly possible that the boys themselves know with any exactitude how much they have got, as they have not got the "pocket" cleaned up. They have four mortars going, pounding up the quartz. It is said that there is still gold in sight in the mine. David Hunt, who has taken a six months working bond on the Maryatt mine, at Tuttletown, will commence operations next week. He has let a contract to Sam Hoskins to clear the mine of water. As soon as this is done Mr. Hunt will proceed to sink the shaft, which is now down 104 feet, to a depth of 200 feet. He will also run levels and thoroughly prospect the mine, and at the same time make a thorough working test of the ore. All up around Confidence the ground is perfectly bare of snow, and the roads are dry and dusty, something remarkable for this season of the year. Up towards the summit there is but little snow, and if there is not a heavy fall before spring the streams will be very low this summer. It's likely, however, that there will be some heavy storms in the next few weeks.

Trinity.

TO NEW RIVER DISTRICT.—Trinity *Journal*, Feb. 28: John Adams was in town this week from North Fork, having returned from a trip to the New River mines only a few days ago. He took in a couple of passengers, having a train of three saddle and two pack animals in all. The trip was easily made from North Fork to Rattlesnake the first day and from there to the mines the day following, and it was easy to return in two day. He says a very little work in "brushing out" will make a trail from Rattlesnake to the mines, the distance being about 15 miles.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, Feb. 28: They are in eight feet on cross-cut No. 2, 2900 level, and all in good ore, some of it being very rich. On the 2800 level, at the point above where they are now at work on the 2900 level, they ran through 45 feet of quartz before getting ore, which seems to indicate a large deposit. On the 3000 level they are cutting out a chute for dumping the rock and ore from the 2900 level, which at present is being stowed in the drifts.

OPHIR.—They are working the north lateral drift on the 500 level and will continue through the Mexican and Union ground.

YELLOW JACKET.—They are still working on the old upper levels and extracting a large quantity of low-grade ore.

GOULD AND CURRY.—Explorations are being made on the 1000 level of the Bonner shaft in ground never before prospected.

CROWN POINT.—The usual amount of low-grade ore is being taken out and shipped to the mills.

SAVAGE.—On the upper tunnel they are cutting good quartz.

CHOLLAR.—They are running a south drift on the 3000 level.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Feb. 28. The west drift on the sixth level is now in 146 feet, and the south cross-cut from this drift is in 30 feet. The west drift on the fifth level has advanced 12 feet during the week and the face is showing a little low-grade ore. The intermediate drift, between the fourth and fifth levels, has connected with raise from the fifth level. This drift is now being extended westerly and the face shows two feet of $100 ore. The stope near the foot of the raise from fifth level shows two feet of $50 ore. The stopes near winze No. 2, between the fourth and fifth levels, are yielding some $60 ore and look promising. The intermediate stope, between the third and fourth levels and east of the shaft, is yielding some $100 ore. The intermediate stope between the second and third levels and west of the shaft, is yielding a number of tons of $50 ore daily. A small amount of $80 ore is being extracted from the east drift on the second level. The intermediate stopes, between the first and second levels, are yielding a small amount of high-grade ore. A bullion shipment of $9,221.36 was made on the 22d instant.

Eureka District.

WILL CLOSE DOWN.—Eureka *Sentinel*, Feb. 28: With the exception of the refinery, all work at the Richmond furnaces will to-day be temporarily suspended. Just how long the suspension will continue it is hard to say. It may be for 90 days. Work at the refinery will continue until the crude bullion on hand is worked up, which will be in the course of ten days, when work there will also cease for an indefinite period. The cause of the suspension of operations is assigned to the condition of the roads and to a necessary overhauling of the machinery. It will throw upwards of 160 men out of employment temporarily.

Pioche District.

LEACHING.—Pioche *Record*, Feb. 28: There are being daily put through the leaching tubs at Bullionville 16 tons of tailings to each tub. The Company is putting up four more tubs, that will make ten in all, with a capacity to work 175 tons of tailings per day. The tailings are now dumped into the tubs as they are taken from the pit, through large chutes in the roof of the building instead of being put through the agitator, as was formerly done. This saves both time and expense. The company's tramway is running smoothly, and if they had had such a contrivance during the three years that they were smelting the Magnet and Raymond & Ely tailings it would have saved them thousands of dollars.

Reese River District.

AUSTIN STILL ALIVE.—Virginia *Enterprise*, Feb. 28: The Manhattan Company at Austin, Lander county, is putting machinery on the old Union shaft, which is 200 feet deep, and has been idle for many years. This will be cleaned out and repaired and sunk deeper. Powerful machinery is to be erected upon these works, and the business of prospecting this new country will be energetically pushed. Ever since the famous Whitlatch ledge was lost, that particular section has been looked upon with much interest, and now the company will prospect for it or any other ledge which may be shown up.

Taylor District.

TWO THOUSAND A DAY.—Taylor *Reflex*, Feb. 28: John Devlin and Mac. McLaughlin have struck it big in the ground leased from the Monitor Mining Company. They took out yesterday morning $1,000 worth of ore and the prospects were good for taking out another thousand before six o'clock. The ore taken out goes from $500 to $1,000 per ton. The ore body is about 12 feet from roof to floor, and good milling ore, two feet of which goes from $500 to $1,000 to the ton. In places the pick can be sent in up to the eye in clean chloride. The development in this piece of ground goes to show that this country is not half prospected yet.

Willow Creek District.

THE WILD DEER MINE.—*Silver State*, Feb. 28: John McGrath, assayer at Willow creek, arrived here Saturday on the way to Eureka. He says the Wild Deer mine, owned by H. H. McColly and R. McLeran, is proving to be very valuable. There is a drift 150 feet long on the lead, which is now five feet wide and assays about $50 per ton. This lead is a true fissure vein well defined and sufficiently developed to warrant the assertion that it is a good mine.

ARIZONA.

GOLD IN COPPER BASIN.—Arizona *Miner*, March 1: Uncle Ike Bradshaw, who came over yesterday from Copper Basin, brought with him a large boulder permeated with gold from a new find in the Basin. The ore assays $50 to the ton and is highly impregnated with iron. This ore can be worked with copper ores by smelter process and copper matte be made very valuable, for the gold that may be infused into it by mixing the ores. The fact is, Col. Bean does not know what he has got in Copper Basin. It is beyond the comprehension of man.

COLORADO.

GENERAL NOTES.—Georgetown *Courier*, Feb. 28: The Pay Rock mill has been receiving some new machinery. The Freeland is reported to be producing 40 tons of ore per day. A mill-run from the Duncan lode last Tuesday returned 310 ozs. silver to the ton. Six tons of ore were brought down from the Scotia last Saturday, which returned well in silver and lead. C. Koontze, of Empire, purchased a quarter interest in the Windsor lode last week, from John Husted of this place. Some nice shipments were made from the Corry City this week, the ore running from 160 to 200 ozs. silver per ton. Some excellent ore is being produced from the Orient, on Red Elephant Mt., the first class of which mills 1,700 ounces. A good streak of ore is being worked in the Eldorado, a new discovery on Leavenworth Mt., by Gus Williams and Sam Worthington. A party of three are leasing on the Charter Oak, Cascade Creek, and have an excellent pay vein. Their last mill-run returned them $125 per month to the man, above expenses. Snow is reported to be four feet deep on a level in the timbered portion of Ute Creek. Notwithstanding this fact, there is said to be more men in camp than for sixteen years. S. Phillips & Co. are driving west from the bottom of the Frostberg shaft on the Dunderberg, and have several inches of good ore. A recent shipment of 153 sacks returned 25 ozs. silver and 51 per cent lead. Fillius & Talley have the water extracted from the Phœnix shaft on the Maine mine, and there is a streak of good ore in sight.

THE SNOWDRIFT.—At the Snowdrift nearly all the available ground has been leased to good miners. About 50 men in all are now at work, leasing and on day's pay. The plan of development instituted some two years ago by Maj. Fulton, which changed the mine from long leanness into rattling good pay, is still being pursued under the same management, with most promising results. As an evidence of the miners' faith in the property, may be cited a single instance of lessees, who, having the option, decided, after drifting 50 feet, to drift 50 feet further before doing any stoping, in order to secure a 100-foot block of ground. A recent mill-run gave 295 ozs. while near this ground black sulphuret dirt, worth about 500 ozs., has been struck. The Peterson shaft is being sunk a second 70 feet below the tunnel, at the rate of over a foot a day. It has thus far gone down 15 feet on a good pay-streak. The new hoister is kept busy night and day keeping the shaft and drifts clear of broken rock.

IDAHO.

CLIFF TAILINGS.—Cor. Houston *Press*, Feb. 27: The Superior mine, owned by Owens and Hall is constantly improving and bids fair to become one of the leading feeders toward the growth and prosperity of your snug little town. The veins of ore matter are increasing in size and richness every foot that the miners go down. The main ledge is five feet wide, solid ore and of high grade. There are some 40 or 50 tons now on the dump. The deepest shaft is down 30 feet, all in ore. Work will be begun on the Alice sometime next week and will be continued indefinitely. Messrs. Lamb & Co. will get in a lot of supplies for the Alice mine as soon as possible. They contemplate sinking a shaft 60 feet and the running of a tunnel 150 feet before spring. The tunnel will be run to cross-cut the ledge. This mine carries a good, strong vein of high grade ore, mostly galena. Judge E. Francis Gray is visiting the numerous mines and prospects of Alder district with a view of reporting on them at an early day. You will probably receive some interesting mining news from him soon. The snow is rapidly disappearing, and prospectors are beginning to outfit for another season's campaign.

MONTANA.

INDEPENDENCE DISTRICT.—*Butte Miner*, Feb. 25: The Snow Drift and Silver Lick, adjoining the Margaret Ann lode on the north and west have been bonded to a California company for $45,000. The Silver Lick is owned by James Brogan, Frank Shovelin and James McQuillan. The Snow Drift is owned by "Billy" Wilson, Robert McMinn and John Branagan. The Snow Drift has a shaft 140 feet deep and levels have been run east and west 150 feet on a 3 foot vein of 40 ounce ore. The proximity of these two lodes to the Margaret Ann, which is considered one of the most valuable in this camp, makes them important. The trend of the adjoining lead shows conclusively that the purchasers, or their agents are experts, else they would not have figured so closely on the geological formation. The Snow Drift vein contains per-oxide of manganese, with black sulphurets and chlorides of silver. The ore is free milling above water level. The Silver Lick ore contains manganese, pyrites of iron, sulphurets and flecks of ruby silver.

THE HOPE.—This mine lies west of and adjoins the Anselmo. The owners, Robert McMinn, Wm. T. Boardman, John Leggat and Wm. T. Stevens, are negotiating a bond of $60,000. The vein is from three to ten feet in width and goes from 40 to 1,500 ounces in silver. The ore contains sulphurets of silver, argentiferous gray copper and mispickle, with hornblend and calcspar on the foot wall. The ore is free milling and contains rich bodies of silver glance.

BLUEBIRD.—Superintendent Fleming has a force of men at work on the 150 foot level. They are extracting about 30 tons of 50-ounce ore per day from the old shaft. The vein has been crosscut about 22 feet and, so far, no foot wall discovered. In the tunnel of the Bluebird, stoping is going on with regularity and about 20 tons per day coming from the vein. This ore gives assay valuation of from 50 to 60 ounces in silver. In the new Amy shaft the workmen are down 140 feet and are crosscutting from bottom of shaft, south to tap the main vein.

THE CHAMPION.—Work is going on in the east level on very rich ore. Work on this level (the 140) has been commenced with a view of continuing for 100 feet or more, before starting in another direction. The vein is about four feet in width, and carries a considerable amount of silver, some gold and manganese, the entire body averaging from 53 to 65 dollars per ton in silver, and from four to ten dollars in gold. The ore is being hoisted regularly, and is shipped to the Moulton for reduction. The Champion lays in one of the best mining districts, near Butte, and is but a little way north of the Bluebird and Little Darling. In this mine a new body of ore has been lately reached. In drifting on the main vein a 20-foot horse was encountered, cut and exhausted. The ore body beyond proved richer than that previously encountered. The work is being driven rapidly. The company now propose to sink the shaft 100 feet deeper, and from that point run drifts and crosscuts. Ninety-one tons (the last shipment to the Moulton) gave battery assays of $46.50 ounces in silver, with about $7 in gold. The ore daily taken from this mine more than pays all expenses. Considering the fact that continual new improvements are being made this is something remarkable. The ore is sent to Moulton and Colorado for treatment. In this district other mining properties are looming up. Many owners of different claims are putting their prospects in order, erecting whims, hoisting works and making preparations for general development. Just underneath the Bluebird, on the flat, or rather in the gulch, stands the little town of Burlington, the head center of Independence district.

NEW MEXICO.

NOTES.—Silver City *Enterprise*, Feb. 26: The Arizona Copper company at Chiton is buying copper ores and giving the best price possible for them. For the four weeks ending February 7, the Carlisle company shipped $23,000 in gold bricks. This besides the concentrates is a good showing for the first month in the year. Sam Eckstine recently did his assessment on the Mule mine at Pinos Altos, and from fourteen tons of ore taken out he received $80 in gold and the concentrates are worth $33.50. Sam has commenced work on the Thicket group of mines, near Bear mountain. A party of prospectors, backed by Leadville capital, will start for the country east of the Oregon mountains, to a district believed to be rich in placer gold and formerly worked by the Jesuit Fathers. The only drawback to that section heretofore is lack of water, which is about twenty-five miles distant. The party intends to prosecute work with a dry process as well as with water. Two car loads of ore was shipped last week from Kingston to Denver. One car came out of the Black Colt and the other from the Lady Franklin, both mines being new producers, this being their first shipment. The Lady Franklin, which lies close to the Superior and Bullion, promises to be a regular producer and a paying property for her owners. The mines of Kingston are being steadily developed, and as a general proposition the result is quite satisfactory to the owners. Messrs. Lewis, Colquhoun and Rich have purchased the Silver King mine at Bald mountain, formerly owned by George Parker. This claim has been under bond for some time, and during that time has been developed enough to satisfy purchasers that it is a promising and valuable prospect. From fifty-seven sample assays recently made an average of $477 was obtained. The gentlemen interested propose continuing development work and sdipping the ore. They have a good thing. The Benson smelter company are taking out about ten tons of iron ore per day from their mine near Santa Rita. Messrs. McFarland and Alpho have the contract for doing the mining, while Bragaw & Co. haul the ore from the mine to Whitewater, from whence it is shipped by rail to Benson. When the anticipated improvements are made upon the roads between this point and Georgetown, and the gauge of the road widened, the ore from this property will probably be shipped from Silver City. Mr. Thomas J. Levy was in town this week and imparted to us some very hopeful tidings concerning the Carlisle district. He informs us that he has undoubtedly made a rich discovery on the Pilgrim mine, owned by himself and Frank and Fred Walls. This claim is on the Carlisle ledge and is an extension of the Pennsylvania mine. He and his associates sank a shaft of over 40 feet and ran a tunnel about the same distance to meet the ore body. The result developed a vein of fully 7 feet wide with well-defined wall rocks. This vein contains 5 feet of solid ore, with a foot of gangue and one foot of quartz—the latter bearing mineral of a low grade. The average of the ore in richness is double that of the Carlisle company mine. Mr. Levy says that he and his partners intend to work their claim vigorously and ship the ore. He also informs us that some very good ore has been struck on the Pennsylvania mine. It is his belief that the Carlisle camp will boom up very shortly as the richest mining district in the country.

OREGON.

PLACER MINES.—*Jacksonville Times*, Feb. 28: More rain is wanted by the miners. The miners of Josephine county are making the best of an abundant supply of water. Most of them will do well.

Charles Sanders of Galice creek was in Jacksonville this week. He says the miners of that section have an abundance of water. Keaton & Klippel of Poorman's creek have a good supply of water and are piping regularly. They expect to make a good run. The Centennial Mining Company of Willow Springs are busily at work drifting and are doing considerable work, with excellent prospects. Jack Layton of Farris gulch has an excellent supply of water and will make a paying run. He has one of the best claims in Southern Oregon. The Enterprise Mining Company of this place solicits bids for completing a shaft on their mining property recently begun by S. Bailey and F. Cimborsky. Hays & Magruder's claims on Rogue river are being run on full time and prospect excellently. The proprietors expect to open the claim thoroughly this season.

UTAH.

REVIEW.—Salt Lake *Tribune*, Feb. 27: The week has been quiet, and the mud deep, all indications favoring the idea that the winter break-up has begun, and that spring is coming on apace. No ore and bullion shipments from the city are reported for the week. The receipts of the metals have been very light. For the week ending February 25th, inclusive, the banks of this city report the receipt of $44,907 in bullion, and $11,038.04 in ore; a total of $55,942.04. For the week previous the receipts were $04,697.29, being $49,503.50 of bullion and $15,193.79 of ore. The receipts from the Ontario for the week were forty-eight bars of bullion, of the value of $31,967.00, being a total for the year of $244,575.87. The receipts from Silver Reef were as follows: From the Christy, two bars of silver, $3,200; from the Stormont, one bar, $2,100; a total of $5,300. Ore receipts were as follows: From Utah—Eureka, $5,050; Crescent, $3,300; total, $8,390. Wood River—Mayflower, $1,710; miscellaneous, $938; total, $2,648.

SILVER REEF.—Southern Utah *Times*, Feb. 28: The Christy Company is working at present five different claims, which are producing sufficient ore to keep a five-stamp mill in active opeartion night and day—crushing, on an average, 45 tons every 24 hours. The main supply of ore is now being furnished by the California and Maggie mines. The California is located on the ledge proper, taking in 1,300 feet of the vein. The Maggie is a side claim, adjoining the California on the east. The ore from this claim lies near the surface, where a portion of the ledge crops out near the California east side line. The main working shaft is an incline situated 600 feet from the north end line. A drift run north at the 400 foot level, which connects with an incline shaft on the north end of the property. It was around this shaft that the great bulk of ore was formerly extracted. Only about one-third of the ground was explored. A block of ground extending north from the main shaft 300 feet and 300 feet in hight from the 400 level is now being opened up. There has been several large chimneys and pockets of ore opened up in this portion of the mine, with every indication that the ground will pan out as well as that immedietely adjoining the north shaft. The north shaft was sunk over 500 feet, with ore in the bottom, when the mines were closed. It is not being worked below the 400 level at present, on account of water. Since the company began operations last August, much prospecting has been done in the mine. From the appearance of stopes and all indications, we think there is not a doubt but that the mill could be kept running for two years on ore in the northern part of the mine; and judging from the work already done, and the developments made in the surrounding claims, the southern 700 feet will, when properly opened up, produce as much as the northern part of the mine. The other claims worked by the Christy Company are the Storm King, Tecumseh and Silver Flat. These claims adjoin each other, and are situated on the Buckeye Reef, about a quarter of a mile from town. The working shaft, generally known as the New Shaft, is sunk vertically to a depth of 380 feet. This new shaft and hoisting works cost the Company a large amount of money, and was one of the causes which made a temporary suspension of work on the mines necessary. The properties are being opened by winzes, drifts, etc. There is considerable ore in sight in the stopes, and when in proper working order will be large producers. The Company is working sixty-five men underground and sixteen men in the mill. The mill is turning out on an average $25,000 worth of bullion per month. About one-half of the miners are engaged in prospecting and opening up the ground.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

18 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

"NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishmcnt, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every hranch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U S. and Foreign Patents issued to inventors on the Pacific Coast have heen obtained through our Agency. We ean give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Mining Share Market.

The principal attention of mining stock speculators is just now turned toward probable developments in Hale & Norcross, on the Comstock. An *Enterprise* reporter visited the office of the Hale & Norcross the other day, and was present when the assayer brought in his report. There had been about 25 assays made of samples taken from different parts of the crosscut on the 2,900 level, and the lowest assay was $10.80, and the highest $780. The average assay was about $35. The work is being pushed rapidly, and the crosscut was eight feet in good ore. Superintendent Keating, Morris Hoeflich, Sam Jones and Archie Borland were examining samples just brought up when the reporter made his visit, and they all seemed pleased with the prospect.

At the north end mines everything is going on as usual. They are repairing machinery at the Sierra Nevada, and have cut into the Mexican from the 500 level drift of the Ophir. Nothing is being done at the Union works on the surface, no one being employed on the top but two watchmen.

At the Gold Hill mines everything is running smoothly, and the usual amount of low-grade ore is being extracted and sent to the mills.

Bullion Shipments.

Eureka ore, Feb. 27, $2600; Ontario, 27, $16,630; Germania, March 1, $3874; 5, $7,106; Holmes, Feb. 28, $6,000; Christy, March 3, $1,450; Germania, 3, $8,163; Wood River ore, 3, $807; Stormont, 3, $1,720; Eureka ore, 3, $1,950; Crescent, 3, $7,670. Wells, Fargo & Co.'s bullion shipments from Silver Reef for the month of February aggregated $30,345.50. Ten cars of ore, valued at $233,150, and 14 cars of bullion, valued at $323,756, was the shipment from Salt Lake for last week.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

F. W. SMITH, Arizona.
C. H. EBERLE—Alameda County

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Number 252.

We caution persons looking for our office against AN abominable irregularity in the numbering of stores in our vicinity on Market street. This office is number 252 Market street. The next doorway eastward, (towards the water front, formerly numbered "250") has recently been labeled "218." Four doors westward the number 400 appears. Across the street from us the number is 325. Remember our elevator is at No. 12 Front street, and our stairway entrance No. 252 Market street, third stairway below Front street.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY TO THE LABEL ON YOUR PAPER.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

THE thermometer at the horax works at Death valley is said to have marked 120 degrees in the shade at mid-day one day last week.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING FEBRUARY, 24, 1885.

312,948.—RECTIFYING LIQUORS BY ELECTRICITY—Thos. Atkinson, S. F.

312,709.—VARIABLE ECCENTRIC—W. H. DeValin, San Rafael, Cal.

312,623.—ROLLER MILL—F. Ferrier, Vallejo, Cal.

312,784.—FIRE ESCAPE—Z. LUDWIG—Oakland, Cal.

312,649.—REVERSIBLE PLOW—C. Myers, S. F.

312,671.—CHURN—W. H. Tambling, S. F.

312,672.—BOLTING REEL—A. J. Terry, S. F.

312,775.—SPRING SEAT—Robt. Walker, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HOSE PATCH.—Geo. W. Towle, Jr., San Rafael, No. 312,406. Dated Feb. 17, 1885. This invention relates to the class of hose patches in which a sheet, strip or plate of suitable material—such as brass or other sheet metal—is made to encircle the hose and cover the break or slit. The invention consists in an improved arrangement of the devices on the patch, whether on the slit or tongue side, with which the tool or implement for clamping or seating it firmly in its place engages, and is an improvement on the fastening devices by which it is permanently fixed.

ARTIFICIAL LEG CORD.—Menzo Spring, S. F. No. 312,396. Dated Feb. 17, 1885. This invention relates to an improved cord which joins the foot to the leg portion of artificial legs; and the invention consists in a peculiarly plaited or braided outer covering or casing for the body or core of the cord, and in the connection between the top of the cord and the screw. The object of the invention is to provide a casing for the body or core of the cord, which by being plaited or braided is not only adapted to resist the twisting strain, but will even tighten on itself, and cannot become rigid or stiff as the nut is turned in either direction, forward or back; and the further object is to provide a simple and effective connection between the top of the cord and the screw.

SPRING SEAT, Robert Walker, Oakland, No. 312,775. Dated Feb. 24, 1885. This is a combination of springs and levers which is especially applicable in the construction of seats, and form an improvement on a previously patented device by the same inventor. The improvement consists of eight levers or arms, which may extend from each corner of the seat supported by them to a central point, where a single joint similar to that of tongs is made, so that all eight arms branch outwardly from this joint, four being above and four below the joint. Between each upper and lower pair of arms a spring is inserted whereby the vertical movements of the seat are equalized without reference to the position of the weight upon the seat. It further consists of an adjustable hack-piece for the seat, and to certain details of construction.

NOTICE

Is hereby given that a meeting of the stockholders of the Lord of Lorn Gold and Silver Mining Company (a corporation) will be held on the 11th day of May, A. D. 1885, at one o'clock P. M., at the office of said corporation, in room No. 6, in building No. 318 Pine street, in the City and County of San Francisco, California, for the purpose and with the object: First, of increasing the capital stock of said corporation, so that the whole amount or par value thereof shall be $10,800,000, divided into 108,000 shares of the par value of $100 each; and, Second, to repeal the by-laws of said corporation, or any part thereof, and to amend the by-laws, or to adopt new by-laws therefor, as said meeting may determine. By order of the Board of Directors and Trustees, and of the President. March 7, 1885. JAS. T. MCDOUGALL, President.

R. N. VAN BRUNT, Secretary.

Engraving Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG. } **Dewey & Co.'s Scientific Press Patent Agency** { ESTABLISHED 1860.
INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of originas cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not ew. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

INGERSOLL ROCK DRILLS

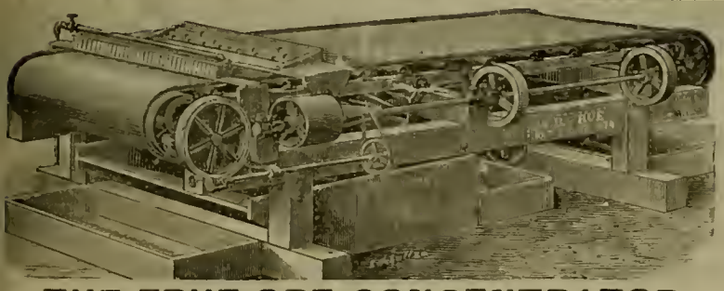
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

HOISTING WORKS

Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

Adapted to all Requirements.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.

To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

VOLUME XLXX Number 11.

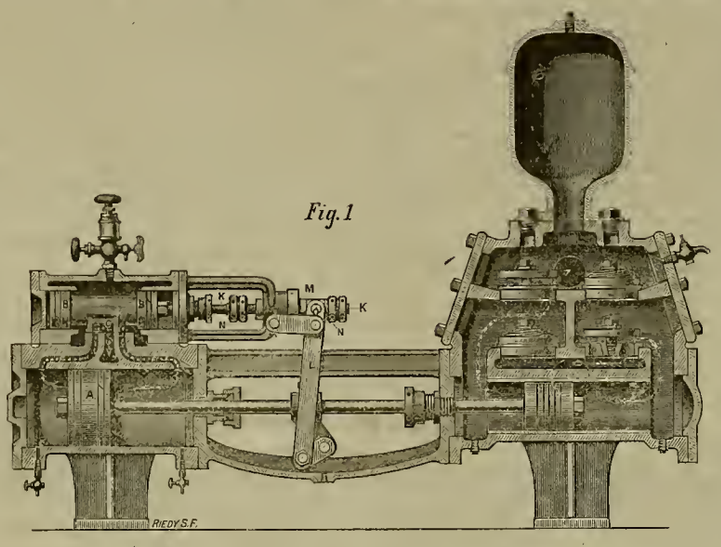
The Dow Steam Pump.

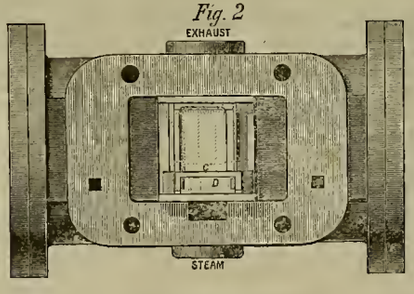
The pumps made at the Dow Steam Pump Works in this city have been adopted by some of the largest engineering firms and modern enterprises on the Pacific Coast, and are built with many modifications to meet special requirements. The improved valve motion, taken together with the simple construction of flat steam slide valves, ingeniously arranged to effect a proper distribution of steam to handle the pumps, under all conditions of speed and pressure, entitles it to its reputation as a most positive motion independent steam pump that can be maintained to its work by single adjustments within the means and knowledge of the engineer in charge. There are no small obscure ports or passages in the steam chest to puzzle the engineers when they become deranged.

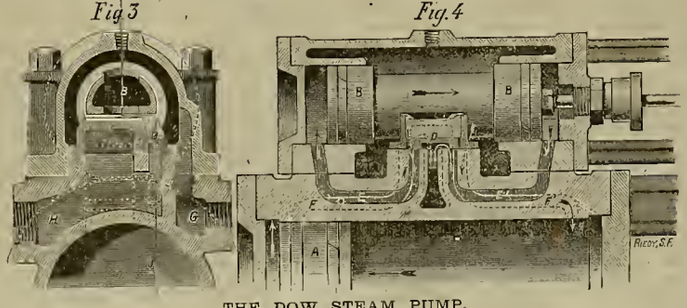
Sectional views herewith, will serve to illustrate the elements employed to perform the distribution of steam in operating the pump, whereby the main steam piston, with its rod directly connected to the pump piston, is caused to reciprocate within its cylinder and have no point in the stroke where it cannot start when steam is turned on, and be able to run at the lowest possible speed without centering, *i. e.*, with the main valve in such a position that the main piston cannot reverse. Also gradually starting and stopping the piston close to the ends of the cylinder, with safety at high speed, so that the pump cannot do itself injury; and to allow the water valves to seat quietly before the return stroke commences.

By reference to longitudinal section Fig 1, it will be seen that a plain slide valve C is used to actuate the main steam piston A, through the ports F and F', as indicated by the arrows. This valve is moved in connection with auxiliary piston B, a recess being provided in the latter for that purpose. Reference now being made to plan of valve seat, Fig. 2, the main valve C is shown together with a small flat slide, or auxiliary piston driving valve D. The requirements and action of this auxiliary valve, will now be described and reference made to center cross section Fig. 3, which shows auxiliary piston B, main valve C, auxlliary valve D, steam inlet G and exhaust passage H; Fig. 4 being a longitudinal section showing auxiliary valve D and ports E and E', through I, J, Fig. 3.

With the steam piston A, moving in the direction of the arrows, motion being imparted to the valve stem K, by means of the vibrating arm L, and sleeve M, acting against adjustment nuts N, on valve stem K, as shown. The valve driving piston B, being fixed to valve stem K, will move the auxiliary slide valve D, over the ports E and E', at the same time with but a little in advance of the main valve C; both valves being carried in a recess of the auxiliary piston B, and a slight longitudinal play or lost motion allowed the main valve C, to enable it to follow slightly behind the auxiliary valve D, relatively causing the latter to lead the main valve C, and just before the steam ports F and F' are closed, controlling the admission of steam to, and exhaust from, the main cylinder; steam will be admitted to the chamber of auxiliary piston B, through port E, and exhaust from the other end through port E, acting upon the piston B, to continue the movement to reverse the valves thus far produced by the positive mechanical connection to the main piston A, governing its movements in the cylinder. It will be observed that the main steam piston A, main steam valve C, also auxiliary piston B, and valve D, are moved with a positive mechanical connection in such a manner that the main steam and exhaust ports are closed with each movement of the piston; and that to work this piston close to the ends *positive* in its action. As the main valve C is moved by a mechanical connection from the main piston entirely, in closing its ports, much steam is saved from uselessly rushing into the cylinder on completing each stroke, thereby reducing the terminal pressure and quality of steam used for every movement of the piston.







THE DOW STEAM PUMP.

of the cylinder, is but a matter of the adjustment of the nuts N. The piston is thus slowed down gradually upon completing its stroke particularly in running fast (when most required) allowing the water valves to seat quietly, preventing concussion or jar, common in other steam pumps. It cannot strike the cylinder head in running fast, as the main valve C will be reversed in time to prevent it.

The employment of auxiliary piston B, its valve D, and operated in connection with main valve C, as described, allows the pump to work at any speed, however fast or slow, without a dead point in the stroke, being thereby perfectly

It will be seen from the above that the main steam valve is moved mechanically by the engine, and with the same certainty as the slide valve of an ordinary crank engine operated by an eccentric. It does not, however, as in the latter case, depend upon the power stored up in a fly-wheel to carry the main valve past the center of its travel; as the steam pressure acting on the auxiliary piston, through the medium of the small auxiliary valve, which is moved in connection with the main valve, and in such a manner as to complete the movement of the latter, commenced by means of its connection with the main piston.

Safety Lamps in Mines.

The use of the various kinds safety lamps in coal mines is now so universal that we often wonder why it is accidents occur as frequently as they do from fire damp. One thing is true, that the regulations are usually strict enough; but possibly the men are not always as fully informed concerning the use of the lamps as they ought to be. In addition to the regulations, the miner should be informed of the special recommendations with respect to the use of his lamp. He should be especially advised to handle the lamp carefully; not to expose it to too strong currents of air; and not to produce in the air, by shaking his clothes or otherwise, violent motions capable of agitating the flame of the lamp. He should also be recommended not to expose his lamp to be broken or injured, and to hang it up in the working place in such a manner that it be not likely to fall, and so as not to be in danger of being struck by a pick. Those men who are provided with a Mueseler lamp should be informed that it is easily extinguished when inclined; and that it goes out in an atmosphere containing fire-damp in explosive quantity. Those who, under exceptional circumstances, are entrusted with a Davy lamp, or one of similar character, should be informed of the special danger which it presents when filled with flame, or when the gauze becomes red hot. It should be pointed out to them, that in such a case, they should not blow on to the flame, but that they should, on the contrary, protect it carefully from all air current, agitate it as little as possible, and cover it as well as they can with their clothes or hat; and immediately, but without precipitation, abandon the dangerous place where they may happen to be. In fine, they should be shown the characteristics by means of which the lamp, of whatever type it may be, is capable of indicating the presence of gas, and be recommended to complete their information on this point, as well as on all others, in the mine itself, through either their comrades or the foreman.

The men provided with a safety lamp ought to examine it frequently, so as to ascertain the state it is in, and appreciate the conditions of the atmosphere wherever they may happen to be; in a working place the man acting as a chief is specially charged with this examination. He ought to be especially recommended, when he sees that the flame of his lamp becomes elongated more than usual, to proceed to an attentive search for fire-damp by bringing his lamp into all parts of the working place. If this gas be not merely limited to a few points, and present in unimportant volume, but if it be tolerably general in the working place, he must clear it of the men and give notice at once to the foreman.

The head of water in six-mile canyon is unusually light for this season of the year. The various quartz mills are compelled to run at only about half their capacity. The stamps are kept pounding away through the day, and are hung up at night, when the pans are stirred up for the purpose of amalgamating the pulp crushed through the day, as the water power is now insufficient to run both stamps and pans.

News from Wood River is to the effect that the deputy sheriffs are to be withdrawn from protecting mines—Broadford being quiet and the mines having a complement of men.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Fresno County Mines.

[Written for the PRESS by F. W. S.]

The mineral resources of Fresno is a matter of no small importance. Situated in the eastern and northeastern end of the county is a number of districts that so far as developed have proven to be rich in both quality and quantity of their ores. The three principal districts are the Potter Ridge, Quartz Mountain and Fine Gold. They adjoin each other in the order mentioned; the first mentioned being the farthest north. The ores are free milling quartz, and run from $10 to $80 per ton. The cost of extracting and milling is said to be from $6 to $25 per ton. Lack of water for milling purposes is the greatest drawback to these districts. A twenty-five mile ditch with a carrying capacity of 4,000 miners' inches, is being constructed by the Quartz Mountain Mining Company. This ditch, it is thought, will be complete by July next. In addition to their own wants, this company will be able to supply the prospectors and mine owners of the district with a sufficient supply to develop and discover more new mines.

Potter Ridge District.

This is Fresno's most promising mineral district. It is some 60 miles northeast of the city of Fresno. The mineral belt runs north and south, and is on an average some four miles wide. This district claims in length some eight miles. A number of stamps, a Red Stone and a Huntington mill have been put up in the district, and are all reported as being steadily at work. The character of the ores and the necessity of extensive works for the profitable treatment of low grade ores make this district one that can only be successfully opened by capital. True fissures are said to exist in both this and the Fine Gold district. Two months hence development will be increased and the output is expected to be sufficient to boom the mines of the county.

Quartz Mountain District.

Miners interested in this district, claim everything in the shape of mineral bearing ores; not only this but "oodles" of it. In the way of veins the district boasts of all kinds, from a gash vein to one the width of the district. The Quartz Mountain mine is said to have derived its name from the fact of its being on a whole mountain of quartz. The company have put up a 60-stamp mill and will, it is said, erect another one of the same number of stamps as soon as their big water ditch is finished. On their main vein they have run an incline to the depth of 240 feet, at which point a 50-foot drift on each side of the incline shows a 9-foot vein of ore that pays over $15 per ton. This company have some 600 acres of patented ground and will undoubtedly reap an abundant harvest when their extensive works are working on full time.

Fine Gold District.

But little development has as yet been made in this district. The mineral belt is about four miles wide by eight miles long. The characteristics of the ores are the same as the Potter and Quartz Mountain, only that in richness the quartz of Fine Gold is much the best. There are a number of stamp mills in the district; also a Huntington mill. A sale was recently made to San Francisco capitalists of a mine in this district for something like $25,000.

The miner is now a resident of Fresno City. Preparations are being made to push the work of development on the mines of this district during the next 60 days. From $25 to $200 per ton is claimed can be realized on the ores of Fine Gold.

Silver Mines.

The Mount Raymond mines, near the Mariposa Big Trees are claimed to be developing wonderful results. The formations are limestone and porphyry. The ores are galena. A test shipment recently made to the Selby Works, at San Francisco, is said to have returned $50 per ton in silver and 55 per cent in lead. These mines will be closely looked after during the spring. Many locations have been made, and the woods will probably be full of prospectors as soon as the season opens.

Iron Workers' Wages.

EDITORS PRESS:—We have seen a clipping from the San Francisco *Chronicle*, under date Feb. 20th, and must say that the statement made by Mr. Richard Savage, of the Empire Works, surprises us. We have a fair knowledge, we think, of the wages paid to mechanics in all lines of business in the manufacture of iron on the Pacific Coast, and we know that the present rate of wages paid in San Francisco is no higher than the rate of wages paid to mechanics in this city by *our firm*. We pay the highest rate of wages of any institution we know of in the East engaged in our line of business. We employ the very best line of workmen, and it is small business, we think, for Mr. Savage, of the Empire Works, or any one else, to try and make a reduction in the wages of their workmen *by claiming* that it is a necessity, owing to the fact that *we* are paying 25 to 40 per cent less in our shops to our men, than Mr. Savage and others in the same line of business are paying in San Francisco.

We dispute the truth of this statement. Of course, if the Pacific Coast manufacturers find it necessary to make a reduction it is their business, but we think they should make the reduction without reflection upon manufacturers elsewhere, especially when they make statements that are sototally in the wrong as the statement made by Richard Savage, of the Empire Works.

We ask that you will give space in your next issue to this letter, as we feel that we are justified in denying the statement made by Mr. Savage, as published in the San Francisco *Chronicle*, about the 20th ult.

Yours truly,
FRASER & CHALMERS,
Chicago, Feb 29th.

California's Exhibits at the World's Fair

The California section in the government and States' building at New Orleans occupies 14,450 square feet, the second largest space of any State or Territory—Texas having 18,145 square feet, and Kentucky, the third largest, having 13,100. This space is chronicled on Chief of Installation Mullen's books as taken by C. B. Turrill for the Southern Pacific Railroad Company of California. Mr. Turrill's company has not only made almost the entire display which is to be seen in the name of California, but has permitted its agent to act as Commissioner since the opening day.

The following summary of California exhibits is made by a correspondent of the *Bulletin*:

1. The section of the Calaveras big tree and bark, which is a great attraction—probably the greatest in the building.

2. The very handsome exhibit of blankets from the Golden Gate Woolen Mills, which is also particularly attractive.

3. The honey exhibit of J. E. Pleasants, of Los Angeles county; the finest display of the kind ever seen in any land.

4. A fine display of canned and evaporated fruits, seeds, grains and grasses, cocoons, vegetables, raisins, cheese and wines from Sonoma county.

5. A table containing mammoth squashes, beets, pumpkins and sweet potatoes from Santa Clara and Los Angeles counties.

6. Stand of shelves with fruits, berries and grapes in solution from Sonoma county.

7. Three two-wheeled vehicles from California manufacturers.

8. Stand of shelves of jars of wheat and other grains from Yuba, Colusa and Sutter counties.

9. Stand of shelves containing jars of one hundred kinds of almonds from Solano county; also raisins from Brigg's Bros., same county, and a fine display of grains in glass, and raisins and prunes from Vacaville, and fruits in solution.

10. A magnificent pyramid of pampas plumes from Santa Barbara county.

11. Stand containing wines, fruits, dried and in solution, grains, cocoons, almonds, walnuts and filberts from Nevada county.

12. Evaporated fruits, Irish potatoes, fruits in solution, grain in jar and on stalk, and slate from Napa county.

13. Stands of shelves of Napa county port, Reisling and Zinfandel wines; also honey, potatoes, fruits in solution, and grain on stalk from Napa county.

14. Stand of shelves with Angelica, sherry, white and claret wines from Napa county.

15. Cube representing the actual amount of solid silver taken out of California mines ($26,000,000.)

16. Cube representing output of gold in California since the discovery ($1,078,685,167). Eight large cases of California mineral specimens.

17. Case of woods from various parts of the State.

18. An invention of hydraulic mining, displayed by Hoskin & Co.

19. Two tremendous planks from the California Redwood Company of San Francisco.

20. A lot of redwood posts and ties, some of which have been in use in the ground for twenty years.

21. A monster redwood plank from W. H. Perry, of Los Angeles.

22. Large number of specimens of redwood, laurel, willow, manzanita, in sections and in timbers and lumber, finished, polished and otherwise, some of which are sent from Pope & Talbot.

23. Saw and stand from N. W. Spaulding & Co.

24. Another lot of California woods.

25. F. A. Huntington's centrifugal roller quartz mill.

26. Sanborn's new chain pulley.

27. A magnificent exhibit of redwoods from the Loma Prieta Co., including many curly and bird's-eye varieties in a high state of polish.

28. Another exhibit of California woods, including pine of many kinds, redwood, sycamore, maple, mahogany, mulberry, myrtle, laurel, live-oak and other oaks, lemon verbena, manzanita and other woods.

29. A great display of all kinds of nuts, raisins, vegetables, grain in jars and on stalk, and fruits dried and in solution, from the rancho Chico.

30. Stand of corn from Butte county.

31. Table containing corn, canned fruits, cocoons, fruits in solution and a monster squash from Butte county.

32. Fine display of fresh fruits and fruits in solution, seeds, soil and wood pulp in various stages, from Placer county.

33. Fruits in solution, grain in glass and on stalks, beet sugar, walnuts and evaporated fruits from Alameda county.

34. Table of apples which were picked in September last and which show no signs of decay.

35. Bale of alfalfa, flour, peanuts, soil, mineral waters, grain in jars and on stalk, fire-brick and sewer-pipe, horse shoes, beans, potatoes, cocoons, squashes, and hops from Sacramento county.

36. Wheat, corn, maize, dried fruits in solution, raisins, sweet potatoes and grapes from Yolo county.

37. Squashes, almonds, beets, potatoes and dried fruits from Sacramento county. Grains in jars and on stalk, dried fruits, harvester model, horse medicine, insect powder and wheat and flour in bags from San Joaquin county.

38. Table of macaroni and vermicelli in boxes with glass covers from San Francisco.

39. Five bales of cotton and samples of soil from Kern county.

40. Stand of shelves containing corn, wheat, cotton and fruits in solution from Tulare, Merced and Stanislaus counties.

41. A splendid exhibit of assorted wines from Sonoma county.

42. Stand containing buck kids for gloves from Napa county and Mrs. Hill's insect powder from Calaveras county.

43. A stack of flour from Horace Davis & Co., San Francisco, and from Sperry & Co., Stockton.

44. A fine stand of California brandy from Jarvis & Co., San Jose.

45. The Pacific Incubator, from Oakland.

46. A stand of wheat and flour in bags from Santa Clara county.

47. The squash weighing 222 pounds and some monster sweet and Irish potatoes.

48. A handsome model of the "Cyclone" windmill from San Jose.

49. A stand of the celebrated Naglee brandy, built in pyramidical shape.

50. A pyramid of Cartalian water.

51. Stand of shelves containing fruits, dried and in solution, figs, raisins, wheat in jars and on stalk, nuts, and a line of wines from Fresno county.

52. Stand containing fruits in solution, dried and evaporated, burr clover, wheat in jars and on stalk, beans, nuts, barley, peas, grapes, jellies and monster beets from Santa Cruz county.

53. Five bales of hops from Sacramento county.

54. Stand of shelves containing a full line of seeds from W. R. Strong & Co., Sacramento.

55. Leather in rolls from the California Leather Co., of San Francisco.

56. A case containing 58 varieties of beans from Santa Barbara county.

57. A matchless exhibit of oranges, lemons, limes, walnuts, almonds, dried, preserved and evaporated fruits, olives, olive oil, raisins, figs, seeds, fruits in solution, tobacco, cocoons and red and white wines from Santa Barbara county.

58. A splendid exhibit of raisins and semi-tropical fruits from Riverside, San Bernardino county.

59. Stand containing 100 varieties of preserved fruits, berries and grapes from Mrs. George A. Cook, Lugonia, San Bernardino county.

60. A marvelously fine display of oranges, lemons, limes, almonds, walnuts, peanuts, chestnuts, olives, olive oil, wheat, flour, barley, rye, canary seed, corn, oats, grains, pampas plumes, dried, preserved and evaporated fruits, fruits in solution, salt, tobacco, cotton, raisins, figs, ostrich eggs, cocoons, etc., from Los Angeles county.

61. Hemp, grain, canary seed and fruits in solution from San Mateo county.

62. Grand exhibit by National ranch of San Diego county of grains and corn in jar and on stalk, olives and olive oil, jellies, fruits in solution, dried and preserved, grains, hemp, grapes, figs, raisins, etc.

63. Cases of cocoons, skeins, cloth and threads of silk from San Jose, but sent by Keane Bros., of San Francisco.

64. Table of ale and porter from the Stock Brewery of San Francisco.

65. Table of assorted wines from J. Gundlach & Co., San Francisco.

66. A stack of Wellington's egg-food.

67. C. Richard Knapp's vacuum-press percolator.

68. Table of shelves containing Paul Rieger's extracts and ginger, desiccated cocoanut from the Pacific Cocoanut Company of San Francisco, Siam rice from the India Rice Company of San Francisco, macaroni and vermicelli from the Italian Paste Company, seeds from R. J. Trumbull & Co., and canned salmon from King, Morse & Co., oriental powder, Hanly's catsup, etc.

69. Case of gloves and case of elastic trusses and German granulated soap from San Francisco.

70. Table containing California literature, including 70 kinds of books and pamphlets and many papers.

71. Pyramid of canned goods from Cutting & Co. of San Francisco.

72. Whole line of goods of Guittard & Co. of San Francisco, embracing chocolates, cocoa, spices, teas, etc.

73. Model of street-car with safety guard, faucets, asbestos, demijohn boxes, fruit steamer, boiler cleaning compound, etc.

74. Handsome exhibit by San Francisco Varnish Works.

75. Case of giant powder (or what is supposed to be giant powder), and fuses.

76. Exhibit of borax by William T. Coleman & Co. of San Francisco.

77. Case containing the shovel which cast up the first earth in the construction of the Central Pacific Railroad.

78. Twenty cases of California grains and flowers, each containing 50 plates, arranged by Prof. Lemmon and wife—a very fine exhibit.

79. Tibbal's patent sanitary sewer trap and tide gate.

80. Two Antisell pianos.

81. Four cases of Bancroft's books.

82. Archer's mammoth bee-hives, from which 770 pounds of extracted and 60 pounds of comb honey may be taken from a single hive in a single season.

83. Stand of corn-broom, corn and mammoth vegetables from Los Angeles county.

84. A very attractive pyramid of crystallized fruits in a high glass case from Barnard & Benedict, Los Angeles. This is a very handsome exhibit and attracts great attention.

85. Bale of alfalfa, stand of wild oats and jucca dragonis from Los Angeles county.

86. Fine display of wines and brandies from E. J. Baldwin, Los Angeles county.

87. Stand of shelves of Fredericksburg beer in pints and quarts.

88. Stand of fruits in solution, jellies and preserves from Santa Clara county.

89. The same, mostly from San Jose.

90. Display of honey from Williams Bros., Los Angeles county.

91. Orange and lemon trees in fruit from Los Angeles county.

92. Sugar-cane, tobacco and cotton plant, and a large variety of grains from the National ranch, San Diego.

93. Table of oranges, limes and lemons, just received from Wolfskill, Pasadena and Santa Ana ranch, Los Angeles county.

94. A beautiful exhibit of pampas plumes by Mr. Stewart, of Los Angeles.

95. Last, but not least, two handsome displays of soap by the Standard Soap Company of Berkeley.

Besides all these, Jarvis & Co., of San Jose, E. J. Baldwin, of Los Angeles county, and Jackson, of San Francisco, make exhibits in the main building—the former of brandy, the second of wines and brandy, and the last-named of abalone jewelry and other work.

Ruby Hill Tunnel.

A reporter of the *Sentinel* visited on Sunday last the Ruby Hill Tunnel, an enterprise owned and managed by miners and residents of Eureka. The tunnel or adit is meant to prospect at depth the properties of the Ruby Hill Tunnel and Mining Company, comprising the Wolverine, Jones and Kyle, Nondescript, Tip Top, Ma Ma, Mary Ann, Bottom Claim, Little Mack, Silver Brick, New Claim, Try Square, Cosmos, Compromise, North Tyndal, Tyndal, Plumed Knight, Van Buren, Perry and Jeff claims. The company has also secured a title to an eligible millsight at the mouth of the tunnel. The titles to all the above properties have been secured from their original owners, they taking stock in the present corporation in payment for the same. The tunnel was commenced some two years ago, during which time the header, 5x6 feet, has been advanced a distance of 860 feet. The entire work has been done by contract, and the cost of the same has been raised from time to time by one cent assessments. It is about the most economically managed piece of mining in Eureka district. The stock is all closely held, and it is believed that when the tunnel header is advanced another hundred feet a rich mineral section will be tapped. Thus far a great many good-sized pockets of iron have been encountered and passed through, also crevices, into which stones can be thrown and heard to rattle down a distance of 100 feet. The character of the face of the tunnel is lime stained with iron and containing pockets of iron. Many who have a practical knowledge and understanding of the formation of that section of mineral country, wherever prospecting has been done, have wondered why the company has not prospected on indications passed through, so promising are they, but it is the company's desire and intention to reach a given point with the tunnel header before any prospecting is done. The surface indications of the numerous properties are most encouraging. Should the owners of the enterprise realize one-third what they have reasonally a right to expect as the result of their present work, it alone will perpetuate this town for many years to come.—*Eureka Sentinel.*

THE EUREKA FOUNDRY.—The Eureka foundry has again commenced operations, and a number of men there are busily employed in making castings for the New Eureka Con. furnaces, some of which castings will weigh upwards of 3,000 pounds each. Aside from the side issues in connection with a few large reduction works, this is said to be the only foundry now operating in Eastern Nevada.

MECHANICAL PROGRESS.

Cast Iron Malleable.

After all that has been written to define the difference between malleable iron and cast iron made malleable, there is a lack of information that requires further statements of facts. In the parlance of our English cousins, malleable iron is our "wrought iron." All wrought iron is considered malleable—capable of being spread under the hammer—but our malleable iron is brittle cast iron made capable of being bent cold, of being changed as to form by pressure or by percussion, and sometimes of being forged like real malleable, or "wrought" iron.

But cast iron can be softened without being made malleable; it is simply a process of annealing. Small articles of cast iron frequently become so chilled in the sand of the mould as to be impervious to the coaxing of the file or the persistence of the drill. In some establishments where minute iron castings are made, it is necessary to anneal them, even if they are not to be subjected to any tool processes; the attrition of the tumbling barrel would test their tenacity. As they come from the foundry, they are as brittle as nnannealed glass. To anneal these brittle products, they are packed in cast iron boxes with sand—ordinary quartz sand—subjected to a red heat for about forty-eight hours, and allowed to cool gradually. There is no chemical virtue in the sand—it is merely a conservator of the heat, and the degree of heat is not sufficient to fuse the sand or to even round the corners of the sprews of the castings.

But to make cast iron malleable—to change its quality from the brittle, almost vitreous, condition of the casting to that of the almost plastic or malleable quality—requires a different treatment. The art is not modern, for as long ago as 1826 the Franklin Institute awarded a premium to Seth Boyden, of Newark, N. J., "for an assortment of huckles, hits, and other castings of annealed cast iron remarkable for smoothness and malleability." The uses of the process have been greatly extended since 1828, and its possibilities are better understood now than then. Kitchen spoons which are to be tinned are not made of wrought iron, but they are cast and made malleable. The blanks for the spoons are cast of iron, perfectly flat, giving only the outline of a spoon. These blanks are so brittle that they have to be handled like eggs in packing them for the softening process. When made malleable and cooled, they are "struck up"—formed—in dies, and thinned or nickeled. Skate irons are produced in the same way. The irons are cast iron; then subjected to the malleable process, dressed and finished, and case-hardened. It is claimed by some skaters that these skate irons are superior to those made of steel.—*Scientific American.*

The Turning Lathe.

But few people realize the extent to which turned work is used in cabinet work, and a still less number know of the perfection reached by the turning lathe.

Less than a hundred years ago, pole lathes were in operation. They consisted of two centers, the work hung between them, the ordinary rest, a spring pole overhead with rope attached. The rope was passed twice around the wood to be turned, and the foot placed in a noose near the ground. When the weight of the body was thrown upon the rope the wood revolved between the centers. When the pressure was removed, the spring pole, from which this machine took its name, caused the noose to ascend ready for another tread. The turner applied his gouge at the same time he did his foot, and thus worried off some of the wood. To trace step by step the improvements in this machine would require a volume.

The application of continuous rotary motion by the pulley, belt and fly-wheel was a big step. Then the lathe was capable of its best work. All later improvements have only tended to increase the quantity instead of the quality of its production. Mr. Weymouth, of Fitchburg, Mass., by his lathe, increased a thousand-fold the production of this tool. His lathes are known the world over.

For large work the spiral back knife does the business slick and clean. The knife is first forged to fit a cylinder in such a manner that it extends one-third the way, or less, around it. It is now put in an engine lathe, still upon the cylinder, and turned.

This makes a plain spiral knife. It would trim a straight object. Now, the design is cut upon the face of the knife. If a table-leg is to be made, the knife is turned down until that leg will just fit into it. The shape of the knife will be just opposite that of the pattern. When finished and tempered, the knife is hung back of the lathe. A tool upon the sliding carriage takes off the corners and then our back knife comes slowly up to its work; being spiral, but little cutting surface is at work at one time, and it cuts easily, cleanly and quickly. No matter which way the grain runs, this knife cuts it off and the work is soon done. Spiral cutting knives are the thing to have. They will do lots of good work.

METAL CUTTING MACHINERY BY A LADY INVENTOR.—Madame De Long, it is announced, is about to introduce into England, metal-cutting machinery of her invention, which has for some time been in use in France. She first conceived the idea of her wonderful apparatus nearly twenty years ago, when paralysis of the right arm forced her to abandon the trade of jeweler-worker. She has now perfected machinery, worked by steam power, which cuts with the utmost precision the hardest and softest metals, in any design. By it she can cut a gold lace pin or a steel castle portcullis from the solid metal, without any molding or filing. And all her apparatus and operations are of the simplest description. She divides her industry into four general branches. The first is the production of gates, doors, balcony-fronts and other architectural metal-work, without casting. She has cut plates of brass a foot thick into lattice-work at a single operation. The second branch is the making of lattice metal-work filled in with glass, to supersede the ordinary leaden frame-work for church and other ornamental windows. The third branch comprises the inlaying of plush and ebony jewel-cases, cabinets, etc., with red and yellow copper, steel and other metals. The fourth department comprises the working of picture frames, baskets, crests, monograms, etc., turning them out of the solid metal fully finished without a single operation being performed by other means than the self-driven machinery.

Unequal Shrinkage in Castings.

The internal strains and forces that exert themselves within the material of a casting is enormous when the different portions are allowed to have their own time to cool, but can be partially removed by a gradual change in the temperature. The circular saw will neither buckle or run dishing while every part is heated alike, but is badly thrown out of order when heated in the center from an overheated bearing, or rim bound in the saw skerf. In the casting of a pulley, if the rim cools and sets first, the arms and hub must continue to contract and exert a strain on every part of the pulley. In the broken wheels that are sent to the repair shops, the arms are separated quite a distance from the rims when they have become injured, and the broken rim of a wheel shuts by so far that it is impossible to bring the rim in place without heating the arms and the hub in the center. Whatever part of the casting first sets, in cooling, must receive the force of contraction of the remaining parts, and the material in the center of a casting shrinking away from the outer surface must leave the casting porous and spongy. The exposed surface, in cooling, contracts and forces the material in the center to either escape or to occupy a smaller space, when in turn it last becomes cool and tends to draw the outer portions of the material after it toward the center. Advantage is taken of this principle to diminish the diameter of the bore of a piece of work by heating it to redness and cooling the outer surface, which forces the material around the bore to occupy a smaller diameter before the particles set in cooling. A tube thrust endwise into cold water, slowly becomes cooled to the water's edge and crowds in the heated material just above the water mark toward the central line of the tube, which in turn applies the force of contraction to those above them as the tube is slowly lowered into the liquid. Several applications are sufficient to refit a piece of work that has become quite loose. To avoid these internal strains, the arms of wheels are left curved, or if straight are inclined with the radius of the wheel, that the force of contraction may draw them into line with the face, or if curved, to pull the hub around till the strains are equalized. The pattern makers should know how the castings are handled in the foundry if they are not to be weakened by the contracting strains that exist within them.—*Boston Journal of Commerce.*

STEEL VS. PUDDLE IRON.—Notwithstanding the inroads which steel is making on the iron trade, it is apparent that the newcomer still has a very serious task ahead of it to supplant its ancient relative. This is very forcibly shown by a recent article in the Pittsburgh *Dispatch* descriptive of the condition of the puddling departments of the Pittsburgh iron works. Discarding the details given, we observe that the present total daily product of puddled iron in that city and its immediate vicinity is about 1,150 tons, which is 200 tons more than was turned out two months ago. A year and a half ago, says the *Dispatch*, the daily product of puddled iron reached between 1,600 and 1,800 tons. As a great part of the diminished output of puddled iron is the result of the depression in trade, and the daily product is still very considerable, it will be seen that the converter and the open hearth have much to do before they supersede the puddling furnace completely.

IMPROVED PRINTER'S CHASE.—A printer's chase has been invented in Milwaukee, and patented, which is adjustable in both directions. By a system of slides in the bars, fixed by set screws, the chase may be extended or contracted upward of one-half its superfices. In fact, it may be used as a self-locking chase—dispensing with furniture.

THE UNITED STATES makes one-fifth of the iron and one-fourth of the steel in the world. Of the gold supply this country furnishes one-half, and of the silver, one-third. The United States represents 36, Great Britain 33, and all other nations, 31 per cent of the mineral industries of the world.

SCIENTIFIC PROGRESS.

The Study of Thunder-Storms.

"The knowledge of thunder-storms," says *Science*, "is advancing at a good pace. France has made special study of them for a number of years. Bavaria and Belgium have more recently taken them up, and last summer they were made the subject of special investigation by our signal service, with the aid of a large corps of voluntary observers, that is to be continued during the coming season. A recent report by Lancaster, on the storms of 1879 in Belgium, confirms the conclusions previously announced there, and discovered to obtain so clearly in this country, that thunder-storms occur only in the southeast quadrant of the barometric depressions, or great cyclonic storms that frequently sweep across temperate latitudes. But there still remains to be found the actual mechanism of thunder-storms, concerning which various more or less theoretical opinions have been published. The matter will probably remain in doubt until settled by the same kind of investigation that demonstrated the inward spiral path of cyclonic winds. Synoptic charts for a stormy afternoon, with hourly or even half-hourly intervals, and stations only a mile or two apart, would probably settle the question beyond dispute, and the first local weather service that succeeds in preparing a set of such charts will gain a prize worth working for."

Their Origin.

At the recent congress of German medical men and physicists, Dr. S. Hoppe, of Hamburg, read a paper in which he sought to show that the electricity of thunder-storms is generated by the friction of vapor particles generated by the evaporation of water. This opinion was strengthened by several experiments in which compressed cold air was allowed to rush into a copper vessel containing warm, moist air, thus generating a large amount of electricity. He concludes that the rise of a column of warm, moist air into the colder atmosphere above will be followed by a thunder-storm if it acquires sufficient velocity to prevent neutralization of the electricity generated by the friction of the air. Hence, in his opinion, open districts denuded of forests are more liable to thunder storms than wooded regions, where the trees forbid the rise of humid air currents. We may cite in evidence of this, the fact that there is no part of this continent where severe and violent thunder-storms are so frequent as upon the treeless plains between the Mississippi river and the Rocky mountains.

Photographing Thunder-Storms.

A new and interesting feature in connection with this study is the fact that the camera has lately, in several instances, been brought to bear upon different instances when these meteorological phenomena have assumed extremely violent proportions and developed what are commonly termed "water spouts." A Kansas tornado which occurred in April last has thus been shown, engravings from which have appeared in several scientific publications. An unusually violent tornado which occurred in Dakota in August last was also photographed and transferred to wood by engraving. Although the destructive effects of tornadoes have often been photographed, we believe those referred to were the first views ever taken of a tornado itself. They were taken at a distance of several miles from their actual track. It is to be hoped that opportunities will be presented for additional work in this direction during the coming season.

An Awful Night at Sea.

In this connection we would give the following account of a most remarkable meteorological disturbance which was telegraphed to the *Morning Call*, of this city, from Victoria, B. C., on the 2d instant: "The bark *Innerwick*, Captain Waters, thirty-one days from Yokohama, has just arrived and the master reports a very stormy passage. At midnight on February 24th, in latitude 37 north, longitude 170 degrees 15 minutes east, the wind was blowing heavy from the south southeast, with the ship running before it under short sail. At 1 in the morning it increased to a living gale with the sky of a pitchy blackness. At 5 o'clock the captain, who was aroused by the mate, went on deck and found the sky changing to a fiery red as if the entire heavens were in conflagration. All at once a large mass of fire appeared over the vessel, completely blinding the spectators, at the time, and as it fell into the sea some fifty yards to the leeward it caused a hissing sound, heard even above the blast, causing the vessel to quiver from stem to stern. Hardly had this disappeared when the mate, clutching the captain's arm, cried: "My God! what's that?" pointing to a towering mass of foam rapidly approaching the apparently doomed vessel. The noise from the advance of the volume of water is described as deafening. As the bark was struck flat aback, and before there was time to touch a brace, the sails filled again, and the roaring white sea could be seen passing away ahead. To increase the horror of the situation another vast sheet of flame ran down the mizzen mast, from whose rigging poured myriads of sparks, and for twenty minutes the strange red of the sky remained. The master, who is an old and experienced mariner, declares that the awfulness of the sight was beyond description. He considers that the ship had a narrow escape from destruction.

Science as an Aid to Surgery.

There is no instance on record of perversity more unreasoning and unreasonable than that which appears to animate those who oppose experiments upon living animals with the view of solving physiological problems, which, without the method of direct operations upon living animals, must remain unknown. The beneficent results that have been obtained by this method of research are so evident to all who will examine the subject, that the attitude assumed by the anti-vivisection extremists is most illogical.

Without repeating what we have said in previous articles on this subject, we desire to place on record another striking example of the practical benefit to humanity that has resulted from experimental researches conducted upon living animals with the view of increasing our knowledge of the functions of different portions of the brain. These results could have been obtained in no other way than by direct operations on the brain substance of animals. The experiments in question demonstrated what had never before been thought possible—that the brain may be handled, irritated, and, in fact, partially destroyed, without necessarily endangering life. More than this, they have demonstrated the important fact that there are in the brain certain "centers" which preside over voluntary motion, which centers it has been possible to localize with great precision, and, as one of our contemporaries forcibly puts it, "a topography of the cerebrum has been constructed, in which the various faculties have been mapped out."

The experience of physicians has enabled them heretofore to determine, from certain symptoms, the existence of disease of the brain, but they have been quite in the dark in the matter of locating it, and the unfortunates so afflicted were beyond reach of human aid.

The knowledge gained by experiments upon animals in the laboratory of the physiologist, however, has given the surgeon such precise and valuable knowledge of the local functions of the brain, that in many cases he is enabled now, from a careful study of symptoms, to locate a tumor at a certain definite spot within the brain, and by surgical operation to remove it, a feat which has been successfully accomplished.

PERMANENCE OF THE OCEAN BEDS.—Although geologists are accustomed to deal with considerable alterations of level as one of the causes operating to bring about profound changes in the topography of many regions, it has always seemed difficult to conceive that the vast depressions in the face of the earth now occupied by the oceans, could ever have been subject to such tremendous changes as would be necessary to convert them into land. Many geologists appreciating this difficulty, are inclined to believe in the general permanence during all time of the great oceanic beds, and of the continental areas.

To account for the origin of the oceanic basins, Mr. Fisher, in the Geological Magazine, proceeding from the theory of Prof. Darwin, that the moon broke away from the earth more than fifty million years ago, he thinks the ocean basins may be the scar left by the breaking off of the moon's mass, and that the basement rocks of the continents are fragments of the crust which had already solidified, and which were left behind.

THE ANCIENT CHINESE WERE MOUND BUILDERS.—Searching the history of China for evidence of a stone age, Joseph Edkins finds that as far back as B. C. 2,205, in the time of Yu, all the common metals are mentioned in a list of tribute offered the emperor. Fifty years before the Emperor Shun had buried gold to make the people less covetous. A stone hatchet has lately been found near Kalgan in a mound 40 feet high. The mound and others in its neighborhood are said to resemble those of Ohio, and the hatchet is not to be distinguished from those of the "mound builders" in Ohio museums.

OLIVE OIL.—If fatty oils are cooled down to —20°, and kept at this temperature for three hours, they assume very different degrees of hardness, olive oil being the hardest. To determine this point the author uses a cylindrical iron rod, one centimeter in length, and ending below in a cone. Upon it is exerted a pressure measured in grams until it penetrates into the oil with its entire length. The best olive oil required a pressure of 1,700 grms., while the cotton oil required only 25 grms.

RAILROAD TIME TABLES.—All the railroad time-tables are planned, and all changes made upon them, by the use of spools, pins and colored thread, instead of pen and ink. Paper is marked off by horizontal and perpendicular lines into five, ten, or even two-minute time, and threads are stretched across the paper to indicate the trains and fastened with pins.

THERE are supposed to be about 1,000,000 species in the animal kingdom, and the whole number of insects is set at 500,000. Of beetles alone, over 100,000 species are known; of the higher animals there are 1,200 mammals, 7,500 birds, 2,000 reptiles and 10,000 fishes.

THE first copper mine worked in the United States is said to have been in Connecticut in 1709.

Passing Events.

The Legislature has adjourned this week. The Goss hill which the miners wanted passed, as it gave the hydraulic miners a chance to work when they arranged to impound their debris, was not made a law.

The main attention of mining men is just now turned to Northern California. Both Shasta and Trinity counties will be thoroughly prospected this summer. Many men have left for the New River region and others are going by the 1st of April. There is a large section for prospectors to work over in both counties mentioned, and no doubt those who may he disappointed at New River will try other parts of that section, or come over into Shasta county.

The prices of lead and copper still remain low, and the heavy discount on silver still continues to he felt, This is bringing the gold mines to the front, and there is a demand for them among purchasers to a larger extent than has heen the case for some years. This will, without douht, redound to the benefit of California.

THE Northern Pacific is hard at work on its Cascade branch from Ainsworth to New Tacoma, a distance of 200 miles, which will he completed in a year. The war between the Northern Pacific and the Oregon Railway and Navigation Company remains unabated.

Record of California Gold Mines.

There are many gold mines in this State which are paying their owners handsomely, hut which are never heard outside the localities where they are, because they are owned hy private companies. Among these latter, one which is making a good record is the Plymouth Consolidated, owned by a compauy which was formed in June, 1883, by the consolidatiou of the Empire, the Amador, Pacific and Plymouth companies. The mines were well developed, and a considerable amount in dividends had heen paid. Prior to the consolidation, gold, to the amount of $2,500,000 had been produced. Since that time to the 1st of January of this year the mines have yielded $1,714,008.65.

During the year 1884 the company's mines produced $1,033,518, and the operating expenses were $331,163, leaving a profit of $702,354. Twelve monthly dividends of $50,000 each were paid, aggregating $600,000. The surplus over operating expenses and dividends was $102,354, which, added to the surplus of previous year, gives a total surplus of $146,914. The company has no indehtedness whatever.

A good deal of money was expended last year in permanent improvements, principally in changing the motive power from steam to water. This outlay has added largely to the value of the property, and will effect a considerable saving in operating expenses. The water power runs all the the machinery on the property, including the two mills and the hoisting works. Water is supplied from the canals of the company. Steam connections have been retained at the shafts, so in case of accident, a change could he made back to steam at an hour's notice. The water works of the company are very extensive. In addition to the several reservoirs there are canals. The main canal is 25 miles long and runs from the middle fork of the Cosumnes to Plymouth. The South Fork, or Bridgeport, is 20 miles long, and runs from the main fork of Cosumnes river nearly to Plymouth, where it joins the main canal. The Simpson canal is 22 miles, and runs from the south fork of the South Fork of the Cosumnes to the reservoir. The Douglas is 34 miles long, with lateral branches aggregating 15 miles more, and conveys water from middle fork of Cosumnes to Indian Diggings. The Tyler canal runs from the South Fork of Cosumnes to reservoir at Tyler's ranch. In addition to these there are several hranches, and also canals leading the water from Plymouth to the country below, in all about 40 miles, the whole system making a total of 160 miles of canal owned hy the company. The water used for power is brought two and a half miles from the reservoir in an 18-inch iron pipe. At ths Empire and Woolford shafts a pressure of 550 feet is ohtained, and at the Pacific shaft a pressure of 561 feet. The mining timhers are brought to the mines in the canal, saving transportation cost. The improvements have cost about $500,000, in addition to what has heen spent iu developing the mine and in operating expenses. The superintendent, E. L. Montgomery, has had charge of the property since December, 1879, while Wm. Jones, the foreman, has heen at the mines some ten years. J. J. Kerr has directed the affairs of the office at Plymouth for four years.

The property is at Plymouth, Amador county. The company owns a mile of ground on the Mother Lode. The principal mine consists of an immense showing of rihhon quartz, from 30 to 50 feet wide, and 315 to 350 feet loug. The ore mills freely and carries one to two per cent of sulphurets. Chlorination works have heen put up to work them.

There are three shafts; the North and the South, hoth of which follow the vein, and the Pacific shaft, which is vertical. The latter has three compartments, two of them 5x4 feet and the third 5x3½ feet, the excavation being 16x7 feet, carefully timhered with 12x12 in. and 12x14 in. pieces. This shaft is equipped with superior hoisting machinery. Self-dumping automatic skips are used, hoisting 3,000 pounds of rock each, with English flat wire cables. The derrick frame is 76 feet in hight. On the Pacific claim the levels are as follows: No. 1 is 1,060 feet below the surface; No. 2, 1,157 feet; No. 3, 1,237 feet; No. 4, 1,310 feet.

Level No. 5 will he opened during the coming summer. On the Empire the levels are designated according to their depth. The lowest, denominated the 1280 level (the measurement following the North and South shafts which incline), is about 1,100 feet vertical.

Very little trouble is experienced from water. No pump is needed. A hucket running a few hours each day keeps the mine clear.

The two mills have an aggregate of 120 stamps, and are located about 1,000 feet apart. The Empire mill has 80 stamps, and the Pacific 40. The latter are the heavier, weighing 900 pounds each. Both mills are in excellent condition, and together are crushing about 250 tons of rock daily. Connected with the mills are 40 Frue Concentrators for saving sulphurets.

A matter of interest to many miners will he to see at what small cost the mining and milling, particularly the latter, is carried on. Duriug the year, hoth mills have been run with regularity, crushing in the aggregate about *eighty thousand* tons of ore. The average yield of gold was $13 to the ton. Deducting from the operating expenses the value of material on hand, and unusual outlay in reconstructing Empire Mill, etc., the cost of production is shown to be as follows:

	Per ton.
Cost of mining	$3 20
Cost of milling	48
	$3 58
Add cost of saving and reducing sulphurets	21
Total average cost	$3 89

This company is now paying larger dividends than any gold mine in North America. The country ahout Plymouth where the mines are situated is quite unlike that of most mining sections. Instead of harren rock or desert, there are fine farms, vegetahle gardens, cultivated fields and pleasant woods, making it desirahle for residence. It is in the foothills of the Sierra, 900 feet ahove sea level, comfortahle in summer and not too cold in winter. Notwithstanding too great depth the mines are looking hetter than at any previous period of their history.

Mica.

One of the most abundant minerals in Nature is mica, as it is found disseminated in small particles in many of the common rocks. Commercially, however, it is of no value unless found alone, and in sheets of good size; and, moreover, these sheets must he clear and free from stains. Miners are apt to think that sheet mica is rare and valuahle, which is by no means the case. One mine in North Carolina produces ahout all that is used in the United States, and its owners control the market. The blocks from which the sheets are split are large, and the sheets are clear and white. Stove manufacturers and others prefer to huy sheets of standard sizes trimmed ready for use, so that miscellaneous lots do not stand much chance in the market.

It is for these reasons that none of the many deposits found on this coast have ever proved profitahle. The purchasers want a certain kind and certain sizes, conditions which the owners of these claims did not fulfill. Therefore they did not get the prices anticipated, and the enterprises fell through.

There have been sent to this office at different times during the past ten years, very many samples of mica, most of them, however, of comparatively inferior quality; that is when we take into consideration the really fine quality of known worked deposits. None of the mines here have, for some reason, ever heen opened to any great depth so as to really find out their value. It might be that when opened properly the quality of the product would he of an improved character, and such as would make it readily marketable.

The following include the principal localities at which this mineral has heen found in California: At Gold Lake, Plumas county; in El Dorado county; Ivanpah district, San Bernardino county; near Susanville, Lassen county; and at Tehachapi Pass, Kern county; it having heen observed at many other places in the State. As little or no work has been done on any of these deposits, not much can he said in regard to their probahle value, one way or the other. We have reports of mica heing found in nearly all the Pacific States and Territories; also in those contiguous to the Rocky mountains; its occurrence in some of these heing abundant, and extending to many different localities.

PLENTY of water has been struck at Quijotoa. The mill will soon be up.

Sanitary Engineering.

This is a hranch of the profession of civil engineering, which has only heen recognized of late, but it is destined to become more prominent in the future, and to he better appreciated. The ventilation and warming of huildings, sewerage, drainage, etc., are all questions of every day life that should be intelligently considered hy trained men, and not left to mere workmen who have only slight knowledge of the principles involved in carrying out good work. We frequently read accounts of elahorate arrangements for the ventilation of some large building which are to result in perfection, hut which, when put to the test, prove an utter failure; draughts exist in all directions, and the places are alternately too hot or too cold. As regards our private dwellings, the discomforts of defective warming and ventilating are still more apparent. It is seldom found possible to maintain an ordinary room at an even temperature; elaborate means are sometimes provided for the exit of foul air, but, heyond the cracks of doors or windows, no provision is made for a supply of fresh air, the natural result heing "down draughts" by ventilators and chimneys through which the vitiated air should he passing away.

Then as to drainage, although in the present day we are fully alive to the necessity of providing means for the quick and efficient removal of sewage and dirty water from our houses, and, although this is perhaps fairly well carried out in modern houses of the best class, yet it is rarely attended to in the great majority of dwellings. The drains are frequently laid so as to afford lodgments for solids passing into them, and ventilating pipes, if they are provided, rather convey a supply of foul air from the drains into the house than take it away, and, in the large majority of houses, the same water cistern serves for the closet and for drinking purposes. These and many other evils have been pointed out from time to time by sanitary engineers, hut stingy owners and apathetic or ignorant occupiers do not recognize them as they should. There should be laws for enforcing a proper care of sanitary arrangements in houses. There are many questions for sanitary engineers to deal with, and their skill should he more frequently brought into practice than is the case.

Estimation of Slags.

In the early stage of smelting at Leadville great difficulties were encountered at most of the works in making a good slag, and the "muscular" method was frequently adopted to free the furnaces from sows. This evil was in great part due to disregarding the alumina contained in the ore, and also to the manganese which was not regularly determined on account of the tedious methods then in use. The result of this oversight was a very hasic slag which would naturally close up the furnaces. Mr. T. Macfarlane in a paper read hefore the American Institute of Mining Engineers, suggested that by determining the specific gravity of a slag a clue might be found for improving it, if not correct. If the specific gravity was higher than the typical slag, this would prove an excess of the hases of the heavy metal in the faulty one. But whether it required an addition of lime, or silica or hoth, the determination of the specific gravity could not show. In the case of a slag which is far out of the way, correct chemical analysis alone can give us information, but this involves delay. Since the introduction of more rapid volumetric methods for the determination of manganese, and the estimation of alumina or slag computations, all trouhles of this nature have ceased. A fact to which Dr. Iles, of the Grant Smelting works first called attention, and which Mr. O. H. Hahn thinks might be turned to account in correcting a slag, is the behavior of its powder under the magnet. Some slags are highly magnetic, while others are not. This would seem to indicate that magnetic oxide is dissolved in the slag which has escaped reduction to ferrous oxide, and this causes a waste of precious flux.

DURING the recent warm spell some of the placer miners in the Little Rockies washed out $7 and $8 worth of gold dust per day.

FIFTEEN men are employed in getting out ore in Cerro Gordo, Inyo county, which is shipped to this city for reduction.

New Single-Acting Engine.

We illustrate on this page a single-acting engine made by the San Francisco Tool Company, at First and Stevenson streets, in this city. This engine is fitted with a piston valve between the cylinders, and corresponds in most respects to the Elwell and Packer or Chandler type made in England. It is proposed, however, to abandon the piston valve and some other features in a new set of designs now being prepared. An oscillating valve will be employed on the larger sizes, and a rotary valve on the smaller sizes.

These engines, which have come to the front mainly through the Westinghouse Engine Co., of Pittsburg, are an American invention, beginning with what was called the Hicks' engine at New York about twenty years ago. For some strange reason the art, so to call it, has been abandoned here and taken up in England, where for twelve years past such engines have been made. There are now at least seven firms in Great Britain making single-acting engines. The principles or method of their operation is quite simple, and there is no departure from common practice, at least none that should class the engines with the rotary or other irregular modifications.

Instead of one, two cylinders are employed and steam used in one end only of each. This causes all strain to fall in one direction and dispenses with play or lost motion. The cranks are enclosed in a close casing, and this being partially filled with oil, the latter is "dashed" into all bearings, and also into the cylinders, so that lubrication in the common sense is dispensed with. There are no packing glands about the engines, and their speed can be twice as great as that of double acting engines.

The Hicks' Engine before named contained nearly all the main elements of single acting engines as now made, the principal difference being that the pistons here arranged to perform the functions of valves, and the exhaust steam has been allowed to escape into the crank chamber. Willan's engines, the next of any importance to follow here, were invented in London at the works of the celebrated shipbuilders, John Penn & Sons, Mr. Willan being employed there. The Willan engine is one of the most complete to this time, and is now made with compound cylinders when economy demands it.

Some of the main proportions employed by the San Francisco Tool Company are as follows:

D = diameter of the cylinders in inches.
d = area of cylinders in inches.

Stroke of engine	D
Diameter of main bearings	D × .4
Diameter of crank pins	D × .4
Diameter of top pins	D × .3
Length of main bearings	D × 1.2
Length of pistons	D × 1.25
Width of connection bearings	D × .5
Length of connections	D × .3
Area of parts	d-.10

We will in succeeding numbers of the PRESS, publish further views of these engines with sectional drawings to show the arrangement of the working parts.

The New River Country.

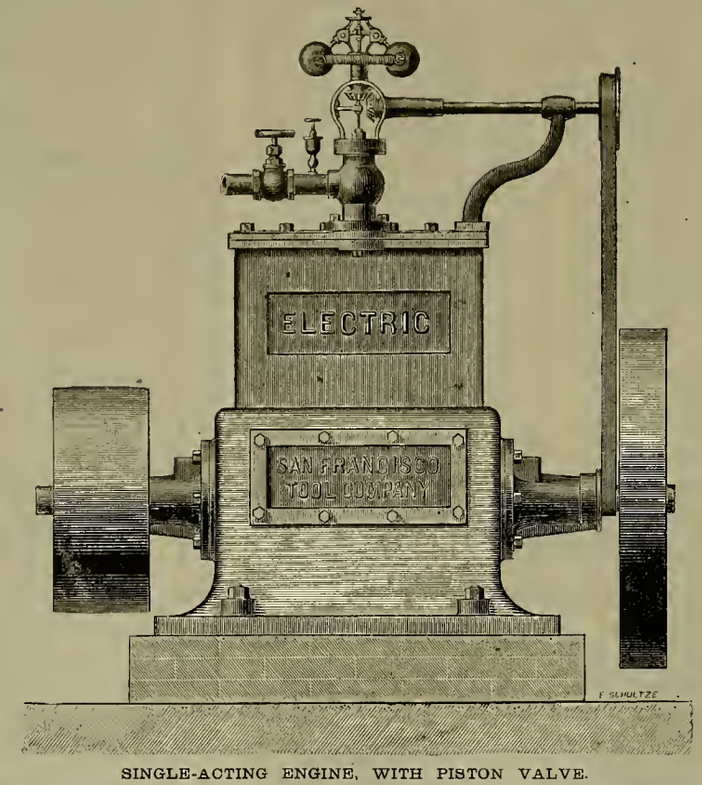
Although rather early in the season, a good many people appear to be going into this section of Trinity county, from which accounts continue favorable. Operations on the wagon road projected from Humboldt Bay to New River, are being prosecuted vigorously; such being the confidence of the business community up there in these mines that ample means have been provided to insure the completion of the road at an early day. As this road will be some 65 or 70 miles long, and its construction will call for an average expenditure of $1000 per mile, the parties undertaking it may fairly claim to have proved their faith in New River by their works. Stages are already running over a portion of the route, and will probably be able to make the entire distance in the course of two or three months, perhaps much earlier. It is stated that horsemen and even footmen can now go from Eureka to Humboldt Bay to New River without any difficulty, there being good accommodations on the way.

THE Horn Silver mine of Utah is producing as usual, but there is no disposition to increase the supply of lead or silver, owing to the present depression in these articles.

JOHN W. Mackay will shortly arrive in California.

Heat in Amalgamating Pans.

J. H. Bidwell, of Ivanpah, Cal., has patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an amalgamating pan, which is so constructed that the temperature of the contents may at any moment be decided without uncovering the pan or encountering the mercury or steam exuding therefrom. The inventor claims that an excess of heat in the pan destroys a large percentage of the mercury, while too low a temperature interferes with the economical extraction of the gold and silver. The temperature, as a rule, is merely guessed at, as it is not practicable to introduce a thermometer into the agitated pulp. Under this invention a bulb is introduced into the pan, which in turn is connected with a pipe that passes through the side of the pan and terminates in an upward projecting arm. The bulb and pipe are filled with mercury, and a peculiar shaped thermometer, made expressly for this invention, is introduced into the bulb through the pipe, and can be so arranged as to have the scale of the thermometer either upon the side or top of the pan. This invention has been in use at the mill at Ivanpah for some time, and it is found to be of great benefit both as to the saving of quicksilver and silver. It has happened that



SINGLE-ACTING ENGINE, WITH PISTON VALVE.

as much as 50 pounds of quicksilver has been lost by heating pans five degrees too hot, and in the same ore ten per cent of silver has been lost by not heating it enough by five degrees. The fact is there is no ore but that will work better at some certain degree of heat, and it cannot be guessed at by 15 or 20 degrees. Mr. Bidwell's invention, it will be seen, is a very important one, and is destined to save large amounts to the mining industry.

BULLION CROPPINGS.—A party of miners have obtained from the Bullion Company the privilege of working the croppings or old upper levels of the mine on tribute. They have begun operations, and are now engaged in clearing out the old Cresus shaft, sunk in the early days of the Comstock, and which is nearly 500 feet in depth. Drifts will be started to the west from different levels in the shaft, and run into the croppings. The shaft through which they are working bears an auspicious name.—*Enterprise.*

ABOUT 12,000 cords of wood will be driven down the Carson river, during the coming season. This is about the average drive of late years, but in earlier times, when most of the ore crushing was done by steam mills in Storey county instead of by water mills on the Carson river, as much as 180,000 cords were sent down in one season.

CONSIDERABLE prospecting is going on in southern Oregon at present.

Calico District.

[From Our Traveling Correspondent.]

The District of Calico has been given more or less notice in the coast papers of late. The information, however, has been confined to strikes, output or local mention, and has not been accompanied by the necessary details to properly enlighten one at a distance as to the camp's claims as a silver producing district, formations, etc. The expert who visits Calico for the purpose of correctly describing the formations, analyzing the indications, and predicting, with the least certainty its future, will find himself up a tree, so to speak.

Strange Formations.

It has been said of man: "Thou art fearfully and wonderfully made." Man is not a circumstance in comparison with the formations and composition of this district. The mountain range, across the southwest face of which the mineral belt lies, is a strange commingling of strata and mounds of many-colored formations; hence the name of Calico. The district is from one to three miles wide and about eight miles in length. The mountain is barren of vegetation is rugged and cinder-like in appearance. The hills indicate having passed through a volcanic tussle that left them in a condition strangely at variance with nature and perplexingly mysterious to the average mining expert. Porphyry, spar, porous quartz, sandstone and sedimentary formations constitute the principal argentiferous orea of the district, spar veins predominating and yielding the highest grade.

Irregular Vein Matter.

There is little or no regularity in veins. No true fissures have been found nor is it reasonable to expect the existence of any, unless it be at a great depth. Slides, broken masses of sedimentary matter, birds-eye porphyry, spar veins and country rock, abounding in pockety ore-chambers and chimney-like deposits of ores that assay from $10 to thousands per ton, is the order rather than the exception of things. The ores are all free milling. Owing to the non-existence of water or any moisture whatever, little or no timbering is required. The broken up and irregular formation, in most parts of the district, necessitates less powder than is usually used in silver mining districts.

The Mines.

The district rules prescribe the size of a claim to be 1200x600, being 300 feet on each side of the vein. The entire belt has been gobbled up, some of it a number of times, and the usual litigation characteristic of a new camp, make work for the courts. The majority of the district is held by locators who are non-residents, or miners who lack capital to properly or successfully develop a silver mine. Prospectors and mine owners here, as always is the case, want thousands for their prospect holes and thus keep out capital that is ready and anxious to pay fair prices and develop the good mines. There is not a patented claim in the district, and until order and satisfactory adherence to location laws are better established, titles to property will be questionable.

Tribute Miners.

Men who work a mine or part of a mine, taking the proceeds as wages, after royalty deducted, but who work under the direction of the owners, and hold no possession or title as lessees, are legion here. With the exception of a few companies, all the mines are worked by chloriders or tributers. Small claim owners, working their own ground, come under that head in this case. These men furnish their own supplies, extract, sort and sack the ores. Freighters haul it to a custom mill or to the sampling works at Daggett, some five miles distant, charging them $4.50 per ton. They take out from one to five tons per day, according to the number of men at work or the character of the ground and ore in which they are at work. The following schedule of prices paid for ores delivered at the railroad station at Daggett, will inform the mining man what can be realized by tributers:

Oz. Ore.	Cents per Oz.	Price per Ton.
40	48.19	$ 19.27
50	53.98	27.00
60	58.81	35.28
70	62.65	43.85
80	65.54	52.43
90	67.47	60.78
100	69.40	69.40
150	73.20	109.81
200	77.19	154.20
250	78.08	195.20
300		246.36

The Silver King.

To know the King is to know the district. The mine is properly named, and is all that the name implies, in the way of a bullion producer and dividend-paying bonanza. The mine is owned by Milwaukee, Wisconsin capitalists—C. M. Sanger, president, and C. T. Bradley, treasurer. The superintendent, Mr. D. Bahten, is a thorough miner, a progressive, systematic and economical manager, and is familiar with the many and perplexing formations of the entire district. The mine is paying monthly dividends of from $15,000 to $30,000 per month. Since January 1, '84, over $1,000,000 in silver bars have been shipped from their mill, all of which was taken from the King. The Silver King is situated at the head of Main street, in Calico, is 1,200 feet long, and is so shaped as to be 400 feet wide at the north end, and 150 feet at the south. The company own the Queen, and control the Moscow and Little Bonanza on the north, and own the Snow Bird in East Calico. A well defined foot-wall extends across the face of the King grounds, cropping out near the top of the claim, no great distance from the summit of the mountain. In keeping with other strange features of the district, the wall dips with the hill, and not into it like should naturally do. The dip is about 70 degrees, while the surface is about 40. A winze has been sunk on the wall from the first to the sixth level; a 415-foot tunnel from the surface taps the wall on this level. A winze at each end of a 200-foot drift on the foot-wall, each side of the tunnel, connects with the seventh and eighth levels, and one winze goes still 50 feet below the eighth, making a depth of 550 feet reached on the foot-wall.

Development of Ore Bodies.

The richest ores of the King have been taken from porphyry and spar veins of irregular shape and uncertain length and thickness. Some of the country rock also has been found to be more or less mineralized. Chamber, bunch and pocket deposits have been and are being discovered daily, notwithstanding the uncertainty of the veins' permanency, as rich and higher grade ores have been found often but a few feet from where lost, and in formations that puzzles the miner to account for the existence of such strongly congenial, geological neighbors. Ores running from $15 to $45 are mixed, and the many rich antimonial and horn silver pockets make the average run from $30 to $45. The company's mill is at Daggett, seven miles distance. Two 20-mule-teams of three wagons, each deliver 60 tons of ore daily at a cost of $2.50 per ton. The cost of mining, hauling, milling and discount is about $18 per ton. The tunnels, drifts, stopes and winze excavations will measure nearly a mile. The air is good, though somewhat warm in the deeper levels. A whim, to be run by horse-power, is to be put in on the sixth level west of the main tunnel. The work throughout the mine is done mostly single-handed, more than one man in the breast of a tunnel or drift being an exception. About 40 assays per day are made in keeping track of the different vein matter and ores taken out.

Wages and Supplies.

This company pays $3.50 per day, working nine hour shifts night and day week days and even Sundays. Men are at liberty to board where they please, promptness and sobriety only being required by the company. The warmer levels assist in consuming an extra number of candles, about one ton per month being used. The water supply for drilling and drinking purposes is quite an item in the monthly expense bill. There is a great deal of dust in the main tunnels and drifts, and an ore car raises a cloud in its passage in and out, that the uninitiated would think must be unhealthful to miners. The timber for lagen, posts, chutes, skids and tramways is brought from Flagstaff, Arizona, and the cost is no small item. Miners receive their pay from the first to the tenth of each month and something like $20,000 is paid out in Calico every month.

West Calico Mines.

The leading mine is the Sue. The claims of the company lie northwest of the Silver King, and they claim to have formations and ores similar in character and richness to the King.

(*Concluded on page 180.*)

Concerning Strikes.

The country is now experiencing its periodical epidemic of strikes. The continued hostile attitude of the Hocking Valley miners, the strike of the employees of an agricultural establishment at South Bend, and the iron-workers of this city and at various other points, may be regarded as symptoms of a general dissatisfaction among the laboring classes throughout the country. Fortunately the trouble in this city has been settled amicably for the present at least.

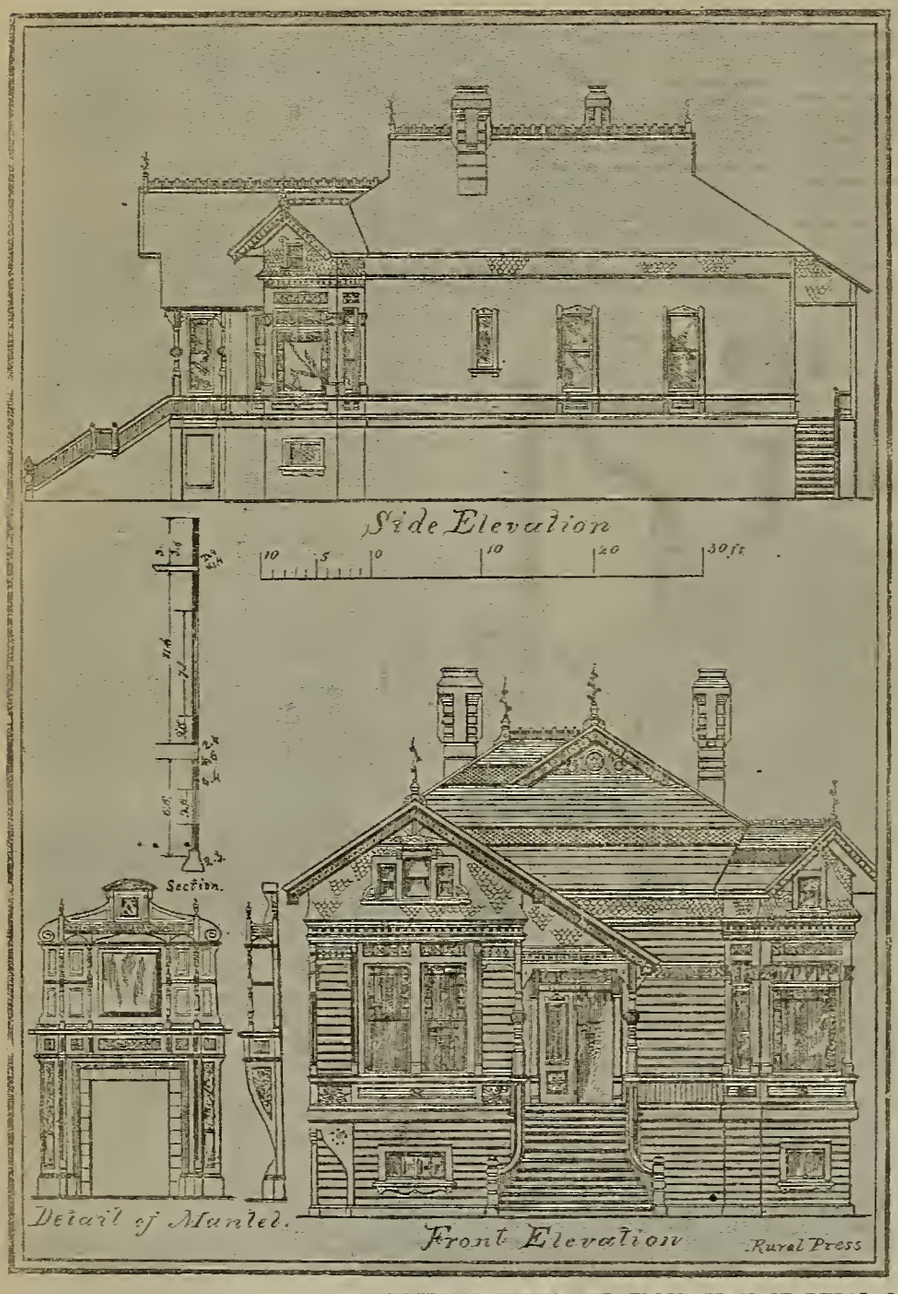
There is, indeed, something pathetic in a strike to resist what would seem to be a cruel and unnecessary reduction of wages that touches the general heart of sympathy; but there is a time when strikes are fatuous and almost certain to end in failure. When there is a general depression in business, when profits disappear and capital is running at a disadvantage, the wages of the laborer must share with the employer's losses. They must be adjusted to the downward slide. This is absolutely necessary in order to keep business going. To organize a strike to keep wages up in such a state of things is injudicious, for it is almost sure to result in a retrenchment or stoppage of business and general distress. As the cause of the depression is universal, a change of place in search of employment offers little or no encouragement. And yet very much of the distress and disaster that laboring men bring upon themselves is owing to the fact that they blindly follow leaders who fail to study the indicators of the temperature of trade. Labor, like any other article in the market, is governed by the law of demand and supply. When it is scarce, wages are high; when it is in excess of demand, as it usually is in hard times, the prices fall, and any attempt to enforce a fixed and uniform standard through all the fluctuations of trade is simply fighting the inevitable. And yet, strange to say, this is one of the frequent blunders of the trade-unions that the men are "ordered out" on a falling market, when the "bosses" are well-nigh indifferent whether the works shut down or not, and when at the worst strikes can be of no serious detriment to them. Indeed, they are often so glad of an excuse to curtail or temporarily suspend business as to create the suspicion that they find ways to mislead the judgment or tamper with the integrity of the leaders of the guilds.

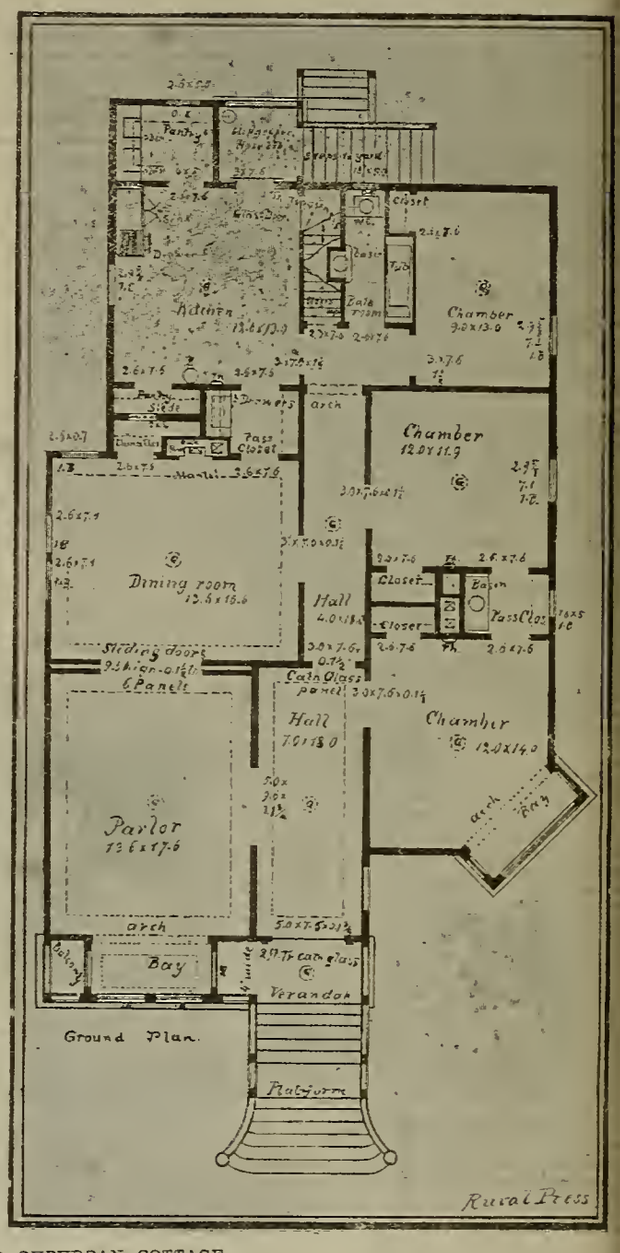
But when business is active and profits are advancing, the laborer certainly has a right to share in the thrill of prosperity. Some employers are apt to be slow in recognizing this right. They may be anxious to make up for the losses of former depressions, or may be inclined to regard the wave of prosperity as uncertain and temporary. Others are careless, indifferent or too stupid to realize that with an increase in business comes an increase in the prices of living: and a few may be too cold, hard and selfish to do anything towards lightening the burdens of the laborer. Under such circumstances working men are forced to combine for a readjustment of wages, and are justifiable in so doing and usually succeed. Employers cannot afford to pause, daily or stop work; the demands are urgent and the profits too great. Then the general increase in business opens fine opportunities for workmen elsewhere, and it would not do to higgle with them very sharply as it would be difficult to supply their places should they get petulant and leave.

When laborers strike for higher wages because they cannot subsist on what they have been receiving, they are sure to have the sympathy of the community; but when, as in the case of the Hocking Valley miners, they strike in obedience to the arbitrary and unreasonable commands of their leaders, or, perhaps, the league, the insurrection of labor against capital loses much of its pathetic aspect. The miners were receiving good wages, but the rules of the Miners' Association are, that if a capitalist makes a profit of more than twenty-five cents per ton, he must share one-half of the excess among the laborers. The miners were not in want. The capitalists were supposed to be making more than twenty-five cents a ton. They struck for a division of the profits in excess of twenty-five cents per ton. Had the capitalists only been making twenty-five cents a ton, they would have remained satisfied. Now, if this is a correct statement of the case, it is a principle of industrial economy that is, at least, questionable. Strikes for an advance of wages, or even against a reasonable reduction on a falling market are of doubtful expediency, but under no circumstances are they justifiable in order to compel a division of the profits. It is an arbitrary and despotic proceeding that smacks of the worst phase of communism. There is not the shadow of just principle involved. The Miners' Association says that fifty cents a ton is good wages for the miner, and that twenty-five cents a ton is good enough profit for the mine owner. Now, if this is so, then if the capitalist makes forty cents per ton after paying the miner his fifty cents per ton, the extra fifteen cents per ton does not belong to either of them, but to the consumer. This introduces a third element into the equation which the laborer seems not to have duly considered. In striking for one-half of this extra profit they strike for a share in unjust plunder: they seek to become partners in wrong along with the capitalist. If, instead of striking for a share of the plunder, they struck to make the capitalist sell cheaper to the poor consumers in our large towns and cities, there might be a show of plausibility in the undertaking. But they strike for themselves, not humanity; for more money, not for a better state of society; not because labor was poorly paid, but because they are as unscrupulous as the capitalist, and would have an interest in his extortionate gains. We speak of the Miners' Association, for the rule sought to be established there is sought to be established in other industrial enterprises.

No, not in this way can the ugly chasm between labor and capital be bridged. The capitalist will continue as grasping as ever, and the laborer suffer the bitterness of defeat. Some other method of disposing of the controversy must be discovered. The appeal to brute force has always proved weak and unfortunate. More intelligence, far-sightedness, mutual justice and kindness must solve this problem if it is ever solved. W.

TIMBERING IN A BOTTLE.—In Frank Frederick's window is a curiosity that shows the mechanical ingenuity, patience and perseverance of man. A large bottle, with a very small neck, contains an illustration of how timbers are put up in the stopes of the Comstock mines. The floor, sills, posts in fact everything that can be seen in a mine can be seen in the bottle. All the pieces are carefully and mechanically joined and it must have taken a world of patience to have placed everything through the neck of the bottle and then fastened the same together. It is the work of a carpenter at the Union, named Willeson, and will be sent to the New Orleans Exposition by C. C. Thomas. It will remain here a few days, and it is well worth while for a person to take a look at it.—*Virginia Enterprise.*





EXTERIOR VIEWS AND FLOOR PLAN OF RURAL OR SUBURBAN COTTAGE.

Cottage Design.

We give on this page a cottage design, front and side view and floor plan, of a beautiful cottage, suitable for a rural or suburban situation. The design is reproduced from the new architectural work entitled "Picturesque Californian Homes." by Samuel and J. C. Newson, architects, San Francisco, which we offer to our subscribers on very favorable terms. It has many designs, and something can be found in it to suit nearly all tastes and purses.

HAD all the silver produced by the mines of the United States been coined into standard dollars for the last fiscal year, it would not have added more to the specie circulation of our people than seventy cents per head of our whole population.

Engineering Notes.

The Sukkur Bridge.

The Sukkur Bridge, India, contract, the ondon, *Engineer* says, has been let to lessrs. Westwood & Bailie, Isle of Dogs. bout a year ago this bridge was offered for ender, with the extraordinary condition that ie immense cantilevers were to be erected for spection at the works of the maker in Engnd. Few makers were able to tender in this ay; but some of the more enterprising offered o take the responsibility of the work going ogether properly in India by erecting it at the te. The business was postponed till now, ending communication with India. The authorities there prefer to erect the bridge themselves, f, therefore, the original plan of erecting at he factory be carried out, the cantilevers will resent a somewhat startling spectacle on the anks of the Thames. It will be interestiug to ote if Mr. Roudel will carry out the design as was described last year. It is, however, lmost impossible that such a hideous thing ill pass into actuality without important modfications: but in any case the Sukkur Bridge, ven as far as it has yet gone, is an illustration f the way England is officially committed to he greatest barbarisms of design when design s thrust upon officials as a matter of routine, nstead of being solicited from those who have pecial talent in the work to be done. Moreover, if it becomes necessary to erect all the ew bridges in the factory yard, bridge builders ill have to buy a county for erecting room, to ay nothing of the enormous extra cost and aste of money. Perhaps, however, the designrs will learn to predicate the capability of their ridges to stand without erecting them twice.

A New Style of Paving Block is composed f a hollow iron shell filled with any desired oncrete. The shells are arched underneath, nd for street paving are about 4 inches wide nd from 10 to 12 inches long. The blocks, or lled shells, are laid against each other upon he prepared roadbed, and the form of the botom compacts the sand underneath, making the hole structure very firm and solid. The surace of a street paved with these blocks would e about as smooth as if paved with asphalt, nd it is claimed, apparently with good reason, hat the pavement is much more durable if the oncrete should become broken upon its upper urface the wheel could only wear it away to a epth of less than a quarter of an inch, as at very interval of four inches there would be preented a surface of chilled iron upon which the ire would ride all the time. We have before eard it suggested that iron would make a good avement for streets, but the invention we have oticed is the first practical attempt to use it or that purpose of which we have any knowldge. The patents upon this paving block are wned by a company in a Western city.—*Am. Manufacturer.*

Ocean Cables.—To lay a cable across the Atlantic is an enterprise which requires skill as well as capital. So many obstacles have to be ncountered, and so many accidents are liable o happen, that the risks of cable-laying, when onsidered, appear formidable. For instance, he steamer *Faraday*, which is used to place he cable, costs $5,000 per day. One of the ables laid by Messrs. John W. Mackay and ames Gordon Bennett, divided, and this vessel as employed six weeks in grappling for it before the ends could be secured and spliced. It s stated in an Eastern journal that Mr. Bennett's share in the venture has required $7,300,000. Presumably, Mr. Mackay has got as much in the enterprise.

A Canal Across Michigan.—A canal is proposed across the lower portion of Michigan, to connect the waters of Lake Michigan with those of the Detroit river. A hill has been reported favorably in Congress appropriating $10,000 for the preliminary survey. The distance between the lake and the river is 178 miles. Mr. Henry Willis, who was connected with the construction of the Pennsylvania canals estimates the cost of the proposed water route at $4,754,860. He says the distance saved between Detroit and Chicago by a canal would be 535 miles, and that an annual loss of between $2,000,000 and $3,000,000 now incurred by commerce upon the lakes would be avoided.

About the most remarkable piece of engineering work that has come under our notice lately was a steam boiler set in sandstone. The blocks of stone were neatly dressed, and the work looked very fine outside, but the furnace, and the pier supporting the back end of the boiler, seemed to be in about the same condition that the eggs were in at a certain hotel where a guest ordered them poached, and the waiter strongly advised him to have them scrambled, "for," said he, "them aigs ain't very fresh, boss, and dey *look* better scrambled!"—*Locomotive.*

A General Subway.—It is proposed to build a general subway under all the principal streets of London. The cost of such an enterprise would be considerable, but the benefits derived from it would, in the end, more than pay the cost. The architectural and scientific papers speak approvingly of the scheme.

Useful Information.

Castor Oil for Shoe Leather.—There is one simple article which will render any decently made boot thoroughly impervious. It is nothing more nor less than cold-drawn castor oil, "pure and simple." It is best applied before a moderate fire. The boots to be dressed should be quite clean and dry, and special care should be given to the welt and the tongues, and their stitching to the upper leathers. I generally begin by pouring the oil from the bottle all around the welt so that the angle between the sole and upper leather is quite filled with oil, and then proceed all over the boot, including the edges of the soles, rubbing it in with the hand. When one is done, have a turn at the other, and so alternately till you have got in about a tablespoonful and a half to each boot. The tongues being thinner leather, should be quite saturated. Subsequent dressing will not require so much oil. I have never found anything to touch this as a waterproof dressing; the gelatinous oil seems to effectually stop every pore in the leather. There is no other advantage for those who are natty in such matters—the boots will soon take a good (common blacking) polish—so much so that a man may, if he likes, waterproof his ordinary walking boots for bad weather without spoiling their appearance. With a common walking boot of ordinary thickness apply the oil over the sole. Shooting, I wear boots so treated over thick woolen socks, from eight to twelve hours a day, or more, without feeling the slightest inconvenience in any way; but they have the chilly feel inseparable from all boots that are oiled in that way.

Common Sense Ventilation.—The best practical statement we have met with about ventilation is contained in the following remarks of a mining engineer: "Air is like a rope; you can pull it better than you can push it. All mechanical appliances for pushing air into a room or house are disappointing. What we need to do is to pull out the vitiated air already in the room; the fresh supply will take care of itself if means for its admission are provided. It has been usual to withdraw the air through openiugs near the ceiling—that is, to carry off the warmer and therefore lighter portions, leaving the colder strata at the bottom of the room, with their gradual accumulation of cooled carbonic acid undisturbed. Much the better plan would be to draw this lower air out from a point near the floor, allowing the upper and warmer portions to descend and take its place. An open fire, with a large chimney throat, is the best ventilator for any room; the one half or two thirds of the heat carried up the chimney is the price paid for immunity from disease; and large though this seems, from its daily draft on the woodpile or coalbin, it is trifling when compared with doctors' hills, and with the loss of strength and efficiency that invariably result from living in unventilated apartments."

A Human Furnace.—The Gridley *Herald* states that a tramp recently entered that office, who said he was known in side-show circles as "The Human Furnace," because of the peculiar properties of his breath. To prove his claim to the title he lit a match by blowing his breath on it; set fire to a piece of paper, and singed the hairs on the back of our foreman's hand in the same manner. But the best test of all was when he lit a kerosene lamp three feet distant from him by blowing his breath through a piece of stovepipe on to the wick. He was unable to explain his peculiar faculty, further than to assert that he became possessed of it while a child, when he was ill for several years, and the physicians gave him large doses of sulphur.

A Living Infernal Machine.—The San Diego *Sun* relates a very extraordinary occurrence which took place recently at the residence of one of the prominent citizens of that city. The family were sitting in the parlor, in the evening, when a bug was seen crawling on the table. One of those present seized the insect and placed it in the lamp, with the view of cremating it. A loud report was instantly heard, and the lamp chimney was blown to atoms. The explosion was certainly connected with the insect, but in what manner, says the *Sun*, we leave to scientists to explain.

How Bricks are Handled in Germany.—There are no hod-carriers in Germany. Bricks are passed from hand to hand. The higher up the bricklayers are, the more men are required to toss the bricks. Two men to a story is about the average, with enough more to lead from the front of the building to the place where the bricks are needed. One may sometimes see three men on the ground, eight on the front of the building and five on top, making sixteen men through whose hands each brick passed before it reached its place of destination.

Gun Cotton as a Motive Power.—An application of gun cotton is said to have been made in such a manner that it will eventually supersede the use of steam for the purposes of light locomotion and driving small machinery. Details of the invention are not yet made public.

Antimony in Clothing.—Among other poisonous substances used in dyeing is antimony. A French industrial journal records the fact that an appreciable quantity of this mineral is often found in cotton yarn, which is dyed with aniline colors, and remarks that unless great care has been taken in cleansing the yarn, it is possible for such a quantity to remain, as to be seriously injurious to the skin, especially in the case of stocking and any other aniline-dyed garments which may be worn in contact with the skin.

The Most Nutritious Grass. Chemical analysis shows blue grass (*Poa Pratensis*) to be the most nutritious of all the grasses. According to this test, five pounds of blue grass contain as much flesh and bone-producing elements as 10 pounds of timothy, 6 pounds of red top, or 6 pounds of orchard grass. Owing to the much greater yield of the latter, however, it is undoubtedly the most profitable that can be grown upon soils adapted to its production.

Compressed Camphor is made by Wm. F. Sines & Son, patentees, Philadelphia. Refined camphor compressed into one-ounce cakes rendered compact and solid, which prevents rapid evaporation, are handy for dispensing. Refined flowers of camphor remains in fine powder is what is wanted for manufacturing purposes and dispensing. Packed in air-tight packages for home and export trade.

A New Porcelain. Mr. Lauth, the superintendent of the porcelain factory at Sevres, is said to have discovered a new porcelain, which is far superior to the celebrated old Sevres. After ten years' experiment and investigation, he thinks he has produced a porcelain identical with that of China. Not only does it lend itself to artistic decoration, but it takes all kinds of glazes, and surpasses in beauty the colors obtained in China.

A Foot-Warmer for railway carriages, heated electrically, is being tried in France. The system is devised by M. Em. Concallas and M. Aeph Elu, the heat being produced by a current passing through lead plates transversely arranged in the ordinary foot-warmer. In the recent trials which have taken place, the current was developed by a Gramme machine and traversed five foot-warmers.

Discarding the Horse Bit.—It is said that Australians have discarded the horse bit, and substituted for it a contrivance, consisting of a steel band placed over the front bone of a horse's nose, to which appliance the reins are attached. It is claimed for this substitute for the bit that it gives complete control over the horse, without inflicting the least discomfort or torture.

Good Health.

That Sanitary Inspectorship.

Editors Press:—It is a very odd thing that with all our professed affection for our children we really take so little care of them. When a plague threatens our orchards we raise a breeze strong enough to start the legislative windmill, and a crop of hug inspectors results. Sheep get scabby, and scab inspectors are called for. But our

Children Get Poisoned

By the thousand, and hardly a voice is raised to suggest an inquiry; let alone any mention of appointing an inspector to abate the death-dealiug nuisances whence the poison emanates.

The fact is we are miserably miserly and selfish. Our sheep have a cash value; our orchards have a cash value; so we can't suffer them to perish. Our children are a source of expense, and call for parental self-denial, so our women "doctor," and unnaturally wrong the unborn, and our babies are "soothed" to death with some cursed "syrup;" or a filthy privy, as "I. H." writes, and as I have written dozens of times, poisons air and water alike, breeding diphtheria and zymotic diseases innumerable.

Let our legislature now convened signalize its session by appointing a "Sanitary Inspector" and making it criminal to poison God's air and water with filthy cesspools.

Edward Berwick.

Laying Down Rules of Life.

A thoughtful writer in the *Herald of Health* observes: "It really seems sometimes as if hygienic science were all wrong, and as if late hours, much hard work done under the gas-light, and the smallest amount of fresh air were the way to be healthy, if not wealthy and wise. Who lives under more unhealthy conditions than our legislators or the leading counsel learned in the law? But our statesmen are in a green old age at 75, and lawyers are quite boyish at 60; so, too, are actors and actresses." Our contemporary then goes on to say. "Sanitary guides should tell us the meaniug of these things."

"So far as we may presume to respond to this appeal," replies a physician in the same useful journal, "we must be allowed to point out, first, that there is a fallacy in the inference that because members of Congress, busy counsel, and, perhaps, actors and actresses, live on in spite of the adverse influences of surroundings which are held to be injurious to health, therefore the surroundings of their lives cannot be as injurious as they are supposed to be.

"One of the earliest exploits in the applied science of statistics as brought to bear upon sanitary questions was the drawing of an inference that, because the London night men, who slept as they might by day, and spent the hours in darkness in emptying cesspools, were able, as a class, to claim a low rate of mortality, their mode of life and the work in which they were engaged could not be unhealthy. A good deal of excitement, we remember, was produced by this delivery some 40 years ago. It was forgotten that another point of view was possible, and that, in truth, none but the inured could live under such conditions! So it is with members of Congress, busy counsel and actors and actresses. The weakly and sensitive retire or die, or have the wit not to enter into a way of life which must obviously prove unsuitable. At the same time, we are quite prepared to meet our contemporary half way in his argument, though the inference with which he opens the debate is obviously faulty.

"We think a great deal of unpractical nonsense is talked and written on the conditions of health, and we are quite sensible of the fact that that regimen and dieting may be carried too far. Practitioners and those who set themselves up as apostles of sanitary science are too prone to measure other people's corn by their own bushel. For example, a physician or surgeon may himself have been a too free liver—it is easier to preach than to practice—and he may have become a vegetarian just in the nick of time or with great advantage to his health; but this is certainly no reason why he should spend the remainder of his days in trying to persuade others that vegetarianism is good or necessary for them also. Again, a medical man may have a miserably weak digestive faculty, and need to avoid certain dishes which other folk can take, not only with impunity, but with benefit; but that is no reason why he should go about abusing and interdicting the things that disagree with him, while they agree perfectly well with the majority of mankind. By pushing dieting to the verge of starvation, we are simply pretending to cure, not curing; we impose on ourselves and on those who confide in our practice."

Deep Breathing.

In this season, when coughs and colds are "all the rage," any method of preventing them, and checking the first symptoms without drugs, may be of inestimable value. Therefore the following suggestions are offered:

When you find you have a cough, and before it gets to be deep-seated, go into the air and practice deep breathing. Draw air into the lungs until they are completely distended, raising the arms above the head during inspiration to more fully expand the chest. Hold the air in the lungs for a few seconds, then breathe it out slowly. Repeat the operation a dozen times or more, and after an hour try it again.

Persistence in this treatment will often cure a newly-contracted cough in a few hours. If the cough is of long standing, pain may be felt under the shoulder-blades and across the chest during the breathing, but as this is caused by the tearing away of adhesions of the lung tissue, it will usually pass away in a day or two, and the fact that it is felt shows that the lungs need thorough inflation.

Three cases have recently come under our observation where this treatment has proved beneficial.

The first was that of a lady who had been troubled with a dry cough for several months, but whose lungs were apparently sound. In three days she cured herself entirely by deep breathing, and, although a month has gone by since then, there has been no return of the cough.

The second was a gentleman who thought his lungs were failing. Deep breathing gave severe pain, as above described, but it soon passed away. A burning sensation was also felt in the lungs at each deep breath, owing to the access of oxygen to irritated lung tissue. The cough decreased in frequency and violence, he has gained in general health, and recovery will probably ensue.

The third was the editor of the *Journal of Health*. He "caught cold," which settled into a severe cough. A dozen inhalations would stop the cough for an hour or two, when it would return and be stopped again in the same way. Two days' treatment drove it away entirely.

Sometimes the first deep breath is interrupted by a cough, but after a trial or two the inclination to cough can be controlled, and after five or six breaths are taken a sense of relief is felt and the desire to cough passes away.

A physician friend informs us that he has seen many cases of supposed consumption speedily cured in this way. At all events, it can do no harm to try it, and benefit may result.—*Hall's Journal of Health.*

Mullein for a Cough.—According to some of our medical journals, the use of mullein as a palliative for the cough from the lungs, seems to be meeting with favor in various quarters. The customary form of administration has been a milk decoction of the plant. More recently the smoking of the leaves has been recommended as a more agreeable and effective method of administration.

Keenness of Sight.—At a recent meeting of the Society of Arts in London, a paper was read on the subject of aids to the eye-sight. Dwellers in towns, it was remarked, rarely looked at a distant object, and the townsman's eyesight is hopelessly inferior to that of the average Scotch forester.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

EXTRAORDINARY STRIKE IN THE MAMMOTH.—This famous mine at Middle Bar keeps up its reputation as the most remarkable property in the county for heavy deposits of free-gold-bearing ore. Never since the rich vein was first encountered two years ago has the gold-freighted seam been entirely lost sight of. It has varied in dimensions considerably—sometimes narrowing to very slim proportions and again widening out and forming a bunch of metal of flattering size. For some time past this vein, in connection with the main body of quartz has been followed in an upward direction from the tunnel level. Last week an immense body of that peculiar black metal common to that region was struck. The ore does not carry so heavy a percentage of gold as some of the earlier strikes, but there is vastly more of it. One blast threw out a ton and a half, and in the past week from 5 to 6 tons have been taken out. It is difficult to estimate the gold-yielding properties of such ore. Mr. Nevills, whose thorough acquaintance with this character of metal has made him an expert, estimates that it will yield in the neighborhood of $5000 per ton.

MISCELLANEOUS.—The St. Louis mine near Pine Grove, owned and worked by Sidney Smith and a Mr. Reed, has greatly improved of late. The ledge has increased in size, and shows free gold to the naked eye. The owners have made fair wages by working less than a ton a day by arastra process. They contemplate getting a small stamp mill at an early date. At the Amador Queen at Murphy's Ridge another pocket was struck during the week. These pockets have been of frequent occurrence, although no regular ledge has been met with so far. Mr. Shugert, we understand has made arrangements for the construction of a large mill in Hunt's gulch.

El Dorado.

HENRY'S DIGGINGS.—*Mountain Democrat*, March 6: J. H. Bradley's flume, carrying water to Henry's diggings broke down, but will be rebuilt by April 1st. Bradley & Co. are still at work getting fine prospects. Wm. Cole and Sexton are doing well. Gus Anderson made a cleanup that pays him $6 a day. Armstrong & Roberts have a large quantity of gravel on their dump, and are at work every day. Henry's diggings is bound to be a good mining camp, both in gravel and quartz, and there is some good farming land to be had, with plenty of wood and water.

ORE.—Placerville *Observer*, March 10: Peter Gross was up from his claim in Mud Springs township the middle of last week, and reports that he has "found it big," and will have a mill on it within 30 days. He showed us some very rich looking ore, and affirmed that he had any quantity of it in sight. Pete is a live prospector.

Inyo.

WHITE HILL MINE.—Inyo *Independent*, March 7: At the White Hill mine a new tunnel was started about 10 days ago, the ledge was struck within a few feet of the surface, and the tunnel has since been run in ore all the way. Already a good quantity is ready for shipment, and is of as good quality as that lately shipped from other parts of the same mine. The White Hill is developing into a good property.

SUPERINTENDENT'S REPORT.—Superintendent's office, Modoc Con. Mining Co., Lookout, Cal., March 1st, 1885. J. W. Pew, Sec. *Dear Sir*: I am still sinking winze from the 110-foot level (South Lookout) present depth 73 feet. Ledge in bottom strong with from one to two and one-half foot of 72-ounce ore. Will start level as soon as I am down 75 feet. It is only a question of getting in coal, iron and wood when I will start up the furnace again.

Signed, F. FITZGERALD. Lessee.

Nevada.

HORSESHOE MINE.—Grass Valley *Union*, March 6: A south drift is being run on the 100 level of the Horseshoe mine, which shows a small but good ledge, the rock showing well in free gold. It is the intention of the company, when the season is somewhat advanced to put in a larger water wheel to do the pumping and hoisting, and then sink the shaft for another level, the present wheel not being of sufficient size for that purpose.

PROSPECTING.—Grass Valley *Union*, March 8: Prospecting is quite lively in this district at the present time. It is probable that some good properties will be developed during the coming summer.

PRESCOTT HILL MINE.—The prospects of the Prescott Hill mine have greatly improved of late, and there is now in the tunnel a vein of good size and excellent quality. The tunnel, which has been in the course of construction for several years, has passed into the old Betsy ground, and is now beyond the shaft that was sunk in that mine many years ago. There are good backs above the level of the tunnel, and before these are worked out a winze will be put down and another level opened. The prospects of the Prospect Hill mine are now better than at any previous period.

MINING STRIKE AND TROUBLE.—*Tidings*, March 9: In the old Wheal Betsy mine, near Osburn Hill, a very rich ledge of quartz has lately been found. The ledge averages about 14 inches in thickness, and is of as fine a looking quartz as can well be seen anywhere. It is just what the company have been running for years, and we believe the tunnel is now in nearly three-fourths of a mile. We understand that there is some kind of a difficulty in progress today about the ownership of the mine, and that the law will be called upon to quiet matters.

NEW RIVER ROCK.—Grass Valley *Union*, March 6: Caswell C. Smith has just returned from the New River mining district, and brought with him some quartz from that section. The rock is rather hard and flinty, most of the gold being on the outside in a coating of red ochre. Some of the quartz will mill as high as $100 per ton. Smith reports the ledges in that far off district small, but numerous.

Placer.

MORNING STAR.—Placer *Argus*, March 6: The Morning Star quartz mine, of Ophir, is again to the front. As a result of 28 days' run with seven men, there has been cleaned up 538 ozs., 4 dwt. and 15 gr. of gold, valued at about $7,800. This is an average of about $50 per ton.

Shasta.

EXCITEMENT.—Redding *Independent*, March 6: The mining excitement still prevails to a considerable extent. A good many prospectors and mining men are making new quartz locations and sinking shafts in numerous places within a few a few miles of town. It seems probable that we are in the vicinity of a silver ledge of remarkable richness. Further developments will prove whether they be so or not, but in the meantime the mining boom is having a good effect on the business of our town.

SILVER AND GOLD.—Shasta *Democrat*, March 6: The Silver King silver vein has been definitely traced north to a point where it seems to cross the Sacramento river a short distance south of the mouth of Spring creek. N. J. Pehrson is sinking on a claim on Oregon gulch that is promising to be good property. He has a shaft down 15 ft and a solid body of ore is coming in. Mr. Dale of the Buckeye district last week brought some fine samples from his claim in that locality. The ore not only shows free gold, but also carries a good per cent of rich sulphurets. A party of San Francisco capitalists arrived here last Monday evening and to-day took a private conveyance for French gulch. They are looking for mining property to purchase. A couple of mines in the French Gulch district were bonded to San Francisco parties last week, and are told the bonders will be up in a few days to determine what they will do with the property. Mr. Thos. Derby of the New Almaden mine and Mr. Aug. J. Bowie the well-known mining engineers have arrived from San Francisco, on their way to French gulch to examine some mining properties in that district. A strong vein carrying silver is said to have been discovered one day last week just above the Tower House by a Montana prospector. The ore resembles that of the Silver King very much. The finder is elated with his prospect. Dan O'Neal is building a new arastra that will grind from a ton and a half to two tons a day. Lately we opened up a body of quartz that is richer than any he has taken out yet. Several of our townsmen have recently located mining property up the river near tunnel two. They became somewhat excited last week at the prospects their quartz produced and straightway sent two men up to sink on a couple of locations. Many strangers, mining men and prospectors mostly, continue to arrive daily by the train. Some few go on to Trinity county, but most of them come with the intention of first thoroughly satisfying themselves as regards the mineral wealth of Shasta county. Last week Jim Mead made a discovery on the Sugarloaf mountain only a short distance southeast from Silver King. The quartz is thoroughly mineralized and has all the indications of being good silver ore, the vein appearing to be a very large one. It is possible that Jim has struck a bonanza. He has made three locations. Silver is now causing most of the mining excitement, many prospectors having turned their attention to bunting for silver-bearing veins. We are told that a number of prospectors are finding good silver traces in the Buckeye district, and several are scouring the country between Pit river and Furnaceville district, and several are also in the limestone belt north of Redding. The shaft of the Silver King mine has now reached a depth of 50 ft. They will sink 10 ft more, when drifting on the vein and stoping out the ore will commence. The vein is now over 2½ ft wide and looking better than ever before. Recent assays were $300, $400 and $700 per ton. Several Colorado and Nevada prospectors who have been here for a month past, and who have been engaged for years working in and prospecting for silver ores, say they are confident that the Silver King lode is not the only lead of that metal that runs in northerly and southerly directions both east and west of the Sacramento river. They have had years of experience in silver ores and naturally can tell the formations in which silver carbonates, bromide, etc., exist. The discovery of the Silver King lead led them to prospect and study its country formation, and they have found like formations running through the country, both east and west of the Sacramento river, parallel with the Silver King, which has already been definitely traced to a point where the vein crosses the Sacramento river a short distance south of the mouth of Spring creek. One experienced and intelligent prospector says he is confident more rich leads are sure to be discovered in these belts notwithstanding the country is low and "float" seldom seen.

Sierra.

CLEANUP.—*Mountain Messenger*, March 6: Two hundred ounces were cleaned up by the Bald Mountain Company last week. The gravel at the foot of the incline under the lava flow is very hard, and requires blasting. The lead is narrow but very rich. Only three carloads of gravel is rolled out by one man on a shift of ten hours.

Siskiyou.

PICK AND PAN.—Yreka *Union*, March 6: McNeal & McLaughlin, on Salmon river, near Oliver's Flat, last week cleaned up 160 ounces of dust, which liberally compensates them for their work, and leaves a handsome profit besides. Their claim is only one of the many rich ones in that section, a district which bids fair to supply paying mines for the next century to come. The Schroeder boys, in the Deadwood district, are working their bonanza for all it is worth. Their several ledges continue to prospect immensely rich, and it will not take them long to accumulate a fortune. Their arastra is running full time.

ON THE KLAMATH.—Yreka *Journal*, March 6: We learn that R. H. Campbell will have at least two months more water for piping at his extensive hydraulic claim in Quartz Valley, and has been doing big work ever since New Year's. At Klamath river the river mining companies have commenced getting out timbers, and preparing to put in water wheels, expecting to get into their claims earlier than usual, as there is but little snow on the high mountains to keep the stream up as late as during most seasons, with no chance of heavy freshets. The prospects of successful river mining in the Klamath during the coming spring and summer never looked more promising than at present. W. McConnell intends commencing work in his mine on the Klamath next week, by putting in one wheel and one derrick to remove large piles of bowlders in the way. He also intends seeding a large extent of ground in alfalfa, and planting over a hundred more fruit trees in his orchard at the mine. The Chinese river mining companies at Oak Bar and vicinity on the Klamath, are commencing their preparations towards reopening their claims for spring and summer work.

Trinity.

WORKING AWAY.—Trinity *Journal*, March 6: From this side of the raging Trinity we observed that those best of paying mines—the Red Hill claims of Bartlett & Evans and Lorenz & Co., were running their hydraulics and apparently doing good work. It was also noticed that Lorenz & Co. have their hydraulic elevator at work on Parks Bar on this side of the river. Mr. McKenzie returned to Redding last Sunday from a short visit to the East Fork district in Trinity. He brought with him an average of ore from Enterprise and Lone Jack mines, which show up handsomely. He informs us that Day & Moore had just finished making a cleanup of a little over $2,000 from 20 tons of their rock. He further says the mining outlook is very flattering in that district. For some cause miners, generally, are partial to the East Fork country, which is destined to become one of the richest mining districts in the State.

FROM THE NEW GOLD FIELDS.—Red Bluff *Democrat*, March 6: From a private letter received from Geo. de la Flechell, formerly a resident of Red Bluff, but now engaged in prospecting on the East Fork of the North Fork of Trinity river, we learn that new mines are being found in that section, although the weather has been unfavorable. The veins are mostly small, though generally rich, and lay along the edge of the creek. The rock is easily worked and by process of arastra pays richly. The country is rough and prospectors have to rough it. East Fork is about 30 miles northwest from Weaverville, and somewhere near about the same distance from the New River country. The country intervening between the two camps will, he thinks, be overrun with prospectors as soon as spring opens in earnest, and some good ledges will probably be uncovered. The quartz found in this section is similar to that of the famous Black Bear mine in Scott valley, and as that ledge must cross the Salmon on a line even with some of the locations made on New River, it is a reasonable presumption that the finds in that section are a continuation of the Black Bear strata. It may be possible that the discoveries in the East Fork section bear some relation to this immense strata lying to the west, as the ore is nearly identical, but from developments as yet made it would be difficult to say. The mines at East Fork and New River are not "bladder" schemes, by any means, as there is no question of the existence of rich deposits and an extensive field for research.

NEW RIVER MINES.—Cor. Trinity *Journal*, March 9: I see by the papers that some persons have been sugar-coating the New River mines too thick, and that the pill is hard to swallow. We have a few rich mines, but, as a rule, the ledges are small. I will give you a brief sketch of them, without exaggerating. Before doing so, I think it proper to caution persons who think of coming here in the spring looking for work, that they better stay away; they will be a year too soon. On the other hand, those who are on the prospect cannot find a better place. I have always said that the middle and southern mines of California are ten years ahead of the northern mines, and am certain that if one-half the money and labor which has been expended in any county of Nevada, Arizona, New Mexico or Utah had been laid out in Trinity, Shasta and Siskiyou, the parties so doing would have had 100 per cent better returns. Our natural resources are infinitely better; plenty of wood and water, and the counties mentioned not half prospected. Time will prove my statement correct. Pony Creek, on the southern boundary of the New River district, has not been much prospected for quartz. The placer mines were the richest of any creek in the vicinity. Crossing over a divide to Slide Creek, the first mine belongs to a San Francisco company, represented by H. Lang, who is running a tunnel. The prospects are good. Next is the Mountain Boomer, one of the first locations made in the district. The ledge is small, rather broken, yet tolerably well defined. I am positive the rock crushed paid over $100 per ton. Thomas Knight & Co. have some good locations; not much work done. Tough-nut has the same character of quartz as the Mountain Booner, the ledge is situated about the same and will pay as well. There is a cluster of mines around New River City. Of the Nevada, the surface and rock on dump prospects well, the rain filled the shaft; one of the owners says it averages a foot in width. Huntington and Big Chief join; ledge 14 inches; between walls, three feet, prospects well. These three mines have every indication of being a good property. About one mile west is the Mary A., which has all the requisite qualities for a good mine. On the divide between Slide Creek and Battle Creek are the Hard Tack and Ridgeway. So far as developed they are the best two mines in the district. More work has been done on them than on any others; perhaps this is the reason they show so much better. They join, and both have shafts 80 feet down. The Hard Tack arastra is running, and a good clean-up is confidently expected. The Ridgeway has bought a mill, which will be packed in as soon as possible. Liae Oak, Live Oak Extension, Friendship, Celeena, and a host of others I don't know much about. The Friendship is a very large and well-defined ledge, though of low grade. I think it a good prospect, as most of the claims had to sink twelve or fourteen feet to get $30 rock. Very little work has been done toward developing it. Golden Gate, Occident, Orient, Argonaut and Good Enough are the principal mines on Battle Creek, and I think they are good ones. The Golden Gate is bonded for $11,000; the other four are just as good. I am of the opinion that there are only two ledges that will average $100. I suppose there is no need to say anything about the Mary Blane and Yankee Boy; as soon as weather permits their mills will be running. The Grover Cleveland is a daisy; thirty-inch ledge, well-defined; good wall. I think it will average $40 a ton.

NEW RIVER FINDS.—Yreka *Journal*, March 6: The New River mines continue to attract considerable attention, and will soon be visited by an army of prospectors. A number of very rich paying ledges have been discovered, and the great prospecting field for new ledges at that region will be in the southern part of this county. A trail is to be opened between Cecilville in the Salmon river section of this county, to New River, on which only seven or eight miles will require any work to be done, and when completed will be the shortest route to the new mines either by way of Trinity Center or from this place. A good trail leads to Cecilville from Trinity Center on the Scott valley and Redding wagon road, over which a weekly mail is now carried, and in this county a good trail is built from Etna to Yocumville and Cecilville, with trails to New River which come together before crossing the divide to New River. Chas. Baird, who is engaged extensively in the packing business, has just returned from New River by the route from Cecilville, and intends making a full load of provisions to the new mines next month, there being very little snow on the route to interfere with making good time. In addition to the labor and money advanced to fix up the trail from Cecilville, the New River miners will give a couple of hundred dollars for the same purpose, knowing it is the shortest route to secure the cheapest flour, grain, hay and farm products, as well as beef and bacon.

NEVADA.

Washoe District.

HALE AND NORCOSS.—*Enterprise*, March 7: Work is being pushed at the above mine, and the managers intend to find an ore body if there is one to be found. They have advanced No. 1 crosscut, on the 2800 level, and are now in over 50 ft in good-looking quartz. The No. 2 crosscut is also in fine quartz. On the 2900 level the north drift is in about 110 ft. No. 2 crosscut on this level is in about 55 ft and is in quartz and porphyry, having passed through about 10 ft of good ore, some of it being very rich. They expect soon to encounter the same body of ore found in No. 1 crosscut on the 2800 level, but are not in far enough yet to be under it. On the 3000 they are driving a north lateral, just skimming the ledge, and are in a fine, heavy clay formation. They will crosscut after advancing further.

OPHIR.—On the 500 level have been engaged in cutting a drain and timbering. The drift which is being run north from the west drift on this level is a joint Mexican and Union Consolidated drift.

OVERMAN.—Two shifts have been put to work in the Overman mine. The old Lambert tunnel has been cleaned out and will be driven in to strike the croppings on a level with the railroad side track.

CROWN POINT AND BELCHER.—At the Belcher and Crown Point the usual amount of low-grade ore is being extracted from the old upper levels and sent to the Carson river mills.

C. AND C. SHAFT.—Ore is being extracted from the 1200 level under the Jones contract and is shipped to the Eureka mill.

SAVAGE.—Nothing of importance is being done in the Savage, but they are waiting for the result in Norcross.

GOULD AND CURRY.—The usual work is being done, but nothing of importance has occurred during the week.

CHOLLAR.—They are running a drift in west on the 2800 level and are in good looking ground.

SIERRA NEVADA.—Work of repairing machinery, etc., is progressing favorably.

BEST AND BELCHER.—They are pushing forward the north drift on the 1000 level.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, March 6: The west drift on the sixth level has advanced 10 feet during the week, and is now in 156 feet. The south cross-cut from this level is in 45 feet. The west drift on the fifth level has been driven 12 feet, and the face shows a little low-grade ore. The stope from this drift is turning out some $60 ore from a promising ledge. The west drift from the raise above this stope is in six feet and shows 18 inches of $100 ore. The intermediate, between the fourth and fifth levels near winze No. 2, is giving some $30 ore from an encouraging looking ledge. The stope between the third and fourth levels and near winze No. 3, is giving some $100 ore from a ledge now showing about a foot in width. The stope between the second and third levels and west of the shaft, is looking well and turning out the usual amount of ore. The mine, as a whole, is looking well and turning out nearly as much ore as is being crushed. A bullion shipment amounting to $10,847.73 was made on March 1st.

Eureka District.

WHAT IS BEING DONE.—Eureka *Sentinel*, March 7: While times are unprecedentedly dull with us, and while work has, to a great extent, been suspended by some of the larger companies operating here, yet the prospects in the mines close to Eureka were never more numerous, and if we believe one-half of what we are told, they were never better than at present. The Richmond mine, which has produced several millions in bullion, is closed down and no work is being done in the property at present. In the Eureka Con. some 40 men are employed, and, according to strict rumors, a body of ore has recently been encountered on the 700-foot level, which is said to be exciting a great deal of interest on the part of interested parties. The strike is reported to have been made by a tributer named Williams on Thursday last. The Lord Byron mine yields its usual quantity of good ore, and during the past week shipped to the Richmond furnaces 57½ tons. Some tributers in the Bowman shipped recently to the same furnaces for reduction 20½ tons of ore. The King Lear sent in on Thursday last three and a half tons of rich rock to the Eureka Con. furnace. On Wednesday two and a half tons were shipped to the same reduction works from the Hillside. The Phœnix, on Ruby Hill, which property is owned by a San Francisco company, shipped 13 tons of good ore to the Richmond works during the early part of the week. The Rescue also made a shipment of seven and a half tons. Owing to the melting of the snow on the mountains, the roads in places are so heavy that it is considered impracticable to haul ore from several properties that are yielding well. Altogether the mines immediately about Eureka are looking well, but owing to the fact that but few miners are working for wages, there is comparatively little coin in active circulation, and consequently a stringency is experienced by business men and others of Eureka.

THE EUREKA CON. MINE.—*Sentinel*, March 9: A reporter yesterday spoke to Supt. Robbins, of the Eureka Con. mine, concerning the rumors on the street of new and valuable developments having been made in that property recently. Mr. Robbins stated that the mine generally is looking better than it has at any time during the past year. The ore deposits on the second and third levels are yielding well, and

on the seventh and twelfth levels the deposits are unusually promising and flattering. The extent of them has not been ascertained, nor can an approximate idea of their size be learned for several days yet, and probably longer. One feature of which pleases Supt. Robbins especially, is that they are both in sections of the mine that have not been prospected much. Miners on the streets, who claim to know whereof they speak, say that the seventh level development, or the Williams' pitch, is liable to prove a bonanza of no mean proportions. The reporter noticed a cheerful air pervading the company's office, which was not inspired altogether by the bracing weather.

Silver Glance District.

GOOD REPORTS.—Virginia *Enterprise*, March 6: Good reports continue to come from the mines near Mountain House and Wellington. Willard & McDonald are running their little mill on good paying ore, and an exceedingly rich gold ledge was discovered last week in the mountains seven miles north of Wellington, near the old Carson and Aurora stage road.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, March 6: Drift north, on the 150-foot level, has been advanced eight feet; total length by contract, 78 feet. No material change to note.

INDEPENDENCE.—South drift, 400 foot level, has been extended 1,077 feet; progress for the week, 13 feet. Cross-cut east, same level, has been advanced four feet; total, 53 feet. Rock continues very hard.

BELLE ISLE.—North drift, from east cross-cut 400-foot level, has been advanced eight feet. The ground is considerably broken. We are preparing to stope some ground, above the 250-foot level, on the west vein.

NAVAJO.—Have started a cross-cut near the shaft on the 150-foot level, to prospect a vein encountered several years ago above this level in sinking the main shaft. Johnson's cross-cut east on this level has been advanced 14 feet. No. 3 cross-cut has been extended six feet; total length, 142 feet. Work has been resumed in the face of No. 2 cross-cut. Drift south, from No 3 cross-cut has been driven eight feet the past week—total length, 19 feet—and continues to yield some good ore. No. 2 upraise on the east vein is up 83 feet, ledge fair size. ore low-grade. No. 1 winze on the east lateral vein, 350-foot level, has been sunk 68 feet; progress 20 feet. On the 650-foot level during the past week, we have driven with the power drill 40 feet, the south drift having been advanced 16 feet, and the cross-cut east 14 feet. No material change to note.

White Pine District.

ENCOURAGING.—White Pine *News*, Feb. 28: The reports that reach us from Hamilton are of an encouraging nature as regards the mining outlook next spring. The Sweetwater Company's, and the Edgar and Ward Beecher mines are showing some promising developments.

Willow Creek District.

PRODUCING WELL.—Eureka *Sentinel*, March 6: John McGrath, assayer and superintendent of several valuable mining properties at Willow creek, is in town. From him we learn that the Wild Deer mine, owned by H. H. McColley, is looking exceedingly well. The shaft has been sunk to a depth of 165 feet, and a true fissure vein, encased in slate, and six feet wide, has recently been discovered, a two-foot streak of which near the foot-wall will average $100 a ton. Mr. Grath stated that since his arrival in town he has received intelligence of a new strike in a tunnel on the property, which is run in on the vein about 750 feet down the mountain from the shaft, of a four-foot vein of good paying ore. He says the Ohio mine which was recently purchased by a Salt Lake company, is also looking well. They are gradually increasing their force of men, and they talk of putting up concentration works at an early date. The vein of ore in their property is similar to that in the Wild Deer, but it is of a more refractory character. Mr. McGrath says that the average assay of the ore thus far extracted in his section to be worked has been over $100 a ton. It is the intention of his company to start up within a fortnight their five-stamp wet crushing mill. His principal mission to our town is to make certain tests and to ascertain the proper processes for the successful working of their ore. They have enough ore on their dumps and in sight to run the mill at its present capacity for six months. About 20 per cent of the ore of the district is gold. Along Willow creek several gold quartz claims are being worked, and they yield well. Some assays of the ore go as high as $2,000 a ton. Altogether the entire district is looking well, and recently quite a number of letters have been received by him and others there from outsiders asking for information concerning the camp. He believes the section a good one for miners and prospectors. Willow creek is on the Silver City stage road, 35 miles north of Winnemucca.

ARIZONA.

HEAD CENTER.—Tombstone *Epitaph*, March 1: Yesterday, in conversation with a late employe of the Head Center mine, it was learned that the mine would resume operations in the course of two or three weeks. It was also ascertained that the mine had closed down on account of some difficulty between the Head Center and Tranquility mining companies, regarding a stock apportionment. It will be remembered that the above companies were some time ago consolidated, after a prolonged and exciting law-suit in which thousands of dollars were spent by both sides. A compromise was effected by consolidation after a verdict had been rendered, and at this late day a dispute has arisen as to the proper apportionment of stock. When the Contention consolidated with the Flora Morrison the latter mine gave over all of its stock to the former, and received but a very few shares of the Contention. It is not known how the case stands with the Head Center and Tranquility, but it is hoped the squabble will be peaceably settled and operations resumed. Sixty or seventy men thrown out of employment at this stage of the game makes a decidedly perceptible difference all around.

CHERRY CREEK.—Prescott *Courier*, March 6: The Conger mine, Cherry Creek district, is opened by shaft a depth of 100 ft, a tunnel 283 ft and another tunnel 187 ft. It has a very long chimney of ore. The Cactus mine, in same district, is pierced by a 200 ft tunnel; there is also an 85 ft winze. Both these mines belong to capitalists who reside in Stark county, Ohio. Ore worth $4 a pound has been taken out of them. The ore is richest in gold. A 10-stamp mill, which is run by water power, operates the mill and its two concentrators. Mr. C. A. Bush is the superintendent, Mr. James Tappan foreman of the mines. Mines, mill, etc., are managed in a business way; there is no hurrah, no leaks, no idleness, The work of putting a very large dam in the Verde river and cutting a ditch necessarily costs considerable money, but both improvements are there to stay. A smaller wheel, more concentrates, rock breaker and other things will shortly be added, and we risk nothing in stating that the property is sure to pay. Mr. George H. Hammond, a most excellent miner, visited the Sterling mine a day or two ago. His opinion is that it is a good mine. Several carloads of ore will soon be shipped from silver mines on Cataract creek.

PUMPS.—*Record*, March 6: The Grand Central mine, at Tombstone, now employs 200 men. The new pump is said to be the largest ever put into a mine on the coast at the same depth and only exceeded in size by the Union pump on the Comstock.

SILVER ORES.—Nogales *Frontier*, March 6: A large amount of silver ores is shipped from Nogales to Benson and Pueblo smelters. A smelter would pay a handsome return on the investment if established here.

MINING IN MOHAVE.—*Miner*, March 6: In the Twin gulch near Cerbat, Mr. Jones has an arastra running on ore from the Eureka and Vanderbilt mines. We hope he will make a success of it. On the Tigress mine at Stockton Hill, Messrs. R. Gray, Reilly & Mechan have been at work for some time, getting out a carload of ore for shipment. The work was completed yesterday, and the first load has already left for Kingman. This is one of the oldest claims on the hill, and has produced a large amount of very rich ore in years past. We are pleased to note that preparations are now being made to open up this mine in a systematic manner, by running a tunnel under the old workings. A road will also be built from the dump to intersect the Kingman road, and thus avoid the expense of packing. John Kennedy has two men at work on the Little Chief, one of the best known high grade mines in Wallapai district. He has about 5 tons of ore on the dump, about 2 tons of which be calls first-class ore, and which may be depended on to mill in the neighborhood of $700 to the ton, while the other three will reach $300 to the ton. The Little Chief has already produced about $50,000, and seems to be keeping up its reputation as a bullion producer. At the I. X. L. mine, the Burke Bros. are taking out a fine grade of ore and lots of it. We are told that recent work has exposed to view a splendid body of ore in this claim. We hope so, for the boys are good workers and deserve to strike it rich. On the Star Spangled Banner, at Stockton, Hon. David Southwick has three men at work, taking out a fine grade of galena ore. Wm. Engle, one of the pioneers of Wallapai and Cedar districts, is putting in his time on the Bullion mine. Frank Sage and Joe Bolan are working on the Moonbeam mine, at Stockton Hill, and taking out $400 ore. It is estimated by experienced miners that there is from $15,000 to $20,000 worth of ore in sight in this mine. The force of men will probably be largely increased as soon as Mr. Gale, the fortunate owner, returns from New Orleans. Isaac Conkey is taking out a fine grade of galena ore at the "Old Standby," on the divide between Stockton and Cerbat. The last carload shipped from this claim assayed 33 ounces in silver and 58 per cent lead. Wynn Sherman has just finished packing 12 tons of ore from the Golconda mine to Cerbat, and Musser's teams are employed in carrying it to Kingman. Mr. Sherman informs us that the bulk of this ore will assay 50 ounces in silver and 60 per cent lead, while some of it will go much higher in silver. Kimble Bros., of Signal, have four men at work on the Signal mine on the McCracken lode, who are taking out considerable ore. The Burro Mining Comoany shut down their mill a few days ago, but still have quite a force of men at work on the mine, which is undoubtedly a valuable piece of property. Mr. James Music a thorough practical miner, is superintending the mining operations of this company. Messrs. Asbury and Lockhart are working the Mocking Bird mine on a lease. The mine was in bad shape when they took hold of it a few weeks since, and considerable dead work had to be done before the work of taking out ore could commence. We are pleased to state that they have struck good paying ore during the last week, a sample of which assayed 110 ounces silver.

SNOW.—Prescott *Courier*: There is an undeniable dearth of mining news in this section at present, though the prospect of more lively times in the near future is quite encouraging. The snow in the Hassayampa and Bradshaw mountains is a serious obstacle in the districts south of Prescott. Last week, while it tained hear it showed in the mountains. Fred Sattes, who came in from Crook canyon, says 10 inches fell on the Maple gulch divide, and the Prescott and Bradshaw road is not passable for wagons beyond the Hassayampa bridge, and will not be for several weeks to come, as it is certain to snow more in March. Wagons can get in to Turkey creek, Pine flat and the Peck districts by going the old road by Big Bug, east of the range, but the road is sadly out of repair. Out in that section, John Holmes, Mulvenon & Roach, the Pine Spring Co., and others in the Peck and Tiger districts, are taking out good shipping ores, but will not attempt to move any of it till the roads are in good condition. West of Prescott, on the A. B. mine, the leasers are in 225 ft with the tunnel, and last week have had a streak of black sulphide and native silver ore, from 2 to 4 inches thick, assaying over 400 ounces per ton.

GOLD ORE.—Messrs. Olden & Nicols, from Upper Verde, report that the Conger mill has been treating the gold ores of that section with good success, which will stir up business in Cherry Creek and Black Hills districts, as the mill proposes to work custom ores at reasonable rates. Mr. Olden is preparing to send 100 tons of gold ore to the mill, and also to ship a quantity of silver ore to Pueblo, Colo. Governor Tritle has two experts examining the various mining claims on Big Bug, Lynx creek, Hassayampa and other sections which might be tributary to the Howell works, in Walker district with a view to starting up the works in the spring. The placer miners in all directions are getting out gold from the old diggings which have been worked each spring for the last 20 years, and occasionally we hear of a little strike of something like old times, but the average pay is small. Want of water to work the high bars is the trouble with placer miners. Several parties have recently been making inquiries for gold-bearing quartz veins, and a large property of that description could doubtless be sold at good figures. The recent slight advances in the prices of galena and copper has produced a better feeling among the owners of such properties, who hope to be able to resume operations in the spring.

COLORADO.

NOTES.—Georgetown *Courier*, March 5: Hood & Co. have a large body of low-grade ore in the upper workings of the Griffith. The Centennial's output last week was nearly 17 tons. The ore is increasing in value. The lessees on the Niwot lode, Leavenworth mountain, are reported to be taking out some good ore. A prominent Democrat mountain mine will soon be started up with a large force of men on day's pay. The Terrible mill will be repaired and the machinery put in condition for a resumption of work by the 15th. The two ore houses at the Colorado Central mine are full of ore, and sacked ore is found stored away in scores of places, throughout the mine. Seven men are employed at sorting. The miners on the Owasco and Atlantic lodes, on Brown mountain have been experiencing much trouble with the snow, which lies to the depth of nearly 4 ft. The lessees on the former have found it impossible to ship any ore since December. The Atlantic boys managed to bring some ore down last week by sliding it over the frozen surface of the snow in gunny sacks. The Swamp Angel is in good running order again, the shaft and levels having been cleaned out. Messrs. Rockwell & Co. deserve considerable praise for the perseverance they have shown. During the last five months they have been constantly expending money and have put in a new pump and accomplished other improvements.

THE BALTIMORE.—This property never looked better. Ore is shown in all the workings. It has been paying during a number of months past a dividend of about $2,500 per month, besides during a large amount of development. Mr. John Fillius, the superintendent, hopes to increase this dividend to over $4,000 per month or about $50,000 during 1885. The mine is being systematically developed and new ground is being opened up. As fast as ore is worked out in one portion new bodies of ore are opened and ready to take out in other portions. The average value of the ore is over $300 to the ton.

THE COLORADO CENTRAL MINE.—A trip through the labyrinth of levels, shafts, cross-cuts and tunnels of the Colorado Central mine, readily convinces one that it is one of the most stupendous enterprises in the State. There are nearly 6 miles of these openings on the property, which cost an immense sum of money, but the wealth it has produced will run up into the millions. Through nearly all these openings can be traced veins of ore, sometimes pinched to a knife blade seam, and then opening into a 2-ft vein. The work for a number of years past has been confined to development, and now there are over 25,000 fathoms of ground opened, ready for stoping, in every fathom of which there is big pay, and which would take the present force two years to work out. Besides, there are thousands of fathoms ready for stoping, in which there is every probability of finding large and rich ore bodies. Nearly all the ore exposed in the workings is of a high grade, much of it, when closely sorted, mill over a thousand dollars to the ton. It is surprising to the uninitiated to learn that the small veins of ore net a neat profit for all the rock that has to be taken out while drifting. But the grandest sight in the mine is to see veins of ore, from 12 to 18 inches thick, of nearly solid mineral, through which is interspersed ruby silver ore, polybasite, and gray copper. Such bodies represent immense wealth. It is the intention of Mr. Hall, the superintendent, to keep up the present system of development, and increase the force workmen according to the means of handling the ore and debris economically. In this connection we might mention that the system inaugurated by Mr. Hall for handling rock is not surpassed in any of the mines. Everything is arranged to avoid, as far as possible, the slow and laborious process of using a shovel.

IDAHO.

SALMON NOTES.—Cor. Idaho *Messenger*, March 3: John Gilmer of the Kentuck mine of Mineral Hill, passed through on his way to Salt Lake. He took down the first cleanup from the new mill. Something over 40 pounds of gold for a short month's run—a decidedly paying investment for the Kentuck company. Harrison & Rolston recently opened a fine body on their new location. Our friend, Mark Ainslie, has exceeded his fondest hopes this winter in Pine creek. Another mill will soon awaken its echo in that place. Among other discoveries, there has been found a fine vein of coal, close to Salmon, of the best character—bituminous. We will soon have coal to ship out instead of in. From all indications and the results of tests made, we will not want for material for a boom next summer. There is, a short distance from here—in quantity—a metal that has long been sought after but not found because our prospectors did not know its appearance. As black sulphurets in the early days of the Comstock, was cursed and cast aside as worthless because it interfered with the quicksilver in gathering the gold they were after and its value not known; so the miners of Lemhi have cursed the metal that has the same apparent specific gravity of gold and which has annoyed them. It is, beyond a doubt, tin. Tin ore in granite, in slate, in porphyry, in synite, and in greenstone. It is in the same formation, same country rock, as they recently found it in the Black Hills, and with tin—in quantity—added to our precious metals none can gainsay the assertion, that we live in one of the richest mineral regions of the world.

CŒUR D'ALENE.—*Sun*, March 6: Six hydraulics will be turned loose in less than two weeks on East Eagle. Prichard creek was booming yesterday, and the water was as clear as crystal. New mining locations are made in every direction, and when the snow disappears there will be a lively conflict of titles. Work was commenced yesterday on the Nugget fraction, at the mouth of Dream gulch, the next claim below the celebrated Webfoot. A miner from the head of East Eork of Eagle creek brought to the bank of Murray on Saturday, the washings of a single pan of dirt, which, on being weighed, reached the value of $3.60. His statement was that it came from a prospect hole on a tributary to Eagle creek. The sight of 14 ounces of dust in one pile so early in the season is a good eye-opener, and illustrates what Prichard creek is capable of doing the coming summer. The gold was brought to the bank of Murray on Sunday morning by the Frank Grove Company and came from the Frank Grove claim, a mile west of Murray. It was not sluiced out in the regular way, but was the result of prospecting with a pan during several days of the week. The Webfoot claim on Dream gulch made its first cleanup for the present season on Sunday, and the returns show a a little over two ounces of very fine gold. This result was obtained from the tailings of last year's washings, which were run through the sluices to get them out of the way of the drain ditch being run for active operations with hydraulics next month, if the weather does not interfere. The cleanup shows that there is a mass of fine gold in Dream which passed through the sluices last season, but will be provided for during the present one.

NEW MEXICO.

BONDED.—Silver City *Enterprise*, March 6: The Silver King mine, at Bald Mountain, recently bonded by Lewis, Colquhoun and Rich is looking remarkably well, we are informed by Lewis who came in this week. Work is progressing steadily upon it. The following ore shipments were made from Whitewater since February 15: McGregor Bros., Georgetown, three carloads of concentrates to Socorro smelter; Benson smelter company, nine cars of iron from their iron mine at Santa Rita to smelter at Benson; Smith, Tower & Co., Georgetown, one car of high-grade ore to Socorro. Nick Rascom, one of the most tenacious and progressive of prospectors, has been developing a group of claims at the head of Gold gulch in the Burros since the first of January, and reports having struck mineral that looks well, but which as yet he has not assayed. Mr. Rascom has bonded his claim at Malone to some Cal. people whom Murat Masterson of Deming represents. The Rose mine over which there has been so much dispute has finally passed into the hands of parties who will speedily commence development. The Silver Bar No. 1, the property of the Peacock mining company is showing some immensely large and rich bodies of ore under the present efficient management. Machinery will also be erected in the near future to treat the ores of this promising property. The Silver Bar No. 2, of which Joe E. Sheridan is superintendent, has suspended development work until officers and directors arrive from St. Louis. The property shows some fine mineral, probably enough to justify the St. Louis parties that own it in erecting a mill to treat its product. Silver Bar No. 3, the property of H. J. Hutchinson of Central City, gives promise of rivaling the above mentioned mines, as during the progess of assessment work a large body of high-grade ore was encountered that for extent or richness is not surpassed by any claim in the district.

MOGOLLON DISTRICT.—Capt. M. Cooney of the Mogollons, principal owner of the famous Cooney mine, 80 miles from here, visited Silver City during the week and reports everything pertaining to mining at Cooney as assuming a bright and prosperous outlook. Mr. Cooney has demonstrated since assuming personal management of his property that the marvelously rich and large veins of ore of his section when practically and economically worked even at the great disadvantages under which the mine owners have to contend can be made to pay handsomely. The property had run behind many thousand dollars under former management, but now we are pleased to state is paying its owners handsome dividends besides keeping up extensive exploiting expenses. Between three and four carloads of high-grade ore and concentrates are monthly shipped from this property; work has for the present been discontinued on the 750-foot level, pending the completion of an upraise of 70 feet which has been contracted for. This level is now 640 feet in length, and the last 70 feet has been run along on ore body which at several different points shows an average width of seven feet. Tests show this ore runs one and one-fourth ounces in gold and 20 ounces in silver. This vein is supposed to be the lower end of an immense ore shoot that crops out on the surface to a hight of 35 feet, and is 255 feet in length by about 24 feet wide. As soon as this upraise is completed the level will be continued 100 feet further under the mountain to ascertain the character and value of the ore, which shows from the above test at the present point to be of a very satisfactory richness. In the mean time another shaft is being sunk 50 feet north that will at a depth of 50 feet be drifted upon to determine the quality of ore at this particular point. When these developments are completed we are assured by Capt. Cooney that a complete reduction plant of a large capacity will be erected and the little mill in operation removed from its present location three milles farther up the gulch upon the mine. Pending the present extensive developments the mill draws its supply of ore from a large stope contiguous to the old main shaft. The mine throughout is looking well and many tons of ore await the erection of works of sufficient capacity to treat it.

OREGON.

WATER NEEDED.—Jacksonville *Times*, March 6: Water is running down fast and more rain is needed at once. Nail & Casteel, of Josephine county, have been on Applegate looking at some mines, and may conclude to work them. Frank Ennis, superintendent of the Sterling mines, informs us that his supply of water is getting light, which is generally the case. R. Cook, who returned from Steamboat this week, informs us that his tunnel is now 342 feet long and 180 feet deeper than where quartz was struck before. A company of our French citizens, known as Joe, Jerry and Jerome, who are mining on Kanaka flat, recently picked up two pieces of gold, which are worth $25 and $8 respectively. M. F. Hull, of Foots creek, who is in town, informs us that the miners of that section have done well so far this season. He says that Huston & Anderson picked up a piece of gold worth $18 not long since. Considerable mining is being done in the Steamboat district, with favorable results. Prickett & Finney recently picked up a nugget weighing nearly $30. Meldrum & Co. and Sargeat Bros. are mining on Brush creek and are doing well. G. B. Caldwell & Son have their hydraulic pipe at work, and are washing off a large amount of dirt, while Duncan & Caldwell are also busily at work.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

18 California Street, San Francisco, Cal.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Oreek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

"NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO, CAL.

GOLD QUARTZ and PLACER MINERS.

Silver Plated

AMALGAMATING PLATES,

For Saving Gold

First Premium Awarded at Mechanics' Fair, 1884.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought or gold separated for low percentage of result.

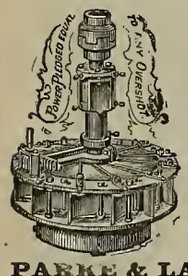
JAS. LEFFEL'S TURBINE WATER WHEEL,

The "Old Reliable,"

With Important Improvements, making it the



MOST PERFECT TURBINE NOW IN USE,

Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

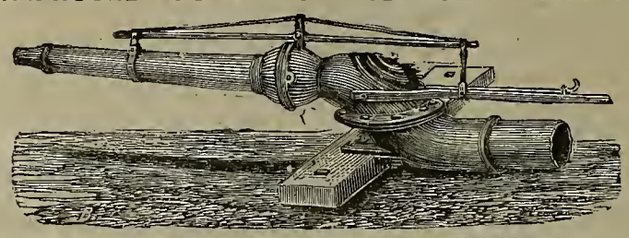
JAMES LEFFEL & CO.,

Springfield, Ohio, and 110 Liberty Street, New York City

PARKE & LACY, General Agents, **21 & 23 Fremont St., S. F.**

DEWEY & CO. { 252 MARKET ST., S. F. / Elevator, 12 Front St. } PATENT AGENTS.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All other styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

☞ PRICES furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

THE CUT REPRESENTS OUR

IMPROVED

HYDRAULIC

MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. ☞ Send for Circulars and Price List. **HOSKIN & CO., Marysville, Cal.**

CHILLED CAR WHEELS.

Medal Awarded, Mechanics' Fair, 1882

STEIGER & KERR, Occidental Foundry,

Calico District.

(Continued from page 173.)

Considerable development has been made. Owing to the high location and the abrupt raising of the walls of the canyon on the side of which the mine lies, the getting of ores to the wagon road is slow and difficult as well as very expensive. Tramways nearly 300 feet long, about 100 feet of which is nearly perpendicular, are used, and "Go-Devils" carry ores in sacks down the giddy hights to waiting teams in the canyon below. No machinery but a hand windlass is used. The scarcity of wood and water makes the use of the labor-saving steam engine, a costly and uncertain piece of property. The development on the Sue is not as extensive as that of the Silver King. But little depth has been made, although considerable good pay ore has been taken out. The formations are very much like those of the Calico mines. There is about five hundred feet of development on the Sue.

North End Mines.

Directly north of the Sue, on the south slope of a mound like mountain, is the Martha, owned by Dr. Julius Koebig, of Daggett. The doctor, it is said, is about to erect reduction works at Daggett. The Martha is not developed much as yet. The Lone Star group, owned by Messrs. A. G. Rhodes, Thomas Tait and H. E. Evans of Calico, is an excellent property, and although no great amount of development is done as yet, rich vein matter and high grade ores have been taken out. Eight men are at work on this Lone Star group. The ore is hauled to Waterman's mill, some fourteen miles distance. North of these mines but little development has been made on any claims.

East Calico.

The Garfield, Raymond group, the Snow Bird and a host of other mines, constitute the south end of the district. The formations are similar to the balance of the district, only not so rugged or numerous. The rich paying matter is sorted and sacked for shipment, and in the Snow Bird mill averages $75 per ton. These ores are found from grass roots down, and are virtually quarried out of the side-hills. A large number of chloriders are at work in East Calico. South of these mines the entire hills are taken up for horax claims, many of which are already yielding a large output. Barber's custom stamp-mill about one and a half miles distance, is putting in five new stamps, and when ready to start, will add much to the district's output.

Other Districts.

The Lava Bed southwest of Daggett is at present almost deserted. Work will be resumed early in the fall. Waterman, fourteen miles west of Calico, is working a good force of men, taking out ore, and in addition to treating his own, crushes for others. The Daggett mines and mill, southeast of Calico, is also adding to the country's ore and bullion output.

The Silver King Mill.

One mile north of Daggett station, on the bank of the Mojave, is the Oro Grande mill, now owned by the Silver King mine. G. Bahten has charge of the mill. The building is about 150x80. The process is the Boss continuous. Fifteen stamps, two grinding, six amalgamating, and four settling tubs constitute the process. After being fed into the rock breaker, the ore travels the rest of the way to the slickens dump by a series of self-feeding arrangements that work with a certainty and regularity that is admirable. Steam power oil is used for fuel, 13 barrels per day being required. About 75 tons of salt per month is used. The monthly shipments of bullion run from $40,000 to $50,000. Over $1,000,000 has been shipped by this mill since the King people bought the mill.

The Town of Calico.

Seven miles north of Daggett is the much-talked of city of Calico. One narrow and serpentine street is the only thoroughfare. The place is built ou a narrow ridge; the back end of lots on each side of the street end on or over a bluff. Small, hastily-built houses are the order of buildings, only a few two-story houses gracing the camp. Saloons are more than numerous. Business generally is overdone, and the number of black-legs and tin-horn gamblers that infest the place is remarked by the newcomer. The only water supply is that hauled two miles from Evaus' well, and costs from 3 to 5 cents per gallou. Wood is $10 per cord. Board, $7 and $8 a week. The Occidental and Whittield House are the only hotels, and they are pushed to their utmost capacity to accommodate the travel that is arriving daily. The camp is a good one, but at present is overestimated and overcrowded by men out of money and work. Capital, development and a chance is all that this camp needs to be a second editiou to the Comstock at no great distant date.

F. W. S.

Bullion Shipments.

Alhambra Mill, March 8, $12,870; King, 8, $11,127; Richmond, 2, $18,293; Crescent, 5, $4,000, Germania, 5, $4,099; Stormont, 6, $3,100; Germania, 6, $3,955; Christy, 6, $3,600; Wood River ore, 8, $1,288. At Salt Lake the base metal and ore output for the week ending the 8th amounted to 18 cars of bullion and 16 cars ore. The weight of the bullion was 412,258 pounds, and the ore 438,930 pounds.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco:

MEXICAN DEVELOPMENT CO., March 11th; object: Introducing the electric light and electric motive power system throughout Mexico. Directors—J. Carlos Mexia, William M. Willey, Henry P. Burnham, R. B. Cunningham, Ricardo di Emparian, C. B. Stone, Thomas W. Temple. Capital, $290,000.

TULARE LAKE, LAND AND DITCH CO., March 11; object is blilding ditches for the purpose of conveying water from Tulare Lake and Kings river to the tillable lands of Tulare, Fresno and Merced counties. Capital stock, $500,000. Directors—Lansing Haight, William Strader, W. B. Douglas, B. J. Jenkins and David Moore.

Mining Share Market.

What interest there is in the stock market is centered on Hale & Norcross. The middle mines are the only interesting features in the market. Nearly all the fluctuations occur in them, and they are absorbing nearly all the attention of our brokers and speculators. The other stocks are dull and flat.

Hereafter the San Francisco Stock Exchange will throw its doors open to the public free at all times, except during regular sessions, and allow trading on the floor, providing the name of a member is given to bind transactions.

The *Post* states that a leading operator recently filled a line of shorts in Best & Belcher, Gould & Curry and the north end stocks, most of which he has had out for six years. Some of the stocks were put out at $6o per share, and filled for less than $1 per share.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SIGHT-PROTECTOR FOR FIRE ARMS.—John C. Kelton, S. F. No. 313,212. March 3, 1885. This is a cover for the front sights of rifles and carbines which serves to protect the sight from injury when the arm is not in use, and to shade the sight and assist in properly leveling the arm when aiming.

VALVE FOR WATER CLOSETS.—Wm. H. Gants assignee of one half to George E. Herrick, S. F. No. 313,314. Dated March 3, 1885. This is a new valve for admitting and checking a flow of water to a water closet, or other device or receptacle. It is especially useful in those places where the valve is dependent for its operation upon a float.

HARROWS.—C. W. McKelvey, Los Angeles. No. 313,357. Dated March 3, 1885. This invention relates to that class of harrows in which the teeth are adapted to rotate or revolve in a vertical plane, to clean or clear themselves. The invention consists in the peculiar construction and combination of devices, so as to provide a simple and effectual self-cleaning harrow.

FRICTION CLUTCH.—Geo. W. Bonds, assignee to Byron Jackson, S. F., No. 313,284. Dated March 3d, 1885. This friction clutch is for hoisting-drums, pulley-shafts, couplings, etc., and is now especially applicable to what are known as "wagon-derricks," in which winding drums are employed for operating derrick forks. It consists in a means for applying the clutching device so that the strain is applied without any pressure on the journals, and in certain details of construction.

REEFING UPPER TOPSAILS.—Robt. M. Belfrage, Cannonsville, N. Y., No. 313,279. Dated March 3, 1885. This is an improvement on the method of reefing upper topsails of vessels, by which the operation may be performed from the deck. The invention consists in the novel arrangement of the upper topsail reef-tackles, whereby the sail is adapted to be reefed to the lower topsail yard instead of to the upper one; in the arrangement of spilling-lines to spill or smother the sails, and in a false foot or ridge across the sail just above its foot whereby when the sail is reefed the false foot strengthens it.

IRONING TABLE.—Wm. H. Bell, Cloverdale, Sonoma Co. No. 313,280. Dated March 3, 1885. This adjustable ironing board consists of a board having toothed racks cut in the lower side, a pair of pivoted legs connected with one end of the board by a rod and open hooks, so that it may be detached, the upper ends of the legs being adjustable to the racks to raise or lower the table, and in connection with elastic straps, one of which extends from the center of the table to the center bar of the legs, while the other extends from the same attachment upon the table to the unattached upper ends of the legs.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY TO THE LABEL ON YOUR PAPER.

Picturesque Californian Homes.

A VOLUME OF

Forty Plates, Plans, Details and Specifications of Houses.

Costing from $700 to $15,000, and adapted to Families having Good Taste and Moderate Means.

CITY AND COUNTRY HOMES.

This work is designed to meet the wants of that large number of persons who have but a limited amount of money at their command, and in building a home wish to use it to the best advantage. Drawn by Samuel and Joseph C. Newsom, Architects, San Francisco, who have taken much pains in its preparation, and confidently assert that mechanics, clerks, salaried men, workingmen of every calling contemplating building, carpenters and builders in cities, towns and villages, will find this book a useful aid, worth many times its cost in the information and practical suggestions which it gives.

DESCRIPTION OF PLATES:

Estimated Cost Complete.

PLATE 1.—Modern House of 8 rooms and laundry in basement, elegant and spacious staircase, hard wood mantels, brick foundation, electric bells and speaking tubes, modern improvements..... $4,500

PLATE 2.—One story and three-quarter Picturesque Cottage, with observatory, suitable for elevated lot, 14 rooms..... 5,500

PLATE 3.—Picturesque Cottage of 7 rooms and bath 3,750

PLATE 4.—Residence now building at 16th and Union Sts, Oakland, Alameda Co., Cal. (S. Davisson, Esq., owner)..... 3,500

PLATE 5.—City Residence of 0 rooms, Queen Anne style..... 5,000

PLATE 6.—Residence, 0 rooms and bath, built on Capp and 22d Sts., San Francisco. (C. Evans, owner)..... 4,500

PLATE 7.—City Residence of 8 rooms and bath..... 3,300

PLATE 8.—Hardwood Mantels, with tile hearths and facings, suitable for dining and sitting rooms and parlors.....

PLATE 9.—Cottage of 6 rooms and bath room, wooden mantels..... 3,000

PLATE 10.—Plans and Elevation of a 4-room and bath cottage..... 950

Plan and Elevation of 3-room Cottage, bath in kitchen..... 700

PLATE 11.—Residence 11 rooms, picturesque..... 8,000

PLATE 12.—Dwelling of 7 rooms, laundry and bath room, now building at Eureka, Humboldt Co., Cal. 3,500

PLATE 13.—Plans, Elevations and Details of a Cottage of 5 rooms, observatory and bath; laundry and wood and coal room in basement; brick foundation; cathedral glass, etc..... 2,750

PLATE 14.—Residence built at Eureka, Humboldt Co., Cal. (D. A. Boyd, owner)..... 3,000

PLATE 15.—Large Picturesque Country Residence, 10 rooms, large hall, paneled in hard wood, cathedral glass, etc..... 12,000

PLATE 16.—Residence of 9 rooms, built on Broadway and Buchanan Sts. (O. Helmrich, Esq., owner)..... 6,000

PLATE 17.—Swiss Combination Dwelling of 7 rooms and bath..... 3,750

PLATE 18.—Summer Residence, 8 rooms and bath, built at Santa Rosa, Sonoma Co., Cal..... 4,500

PLATE 19.—Cottage of 6 rooms, in the Modernized Queen Anne style, recently built in Centerville, Alameda Co., Cal. (C. A. Plummer, owner)..... 2,700

PLATE 20.—Residence of 6 rooms and bath, laundry, electric bells, mantels, etc., Filbert and 15th Sts.; also, on Market St., near 8th, Oakland, Cal. (J. C. Newsom, owner)..... 2,400

PLATE 21.—Residence of 9 rooms and bath, built on Peralta Heights, East Oakland, Cal. (Chas. Newton, Esq., owner)..... 4,000

PLATE 22.—One three-quarter story Residence of 6 rooms and bath room, built on Peralta Heights, East Oakland, Cal. (Wm. Price, Esq., owner)... 2,800

PLATE 23.—Cottage of 6 rooms and bath..... 1,800

PLATE 24.—One story and three-quarter Cottage, built on 0th ave. and East 14th St., East Oakland, Alameda Co., Cal. (J. W. Evans, Esq., owner); also, seven different stair details..... 4,000

PLATE 25.—Residence of 0 rooms and bath, built in Stockton, San Joaquin Co., Cal. (Wm. Swett, Esq., owner)..... 4,000
Also, seven different kinds of doors and inside finish.

PLATE 26.—Suburban Farm House of 7 rooms and bath, built on J. Lancaster's, Esq., farm, Los Gatos, Santa Clara Co., Cal..... 2,700

PLATE 27.—Residence of 6 rooms and bath, designed for Dr. H. Gardiner, Santa Clara, Cal..... 3,500

PLATE 28.—Dwelling of 7 rooms and laundry; built row of eight for Col. Samuel Wood; 9th St., bet. Brush and West Sts., Oakland, Alameda Co., Cal.; also, details of finish of same; also, of fence. Each house..... 2,600

PLATE 29.—1. Plan of Cottage of 5 rooms, laundry and bath room..... 1,900
2. Plan of Cottage of 6 rooms, laundry and bath room..... 2,000
3. Plan of Cottage of 5 rooms, laundry and bath room..... 1,750

PLATE 30.—Suburban Dwelling of 9 rooms, laundry and bath room, built in Santa Rosa. (T. J. Ludwig, owner)..... 3,750
Also, one and three-quarter story Cottage, with tower, 6 rooms and conservatory..... 3,000

PLATE 31.—Queen Anne Dwelling of 14 rooms and bath room, large hall and easy stairs, onyx mantels, cathedral glass, etc.; also, details of chimneys and inside finish..... 12,000

PLATE 32.—City Dwelling, 11 rooms, dressing rooms and bath room; also, saloon chambers; also, dining room mantel..... 15,000

PLATE 33.—Cottage of 6 rooms and 2 servants' rooms in attic, built on San Pablo avenue, Oakland, Cal..... 2,500

PLATE 34.—Residence designed for J. Rosenthal, Esq., to be built on Pierce and Hayes Sts., San Francisco. Onyx and hard wood mantels, tiled gables and cathedral glass, connecting bedrooms, balconies, etc.; 10 rooms, laundry and bath..... 9,000

PLATE 35.—Residence of C. Hirsfeld, Esq., on north side of California, bet. Pierce and Scott, 10 rooms and bath..... 5,500

The Plans are clear, and finely drawn on Lithograph Plates, and handsomely printed; size, 9x13 inches.

Subscribers to this paper (old or new), who pay one year in advance of the date of application for this premium, can have the same by paying $1 additional. Sent by express unpaid, or on receipt of $1.10 post paid.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.
No. 252 Market St. Elevator, 12 Front St., S. F. Telephone No. 658.

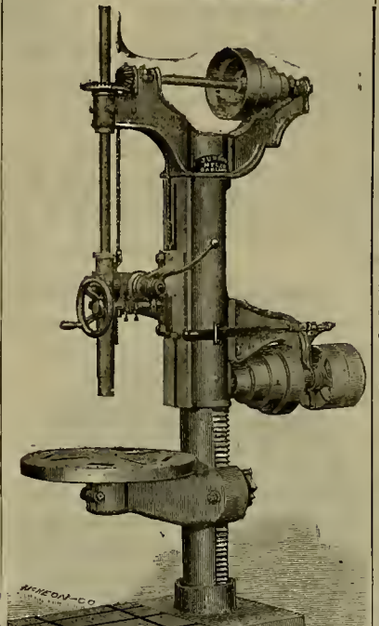
T. DEWEY. W. B. EWER. GEO. H. STRONG.

Land Business at Washington.

Having associated with us able counsel at Washington, we are now prepared to obtain Patents upon Pre-emptions, Homesteads, Mines, Mexican Grants, and all classes of Land Entries; and to manage contests before the Commissioner of the General Land Office and the Secretary of the Interior. Advice will be furnished upon favorable terms. All business will be attended to **promptly** and on **reasonable** terms.

DEWEY & CO., Patent Solicitors

DRILL PRESS.



The above cut represents our new 26-inch Drill. This pattern is new and extra heavy. The material and workmanship is first-class in every particular. The spindle and head is counterbalanced with chain and weight, with a vertical adjustment of 20 inches. The spindle is made of hammered steel, bored out to fit the No. 3 Morse Drill Socket, and has 8 inches of travel. The quick return attachment is very strong, simple and perfect in its action. The face-plate swings round the column in any position. Can be raised or lowered 18 inches, and will receive work 32 inches high and 26 inches diameter. The bed plate is planed, and will receive work 46 inches high. The pinion and rack for lowering the table is placed on the side and revolves with the table. In this position, the dirt and borings falling from the table cannot get in the rack.

The pulleys on lower cone shaft are 10 inches diameter for 3-inch belt, and should run 250 revolutions per minute. There are four belt speeds on cones, which are turned suitable for 2½-inch belt. Weight, 1,500 pounds.

Price, $275, less 10 per cent.

We also manufacture a Pulley Drilling Machine for drilling the set screw holes in Pulley Hubs without drilling through the outside rim. It can be attached to our drill in one minute, simply by removing the face-plate and setting pulley drilling attachment in the face-plate socket. This machine can be attached to any ordinary drilling machine. Weight 100 pounds. **Price, $50.**

JUDSON MANUFACTURING CO., 8 Pine St., San Francisco, Manufacturers of Machinery, Bar Iron, Files, etc. Finished Shafting, Pulleys and Hangers made to order.

HEALD'S BUSINESS **COLLEGE,** 24 Post St. S. F. Send for Circular.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

ENGRAVINGS FOR SALE.—Electrotypes of many of the engravings in this paper can be had (within a reasonable length of time after their appearance in our columns) on favorable terms, for job, book or newspaper printing.

N. W. SPAULDING SAW COMPANY

Manufacturers of SPAULDING'S **Inserted Tooth** AND **CHISEL BIT** CIRCULAR **Saws.**

NOTICE

Is hereby given that a meeting of the stockholders of the Lord of Lorn Gold and Silver Mining Company (a corporation) will be held on the 11th day of May, A. D. 1885, at one o'clock P. M., at the office of said corporation, in room No. 6, in building No. 318 Pine street, in the City and County of San Francisco, California, for the purpose and with the object: First, of increasing the capital stock of said corporation, so that the whole amount or par value thereof shall be $10,800,000, divided into 108,000 shares of the par value of $100 each; and, Second, to repeal the by-laws of said corporation, or any part thereof, and to amend the by-laws, or to adopt new by-laws therefor, as said meeting may determine. By order of the Board of Directors and Trustees, and of the President. March 7, 1885. JAS. T. McDOUGALL, President.
R. N. VAN BRUNT, Secretary.

FOR SALE—TITLE U. S. PATENT.

A one-half interest, or the whole, of a valuable GOLD MINE, situated in the Quartzburg Mining District, Mariposa County, Cal. This Quartz Mine prospects from $30 to $90 per ton in gold upon the pay streak, and will pay $15 per ton, average, for all the ores. It is a 3-foot ledge, and a double compartment shaft is now down 200 feet. A mill and reduction works are now well under way; a boarding-house completed, and a water ditch, and a large part of the machinery bought and erected; roads made, etc. The only reason for selling any part is, that the owners lack sufficient means to put the property into productive shape. For further information address, GILBERT CLEMENTS, 318 Front St., San Francisco.

FOR SALE.

Patent right, with all the patterns, for manufacturing the well known Patent Square Amalgamating Pans.
Address STRONG & CO.,
10 Stevenson St.

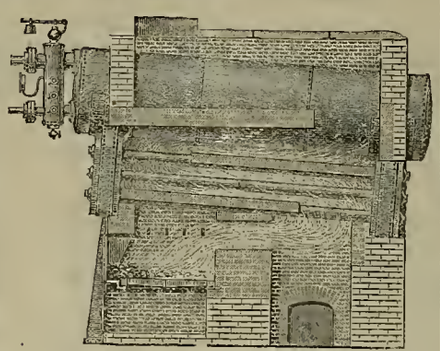
Manufacturer of all kinds of Chemical Stoneware
—FOR—
Manufacturing Chemists.
Also Chemical Brick Gloover Tower.

HOOD'S FOUNDRY COKE.
Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."
This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.
BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

HEINE PATENT SAFETY BOILER.
RISDON IRON AND LOCOMOTIVE WORKS.
Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.
FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.
Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.


TESTIMONIALS.
SAN FRANCISCO, Sept, 19, 1884.
Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.
SAN FRANCISCO, Oct. 4, 1884.
Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

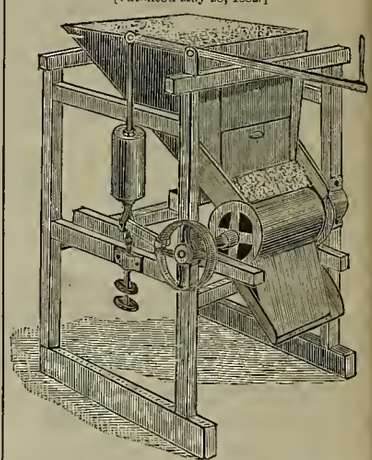
THE ROLLER ORE FEEDER
[Patented May 28, 1882.]


This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "**Jenkins Standard Packing,**" and is for sale by the Trade generally.

For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Manufactured only by JENKINS BROS., 71 John St., New York.

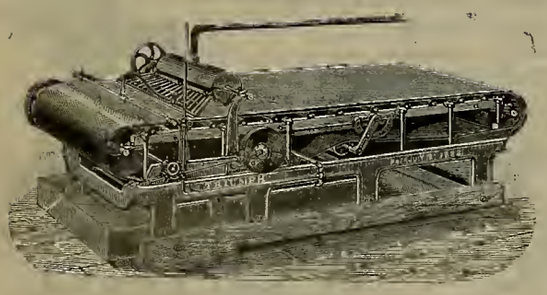
$1,000 CHALLENGE ACCEPTED!



THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue" Vanning Machines**, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000**, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

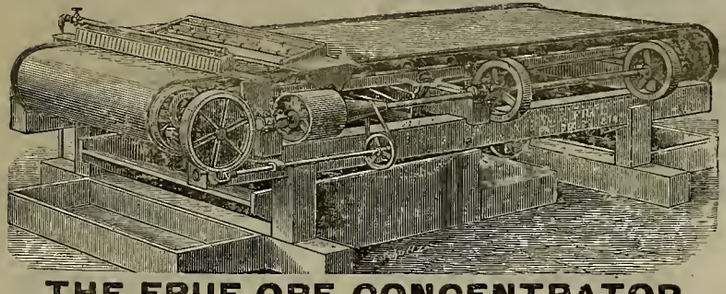
We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St., San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

....BUILDERS OF....

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

HOISTING WORKS

Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

Adapted to all Requirements.

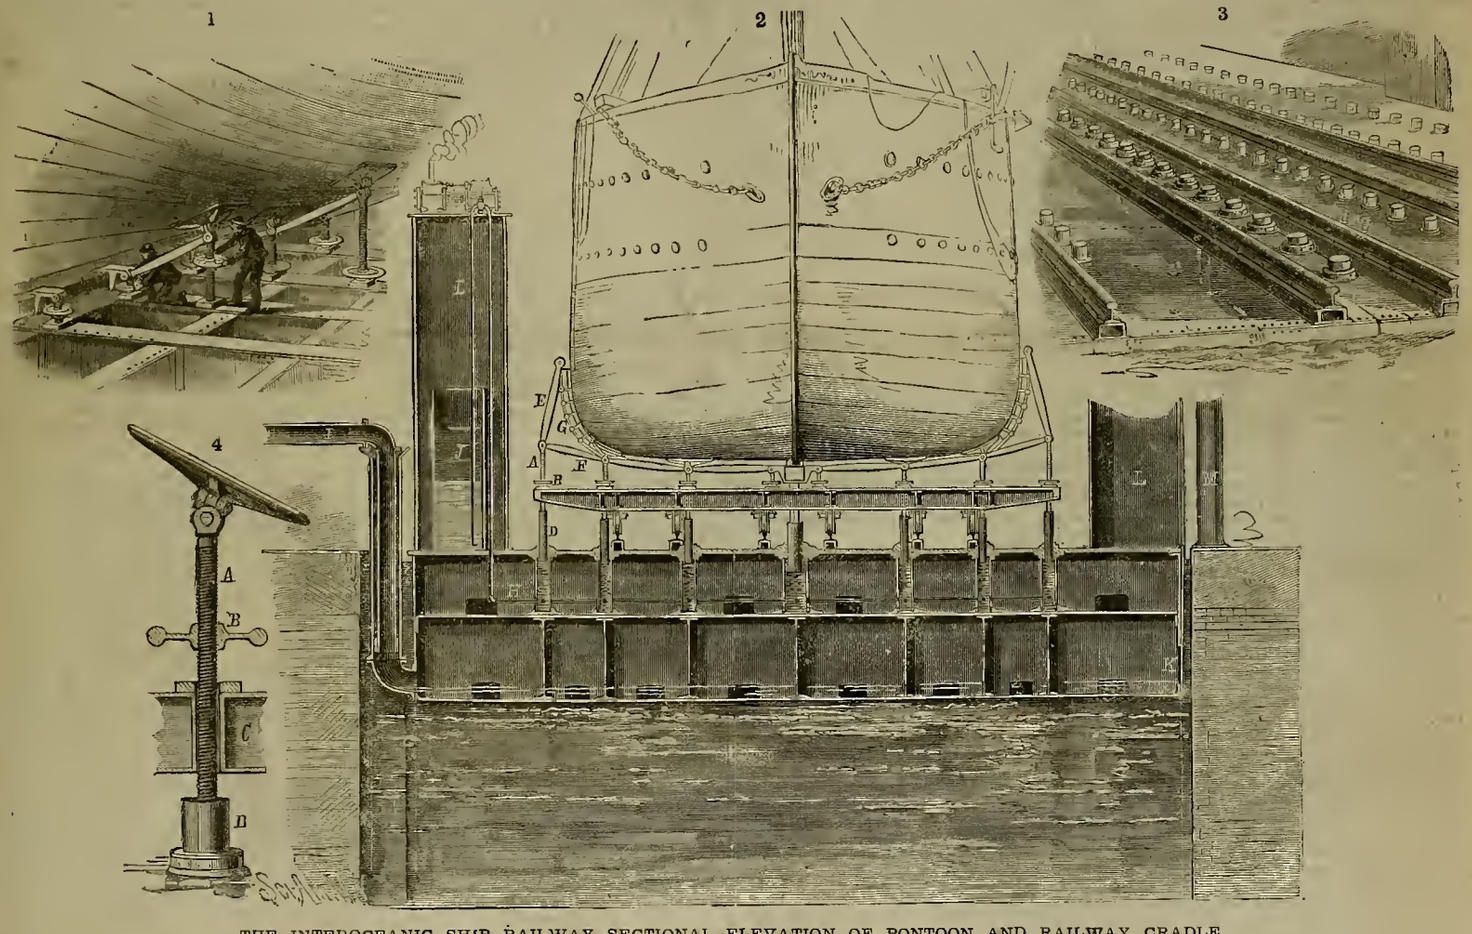
The Interoceanic Ship Railway.

The attention of the whole world has been turned to the projects for getting vessels from the Pacific into the Atlantic, and *vice versa*, across the Isthmus, so as to save the long and expensive sea voyage around the cape. The engineering difficulties are great, and opinions are at variance as to the best means of overcoming them. The transisthmian projects which for many years have attracted the attention of engineers may be divided, perhaps not improperly, into three classes: 1st. Those in which the construction will be at the mercy of floods. 2d. Those lacking good harbors. 3d. Those which empty into the Doldrums or Zone of Calms. Of these three fatal objections, the Panama tide water canal scheme is open to the first and third, and the Nicaragua lifting-lock plan to the second and third. The ship railway project of Mr. James B. Eads, illustrated in this number is open to neither of these objections. It is not so costly, and will shorten by considerably over 1,000 miles the contemplated route via Panama between the Atlantic States and this city or the East Indies.

This project of the ship railway is one devised by Mr. James B. Eads, the distinguished engineer, perhaps best known for the successful engineering displayed in the designing and construction of the Mississippi jetty system, which other engineers said would not work and which does work. The idea is a novel and original one, though it seems strange that no one ever thought before of its practicability. Mr. Eads hit upon the plan while studying the various canal projects, neither of which did he approve. He, of course, studied up carefully what might be brought forward as objections to his plan, and prepared to move its practicability.

He saw that by means of the ship railway he would reduce the distance from New York to San Francisco, necessary for vessels to traverse, which is 15,687 miles by way of Cape Horn, by some 10,000 miles; and from New Orleans to San Francisco from 16,112 miles to something less than 4,000. He knew there would be difficulty in making people believe the plan feasible. He remembered the difficulty of introducing hydrogen gas in London, of sending the first vessel across the Atlantic under steam, of substituting the screw propeller for the paddle wheel, and how the orignal projectors have been scoffed at. Mr. Eads knew that ships had been going on and off lifting docks without injury from time immemorial, and was sure that vessels that could safely withstand the terrible buffeting of ocean waves could be moved over a smooth roadbed without fear of injury. In order to be sure as to the roadbed, he took with him to the Isthmus, Mr. J. J. Williams, an able engineer, who had made several surveys for interoceanic railroads and canals, and Mr. E. L. Corthell, who had successfully carried out his plans at the mouths of the Mississippi, and is an expert in railroad construction, having been chief engineer of the West Shore Railroad. Being a practical man, Eads, naturally sought to discover a route that would furnish a substantial roadbed, possess something in the shape of harbors at either end, and above all a location outside of that, to the mariner, vexatious belt of perpetual calm. He found a cross section of the Isthmus of Tehauntepec which combined all these qualities; nay, more, for of all the routes across the narrow strip of land joining Mexico with South America, none shortens so much as this, the voyage from the Atlantic and Gulf States to California.

Having selected the site for his ship railway, he now sought a concession from the Mexican Government. This was obtained in 1881, and extends over a period of ninety-nine years from its date. It authorizes the construction across the Isthmus of Tehauntepec of a ship railway, an ordinary railway, and a line of telegraph. Besides this, it exempts all ships and merchandise *in transitu* from government duty, grants the concessionaire a million acres of public land, and guarantees protection during the construction and consequent operation of the works. To crown all, the right is given the company to obtain the aid of any foreign government, and in consideration of this assistance the company is authorized by the terms of the concession to discriminate in favor of the commerce of such government against that of all other countries, save, of course, Mexico. The concession obtained, Mr. Eads set about having a careful survey made, topographical and physical, for the several previous surveys were with reference to a canal or an ordinary railway.



THE INTEROCEANIC SHIP RAILWAY—SECTIONAL ELEVATION OF PONTOON AND RAILWAY CRADLE.

The length of the whole railroad line will be about 134 miles from Atlantic to Pacific. Beginning on the Atlantic side, the route will start from the Gulf of Mexico, the ships sailing up the Coatzacoalcos river to Minatitlan, a distance of about 25 miles. From Minatitlan there extends for about 35 miles an alluvial plain having an underlying alluvial stratum of heavy, tenacious clay. On the high land and ridges clay, loam and sand are found. Next comes an undulating table-land, and then irregular mountain spurs of the main Cordilleras, run through the entire continent, making at this point one of the most marked depressions to be found in its whole length. From this basis the line passes through a valley formed by a small stream to the plains of Tarifa, where is situated the summit of the line. This is 736 feet above low tide. After traversing these

(*Continued on page 190.*)

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The New Gold Era.

EDITOR MINING PRESS: Your remarks week before last to the effect that we are on the eve of a new gold era in California, are pertinent and timely, being beyond any question fully warranted by the present situation in this State. The term "New Gold Era," is happily chosen, as it exactly expresses existing conditions, and the outlook here at this moment. There is certainly about to occur in this State a great expansion in the business of gold mining, the reasons for the sams being partially indicated in your editorial remarks, above referred to. Whether or not investors abroad are taking any more interest in that line of business than usual, is a matter about which I am not informed. That our own people, more especially the residents of the mining districts, are paying increased attention to it, is abundantly evident. Look where we will we see signs of renewed life and activity, quartz and drift operations, since the check given to hydraulic mining in its strongholds, having each experienced a decided impetus.

What you say in the PRESS about the mineral discoveries recently made in the Washington district and in the New River country is, I douht not, fully warranted hy the facts. As to the hydraulic deposits along the Klamath river, also alluded to, I can testify of my own personal knowledge that they surpass in value the most flattering accounts I have anywhere seen of them. These deposits, as you remark, do in themselves really amount to a great gold field. The linear extent of the auriferous territory along that river may, in some instances, have heen overestimated.

The gravel range on the Klamath, measured as the gravel deposits occur at intervals along it, do, indeed, reach for more than a hundred miles. Continuously, however, their extent is much less. Still, the material exsits there for many large operations and under couditions so favorahle, that one is surprised the field should have heen so little occupied. There are, along that river, opportunities for inaugurating anywhere from 20 to 30 hydraulic enterpriscs that, under anything like a good management, could not fail to prove eminently successful.

That this region has remained so long neglected is due mainly to its remoteness and difficulty of approach. Lying at the extreme northerly end of the main gold belt, hedged in by mountains, and far from railroads and navigable waters, it cau he reached only by a tedious and expensive journey. There obtains in this region the most primitive condition of tbings to he found in any part of California, there heing much here to remind one of '49 times. This is the only populous district in the State that remains without a wagon road connecting it with auy of the great water or land thoroughfares leading to San Francisco. From Fort Jones, at the lower end of Scott's Valley, or from Crescent City, on the coast, all goods are packed in on animals, these places being distant from Happy Camp, the cantral point, 70 and 90 miles respectively. A wagon road could he built from either of the above places at a moderate cost, yet the inhabitants, ahle to live iu a sort of easy independence, have never taken any action to that end.

As a matter of course, not much capital has, as yet, found its way into this regiou, nor have the inhabitants ever done much to induce it to come there. Nevertheless, I think there offer here some good openings for the employment of money, and would suggest to investors the wisdom of having the country examined to that end.

As thess [are hydraulic deposits, none but a person thoroughly conversant with that hranch of mining should he selected for the duty of making such examinations. Let a man like A. J. Bowie Jr., who is well up in hoth the theory and practice of the business, he sent on such errand, or equally well, send a man like James L. Gould, of Gold Run, George D. McLean, of Grass Valley, or James P. Pierce, James O'Brian, or Daniel McGanuey, of Smartsville, or any one of a dozen Californians who might justly he chosen for such service because of their long and successful experience in hydraulic mining, and I will answer for it there will he no disappointment, whatever the course either of these men may recommend the investor to pursue. With the approval of any one of them I think these mines on the Klamath might safely he taken hold of—condemned hy any one of their membor I should he disposed to let them alone. HENRY DEGROOT.

San Francisco, March 1-, 1885.

Tuolumne and Mariposa.

EDITORS PRESS:—The Red Cloud mine Co. in Mariposa county, a short distance from this place, have lately struck a rich hunch or "pocket" in their vein; it is estimated that they have taken out over $30,000. The company have frittered away considerable money in "pulverizers," "centrifugals" and other new fangled mills. They have now come down to the hard pan of good common sense, and will erect a stamp mill.

Lang and Shaw have their ten-stamp mill completed and will start up in a few days.

Ben Hunter is pusbing things on the Mt. Zion mine.

Richards, Tarwater and Tom Reid struck a good pocket on the Sonora road ahout half a mile from the town of Groveland, the rock was seen hy the writer and is no douht worth fully $2,000.

There is considerahle milling rock in sight. This pocket was only three feet to one side of main traveled road.

Between Waid's Ferry in Tuolumne county and Greely's saw-mills in Mariposa county there is perhaps a better country for prospectors and men who are on the work, provided they have a little means on which to prospect, than the hoasted New River or outside Territory mines. MICKEY FREE.

Groveland, March 7.

Mining Laws.

Locating Claims On Holidays.

A recent decision of the Secretary of the Interior, relating to the locating of mining claims on holidays, has attracted considerahle attention from the mining community, and some persons have thought these rights had been jeopardized. We have mentioned that the case referred particularly to Colorado, hut as the subject is one of great moment, we give Secretary Teller's decision entire, so that miners may understand the question in all its hearings. The decision is one which was addressed to the Commissioners of the General Land Office hy the Secretary of the Interior, and is as follows:

This claim was located in April, 1879, and application for patent was filed August 27, 1880. It was adversed hy claimauts of the Brian Boru Lode, alleging conflict with their claim to a narrow strip of surface ground. Suit was commenced thereon, and judgment rendered in favor of these claimants, January 28, 1882. On the same day the Favorite Lode claimants made entry for the remainder of their claim. On January 30th, McNeil *et al.* protested against issuance of patent on said entry, alleging failurs on the part of the applicants to expend one hundred dollars ($100) in lahor or improvements on their claim during the year 1881, whereby it became forfeited, and the premises hecame subject to relocation; and that the protestants relocated the same January 1, 1882, as the Oro Boys Lode claim.

It satisfactorily appears that the applicants complied with the requirements of the law, prior to the year 1881; that whatever

Assessment Work

They did during the year was doue in the month of December, and they did no work after the expiration of that year. The whole case is therefore narrowed to the single issues of whether or not the applicants performed the required labor or made the required improvements upon this claim during the month of Decemher, 1881; and if not, whether they performed such lahor or made such improvements upon the adjoining Continental Lode claim, of which they were owners, so as to answer the statutory demand in respect to the Favorite claim, and whether the premises were subject to relocation by the protestauts January 1, 1882.

Sec. 2324 R. S. provides that "on each claim located after May 10, 1872, and until patent has been issued therefore, not less than $100 worth of lahor shall be performed or improvements made during each year; * * * but where such claims are held in common, such expenditures may be made upon any one claim, and upon the failure to comply with these conditions, the claim or mine upon which such failure occurred shall he open to re-location in the same manuer as if no location of the same had ever heen made, provided that the original locaters, their heirs, assigns or legal representatives have not resumed work upon their claim, after failure and before such location."

It appears from the testimony submitted at a hearing, to ascertain the facts, that on Decemher 1, 1881, a written contract was made hetween the owners of the Favorite claim and one Williams, hy which the latter

Agreed to Develop this Mine

By tunnels and cross-cuts to the extent of at least 50 feet; said development to include the assessment thereon for the year ending Decemher 31, 1881, as required hy law, and to do and complete said assessment to the full value of $100, within the time named. The size of the tunnels was agreed upon, and the whole work was to he done "with a view to develop said mine on a systematic plan," and to "its permanency and full security;" and in compensation of his services, said Williams was to receive three-fourths of the net proceeds of all the pay ore extracted from the tunnels and cross-cuts during the continuance of the agreement, viz., to May 1, 1882. Williams forthwith commenced work upou the mine, assisted by his hired man, Johnson. The two worked upon sundry days during the month—sometimes together, and sometimes separately. Williams testifies that he kept a memorandum of such work (which he recites in detail), and that the value of their work, at miners' ordinary wages, amounted to more than $100. Johnson could not he found, and was not a witness at the hearing, but his affidavit accompanying the protest was filed, to the effect that not more than four or five days' work was done by both himself and Williams, the value of which did not exceed $15, and that no work was done hy either after December 24 h. In a later affidavit he says that he and Williams were working together upon several other mining claims during that month, and that he remembers of working himself for five days upon the Favorite, and may have worked more. He does not distinctly remember as to this, hut he does remember that he worked all day on this mine upon Saturday, Decemher 31, 1881. His general want of remembrance, and his contradiction in these affidavits upon material points, weaken his whole testimony, and do not detract from that of Williams. There is much conflicting testimony as to the value of this work; the witnesses for applicants testifying, in the main, that it amounted to $100 or more, and those for protestants that it was a less sum. But they all express opinions merely, without knowledge of the actual time expended by Williams & Johnson. Williams is the only witness who knows the real facts, and I find nothingin the case to discredit his testimouy.

Holidays.

But whatever might he the conclusiou in this respect, there are other questions pertinent to subject matter. The statutes of Colorado (p. 538, ed. of 1883), make certain days, among which is that of January 1st, holidays, and provide that in case any of said holidays fall upon a Suuday, then the Monday following shall he considered as the holiday. Sec. 137 (p. 51) of the Civil Code of Colorado, provides that a District Court of the State, or any judge thereof, shall have power to issue writs of injunction for affirmative relief, having the force and effect of a writ of restitution, restoring any person or persons to the possession of any mining property or premises from which he or they may have heen ousted by fraud, force or violence, or from which he or they are kept out of possession by threats or by words or actions which have a uatural tendency to excite fear or apprehension of danger, or whenever such possession was taken from him or them by entry of the adverse party on Sunday, or a legal holiday, or while the party in possession was temporarily absent therefrom; the granting of such writ to extend, however, only to the right of possession under the facts of the case, in rsspect to the manner in which the possession was obtained, leaving the parties to their legal rights on all other questions.

Sec. 1, ch. 41, of the Colorado statutes provides that no person shall enter upon or into any laud, tenements, or other possessions, except in cases where entry is given by law, and then only in a peaceahle manner; aud section 2 provides that if any person or persons shall enter upon any mining claim with force or a strong hand, whether any person be actually upon or in the same at the time of such entry or not, or if any person shall enter peaceably upon a mining claim, whether any person he actually upon the same at the time of such entry or not, and shall by words or actions which have a tendency to excite fear or apprehension of danger, frighten the party out of possession and retain and hold the same, or shall by such words or actions

Intimidate the Party Entitled to Possession

From returning upon or possessing the same, or shall hold and detain the same, the person or persons so offending shall be deemed guilty of a forcihle entry and detainer.

Sec. 30 (p. 726) of these statutes provides that in all cases when two or more persons shall associate themselves together for the purpose of obtaining the possession of any lode then in the actual possession of another hy force, violence, or hy stealth, and shall proceed to carry out such purpose by threats against the party in possession, or shall make any threats or use of language, signs or gestures, calculated to intimidate any person at work on said property from continuing to work thereon, or to iutimidate others from engaging to work thereon, they shall he subject to fine and imprisonment.

It is clear from the testimony that Williams and Johnson (or one of them) worked on this mine December 31, 1881; that when they left it on that evening their working tools were left there with the

Intention of Resuming Work;

That Williams returned to it early Monday morning for that purpose, hut found the mine in possession of protestants, who were armed, and informed him of their possession and that he could not work upon the mine. This possession was obtained after miduight of December 31, 1881, and prior to 7:30 o'clock A. M. January 2, 1882—upon Sunday, January 1st, or upon Monday, January 2d, which was a holiday—hy stealth, in the temporary absence of the applicants in violatiou of the laws of Colorado; and the applicants were prevented from continuing their work hy the language and conduct of the protestants, also in violation of said statutes. It was therefore a possession illegally acquired, and did not give the protestants the right to relocate the premises. A tortuous entry is unavailing for the purpose of a valid location of a mining claim. (Belk *vs.* Meagher, 104 U. S., 285). The Court further say in this case, that a mining claim perfected under the law is property in the highest sense of the term; that such claims are not open to relocation until the rights of a former locator have come to an end; that a relocator cannot avail himself of mineral in the puhlic lands until the discoverer has in law ahandoned his claim and left the property open for another to take up; and tbat a relocation on lands actually covered at the time by another valid and subsisting location is void.

In North Noonday Mining Co. *vs.* Orient Mining Co. (6 Sawyer, 299) the Court say: "Ths statute nowhere authorizes a person to trespass upon or relocate a claim hefore properly located hy another, however derelict in performing the required work the first locator may have been, provided he has returned and resumed work and is actually engaged in developiug his claim at the time the second locator enters and attempts to secure the claim." See also Jupiter Mining Co. *vs.* Bodie Cons. Mining Co., (7 Sawyer, 96.)

The present case is within these rulings. The applicants had not by intent or in fact ahandoned their claim, hut were in its actual possession, engaged in its development, when the protestants, hy a tortuous entry, attempted their ouster. Such action was illegal, and did not deprive the applicants of their rights, which remained the same as if they had completed their assessment work in 1881, even if this were not in fact done; with the right also to prosecute said work in 1882, and until a valid relocation was made hy another.

There is another conclusive

Objection Against the Forfeiture

Of applicants' claim on the ground alleged. The Continental Lode claim is adjoining to and parallel with the Favorite claim. They are both owned by the applicants. The required assessment work for the Continental for the year 1881 was performed. Work on the Continental was with the intent also to develop the Favorite. A drift in the former was run in the nirection of the latter, under the advice of mining experts, with reference to improvement of both. Work on the Continental was therefore, under the law, work on ths Favorite. The Court say, in Mt. Diahlo M. & M. Co. *vs.* Callison, (5 Sawyer, 439), "Work done outsids of the claim, or outside of any claim, if done for the purpose and as a means of perfecting or developing the claim, as in the case of tunuels, drifts, etc., is as available for holding the claim as if done within the houndaries of the claim itself. One general system may he formed well adapted and intended to work several contiguous claims or lodes, and when such is the case, work in furtherance of the system is work on the claim intended to be developed hy it." See also Smelting Company *vs.* Kemp, 104 U. S., 636, and Jackson *vs.* Rohy, 109 U. S., 440.

I am of the opinion that under the testimony the required assessment work for 1881 was done on the Favorite mine; but if there is douht of this under the conflicting proofs, then that the protestants, upon whom was the burden of proof, have failed to preponderate the same in thsir own favor, and thus show the delinquency of the applicants and establish their own claim. In Mt. Diahlo *vs.* Callison (*supra*) the Court say, "Forfeitures have always been deemed in law odious, and Courts have universally insisted upon the forfeiture heing made *clearly apparent* before enforcing it." For these reasons, as well as for what is above said in respect to work on the Continental mine, I think ths protest should be dismissed, and affirm your decision.

THE "SANTA ROSA."—Of the large line of steamers plying up aud down the coast, the *Santa Rosa* is rated ths best. The *Queen of the Pacific*, huilt and owned hy the Pacific Coast Steamship Company, the same company that owns the *Santa Rosa* and other coast steamers, for awhile was at the head of the list. Both are magnificent ocean steamers, most elegantly fitted and furnished, but the *Santa Rosa* has a slight advantage in speed. She has made the 200-mile trip from San Francisco to Port Harford, the San Luis Obispo port, in 12 hours and 11 minutes. She made the trip from New York to San Francisco, "around the Horn," in 45 days, which is the fastest long dis ance time on record. A representative of this paper recently had occasion to make the passage to San Diego on the *Santa Rosa*, aud experienced a very pleasant trip. The vessel is a modsl of heauty in hoth outline and interior decoration, being furnished in mahogany and cherry, paneled with embossed leather, and lighted throughout with the Edisou incandescent separable lamps. Her commander, Captain Johnson, is an efficient officer and a courteous and popular gentleman, and together with all his subalterns makes the comfort and safety of his passengers his first and last thought.—*Pacific States Watchman.*

THE outcome of the freight war cannot be guessed. It is believed that the cut hy at least one of the transcontinental lines has become so open that an investigation will be had, aud that many of the association lines will be implicated. The lines that are doing the cutting will maintain that the Transcontinental Association has lapsed, and that in cutting they have not violated the agreement formulated at the recent meeting of the association in this city, and which has not, as yet, been signed hy all the roads. On the other hand, the association will claim that the Executive Committee, hy its action in extending the time for signature to April 1st, hinds all the roads in the pool, aud if the charges against certain lines are made to stick, the roads will suffer hy the payment of heavy fines.

ALTHOUGH the Yosemite valley has heeu announcsd as open, and two parties have left via Madera within a fortnight, the reports received would indicate that the roads in the valley are in anything hut a fit condition for travel.

MECHANICAL PROGRESS.

[illegible] Friction.

M. Hirn communicates to the *Academie des Sciences* some observations on friction, with particular reference to machines and motors. He has arrived at the conclusion that there is a great difference between the friction of two surfaces sliding one upon the other, according as they are dry or separated by a layer of lubricating material. In the case of what he calls the *immediate* friction of bodies (*i. e.* those surfaces which are dry,) the co-efficient of friction is independent of velocities, areas or load. It is otherwise with the other order of sliding bodies, in which, as is generally the case, the surfaces are separated by an unctuous layer. Here the co-efficient of friction is always a function of the velocity, the load, and the extent of the sliding surfaces. It is difficult to arrive at exact laws which regulate the phenomena. The quantity of lubricant drawn under the rubbing surfaces by their movement, the temperature of the lubricant, etc., are capable of modifying the value of the co-efficient of friction many times in the course of a single experiment.

It may be broadly stated that, in the general condition of the ordinary machines, the power necessary to overcome friction is proportional to the square roots of the sliding surfaces and of the load, and (when the lubrication is abundant) to the velocity. The influence of velocity is above all complex. With great velocities, or at least when the loads are light in comparison with the frictional surfaces, a great number of liquids, very different from oils or fats, become lubricants. Air, under certain conditions, when brought in sufficient quantity between the sliding surfaces, becomes the best of lubricents; the co-efficient of friction being thereby reduced to one ten-thousandth. When, on the contrary, the speed is too low, or the load relatively too heavy, the unctuous matter may be expelled. The friction then becomes immediate, with a co-efficient rising to one one-hundredth or one-fifth. M. Hirn points out that these views are supported by some observations of M. Duprez, who found that the co-efficient of friction of a given machine, determined for a certain velocity and state of lubrication, diminished as the speed increased and the oil became warm; while, when the velocity was much diminished, the lubricant was no longer drawn between the surfaces in sufficient quantity, and the contact became as metal to metal.

United States Machinery in England.—The respect which the United States mechanical inventions have forced from British manufacturers and machinists, has originated the use of very different language by critics to that which was at one time indulged. When such people talk we do not hear much of the phrase "Yankee notions." A paper by Mr. George Richards, of Manchester, was read at the last meeting of the English Institute of Mechanical Engineers, giving an account, illustrated by diagrams, of improvements which had of late years been made in machinery for wood cutting, and especially in those known as the finishing class of machines, which were developed earliest in America. Mr. Richards put it in a very mild way when he said that the rapid manner in which these improvements had made their way in England showed that very little prejudice existed there with regard to the adoption of foreign ideas. For "foreign ideas" he probably intends that we should read American. Perhaps the prejudice will be much less when America has at the forthcoming International Inventors' Exhibition in London shown amongst other machines that one to which Sir Frederick Bramwell, as president of the Council of the Exhibition, has already asked the attention of the world.

A New Method of Melting Iron.—A new method of melting iron has been devised in Germany. The cupola is supplied with blast through two tuyeres, one above the other, there being 18 in each set; the tuyeres are ports, with the form of a vertical slat, directly connected with a tuyere ring. The particular feature of the cupola is that the bottom is a slightly inverted arch, which is pierced by two openings, through which both blasts, or rather imperfectly consumed gases of combustion, and the fluid iron, can flow. Below is a small chamber, in which the iron collects; it is heated by the gases forced downward from the cupola above, these being supplied with the necessary air for combustion by a small tuyere leading from the main blast pipe—the chamber at the same time serving to pre-heat scrap, etc., which need only be pushed into the bath for dissolving it. Of course, considerable quantities of scrap can be used by directly charging an ordinary cupola; but it is claimed that in this case the advantages presented are economy of fuel, and a greater facility for making sharp, strong castings and a purer description of metal.

Steel for Underground Colliery Purposes.—A novel feature, which may lead to a large demand for steel for underground colliery purposes, has been introduced by the Darlington Forge Company, which is executing considerable orders for large sections of channel steel to be used for roof beams in the place of wood in pit workings, and steel props are also making for supporting the roofs. The first cost of steel for beams and props is, of course, in excess of the wood supports at present used; but an ultimate saving will be effected in that they can be removed for further use without damage, which to a very large extent is not the case with wood, while an additional and very important advantage is secured in that much less space is occupied as compared with the heavy timbering now required, and a better working headway in the mine is obtained.—*Iron.*

Compositions for Cementing Iron.—According to the Technische Commerz *Zeitung*, a cement which will resist heat and water may be made by combining ten parts of lime, five of iron filings, two of vinegar and three of water; for objects which have to be heated, 100 parts of iron filings, 50 of clay, 10 of common salt, and 20 of quartz sand; for a black iron cement for iron ovens, 10 parts of iron filings, 12 of sand, 10 of boneblack, 12 of slacked lime, and five of lime milk; for fastening iron to stone, the composition may consist of 10 parts of fine iron filings, 30 parts plaster of paris, and one-half part sal ammoniac, these to be mixed to a fluid paste with weak vinegar, and applied at once; for a cement for iron cisterns, the finest iron filings are to be mixed with vinegar, which is to be allowed to stand until it becomes brown, and the mass is then pressed into the joints, of course, closely and firmly.

The Hammer in Forging.—Sir Frederick Bramwell, the President of the English Institute of Civil Engineering, declares that for the large steel forgings required in the present day for engine shafts and for cannon the operations of light steam hammers are positively hurtful, tending to produce internal flaws, and that the blows of even the heaviest hammers are less efficacious than pressure applied without a blow. He thinks the time is not far distant when all steel in its molten state will be subjected to pressure with the object of diminishing the size of any cavities containing imprisoned gases, or else that the same result will be obtained by other mechanical means, the possible nature of which he does not specify, but by which a casting may be obtained free from all blow-holes, so that, when afterward forged by pressure, and not by percussion, it may be trusted to contain no local defect.

The Use of the Power Indicator.—The importance of a careful study of the power required to run the different machines or departments of a shop or factory is well exemplified by the following: A recent test by indicator at a veneer mill, on Medford street, Boston, developed some interesting details. The friction of engine and shafting required 24.36 indicated h. p. The 56-inch Boston blower, for sawdust required 38.90 h. p., running 1,100 revolutions per minute. Here is a serious loss. Either the blower should be run slower or a different arrangement made. The use of the indicator would open the eyes of many a manufacturer who thinks it takes a large quantity of steam to run a stated amount of machinery.

A Fruitful Source of Damage done to boilers, and one which has ruined thousands, is the practice of blowing a boiler off and immediately refilling it with cold water, while the brickwork is red hot. The *Age of Steel* believes that nothing will tear a boiler to pieces quicker than this. Boilers have exploded with disastrous effect from this cause after the fire had been drawn. Probably most persons not familiar with the matter would be surprised to know the pertinacity with which cold water will cling to the lowest point of a boiler under these circumstances. Local contraction of such severity is thus induced that nothing can withstand its effects, and a few repetitions are generally sufficient to ruin any boiler.

Strengthening Steel.—In the course of experiments in France for the working of steel, M. Clemandot has developed the following process: He takes steel already made, heats it to a cherry red, and submits it by hydraulic means to a pressure of from 1,000 to 3,000 kilos per square centimeter. After the steel has been allowed to cool between the two plates of the press it is withdrawn, and found to possess a fineness of grain, a degree of hardness and strength to withstand rupture, superior to the qualities obtained by any other process. The alteration is most marked in highly carbonated steel.

To Detect Imperfections in Iron.—If a piece of iron appears to have an unsound weld, or if it has a crack apparent upon its surface, and it is desired to know how deep it penetrates, heat the part to be tested to a red heat and pour a fine stream of water on the faulty spot, but mainly on one side of it, and the iron on that side will lose its redness more rapidly than the other side, and plainly indicate how deeply the defect extends.

The Strength of Shafting.—To determine the size of shafting (wrought iron) Sellers, of Philadelphia, uses the following formula: Multiply the horse-power which it is desired to transmit by 125, and divide the product by the number of revolutions per minute, and the cube root of the quotient is the diameter of the shaft in inches.

Alloys are often difficult to make. It has been found that the presence of even 1-30,000 of a pound of antimony in a pound of melted lead increases the rapidity with which the lead oxidizes and burns. Lead which contains more than 1-1,400 of its weight of copper is unfit for the manufacture of white lead.

SCIENTIFIC PROGRESS.

Erroneous Ideas in Regard to Snakes.

Rheem, who has charge of the reptile specimens in the Smithsonian Institute, contradicts much of the popular belief as to snakes. Some of the most dreaded have no existence. The hoop snake, which takes the end of its tail in its mouth and rolls over and over like a hoop, killing everything it touches with its venom, and the blow snake, the breath of which is deadly, are fictions. As serpents move about they are constantly feeling ahead with the tongue, and the forward thrust and peculiar forked appearance of the organ has given rise to the false idea that with it the stinging is done. It is generally thought that there are a great number of poisonous snakes. In North America there are but three species—the rattlesnake, the copperhead or moccasin and the coral. There are about 30 varieties of these species altogether. The copperhead is probably the most dangerous, as it is vicious, and never gives warning of any kind before striking. The rattlesnake, though more poisonous than either of the others, will rattle at the approach of anything, and try to get away unless brought to bay. The coral is much smaller, and a native of the Southern States. The bite is not necessarily fatal if the proper remedies are used in time, as, on account of its size, the quantity of poison is small. When a reptile strikes he throws his whole body forward, and the fangs penetrate the object against which they come. He does not jump; the hinder part of the body remains in position, and none of our snakes are in the habit of reaching more than half its length.

Perspiration of Plants.—All plants give off moisture from their leaves, even though this is invisible to the eye, just as our skin is always perspiring, though the sweat may not stand in drops. This can be seen if a plant is grown under a glass shade, in such a manner that no evaporation can be given off by the earth or water in which it is grown. Nevertheless, in a few hours the inside of the glass will be dimmed by the moisture given off by the leaves, which has condensed on it. Calculations have been made as to the amount of water thus perspired by plants. A sunflower only three and a half feet high, with 5,616 square inches of surface exposed to the air, gives off every twelve hours twenty to thirty ounces avoirdupois of water in this form, which is more than a man does. Most of the common agricultural plants, such as wheat, beans, peas and clover, exhale during the five months of growth more than two hundred times their dry weight of water. The cornelian cherry is still more remarkable. In the course of twenty-four hours it exhales water equal in weight to twice that of the whole shrub. Naturally the degree of light, warmth and dryness of the air affects the amount of fluid given off, as well as the age and texture of the leaf. However, a calculation of the amount of fluid perspired by an acre of cabbages may be curious. If the cabbages are planted in rows of 18 inches apart and 18 inches from each other, it is estimated that in the course of 12 hours no less than 10 tons 4 cwt. 3 quarters and 11 lbs. weight of water will have been insensibly perspired by their fleshy leaves.—*Science for All.*

The Action of Light on Milk.—Direct sunlight very soon spoils milk or cream by premature souring and decomposition. The effect of indirect or reflected light has been but little observed. It nevertheless exerts an active influence, not only upon milk and cream, but upon butter and cheese while curing. The general effect of light upon cream is to hasten the action of the lactic yeast, and then the formation of alcohol, and after that to hurry up putrefaction, and these changes are occasioned by the influence of reflected light the same as direct light, only in a feebler degree. The first effect, however, of a small quantity of reflected light—a quantity that would enable one with good eyes to read ordinary print—is to heighten the color of cream during an exposure of 36 hours to 48 hours. As soon as the quantity of light allowed to fall upon milk is increased beyond the small amount named, its influence is soon manifested upon the cream, causing it to become sour and stale, lose color and flavor; and if the light is strong, its surface is soon covered with mould and pimples, when the milk standing in a shaded position will be all right. The conclusion is that too much light is often the cause of faulty butter, and even butter will fade if exposed to the light though it be in brine.

Importance of Scientific Knowledge.—A well-grounded knowledge of the great law or principle of conservation of energy should be taught with the multiplication table. It can be so taught if the teachers themselves are certain that there is in the universe only so much energy, and that we cannot make one particle more than already existed. With a clear understanding of this principle, no time will be wasted in search after perpetual motion machines, and fewer mistakes will be made by really earnest seekers after improved machines for use or improved methods. When a young man brings to me some wonderful improvement over the ordinary crank motion, some device that is to supersede the crank of the steam engine, a feeling of utter helplessness comes over me. I know not how or where to begin; he has had no opportunity to learn the simple laws of mechanics, and to point out the fallacy of his argument means to teach him the laws of mechanics, so I can only say to him. "Don't," and may advise him what books to read.—*Coleman Sellers.*

A Piano-violin.—A novel musical instrument called a piano-violin is the subject of a patent recently issued to Messrs. J. Parsons and J. W. Trinkle, of Kent, Ind. A case is provided containing two sounding boxes, one resting behind and connected to the other. To the front side of the inner sounding box is secured a bridge transversely to the box. To the front of the bridge a series of jaws are secured, between which the string bars are passed, the latter of which are provided with a spring tongue. An endless belt is made to pass by the strings in the instrument by means of a treadle, and as the keys are depressed, the corresponding strips will be drawn upward, bringing the lower end of the corresponding string bar toward the belt, which coming in contact with the string produces a vibration and sound as long as the belt is kept in contact with the string.

Experiments in Magnetism.—Among the most notable results of recent experiments in magnetism is the discovery of a peculiar property possessed by a magnetic body. The explanation in this case is that not only can the molecule be rotated through any degree of arc to its maximum or saturation, but that, while it requires a comparatively strong force to overcome its rigidity or resistance to rotation, it has a small field of its own through which it can move with excessive freedom, trembling, vibrating or rotating through a small degree with infinitely less force than would be required to rotate it permanently on either side. This property, it is said, is so marked and general that it can be observed without any special iron or apparatus.

Manufacture of Gunpowder in the Wet Way.—M. Nordenfelt has taken out a patent in France for making gunpowder as follows: The requisite quantity of sulphur is dissolved in sulphide of carbon, and this solution is then mixed with the carbon, which, instead of charcoal, as in other methods of making powder, is cotton or some other cellulose fiber, which is reduced to an impalpable powder. Finally, to this mixture is added the proper quantity of a saturated solution of saltpeter. This mixture is then evaporated and the crystallization is broken up, or it is evaporated in a vacuum. It is asserted that the process gives a more perfect incorporation of the several substances than is possible in the dry manufacture.

The Moon's Influence.—Those who yet cling to the old-time faith in the moon's influence upon the weather may be interested to learn that so eminent a scientist as Sir William Thompson has recently felt called upon to declare that careful observation with the barometer, thermometer and anemometer have failed to establish any such influence; on the contrary, that if there is any dependence of the weather upon the phases of the moon it is only in a degree so slight as to be quite imperceptible to ordinary observation. Careful observations in the same direction, made by Dr. Gibbons, of this city, and continued through a series of more than 30 years, fully confirm the statement of Sir William Thompson.

Rapid Growing of the Coral Insect.—After a cruise of a few months in the South Pacific, a French man-of-war was recently found to have specimens of living corals growing upon her hull. The interesting discovery has thrown some light on the question of the rapidity of growth of corals. The evidence tends to show that the vessel, on passing a reef of the Gambier Islands, against which she rubbed, had picked up a young fungia, which adhered to the sheathing and grew to a diameter of 9 inches and a weight of two and a half pounds in nine weeks.

Measuring the Expansion of Explosives.—Experiments with gelatine dynamite have shed a curious light on the expansion of explosives. The test is made by inclosing the compound in a cavity of lead whose walls are very thick, capable of uniform attenuation, but resist rupture until the last limit of tenuity is exhausted. By exploding thirty grammes of No. 1 gelatine dynamite in a cavity whose capacity was fifteen cubic centimeters, the space was enlarged by 1330 centimeters, nearly in the ratio of 1 to 90.

Developing Electricity.—Mr. R. A. Proctor says that electricity might be obtained by utilizing the heat of water applied to the junction of two metals; but the current produced by a temperature of 160 degrees Fahrenheit at one junction, and say 60 degrees Fahrenheit at the other, would be too small to be commercially successful.

A man has invented a coiled-spring attachment to a sewing machine, clothes wringer, etc., by which, and a crank, the old man can store up power enough before he goes to business to run the house all day. President Cleveland will avoid the necessity for this, not being a family man.

A New Link.—A German chemist has obtained a new link between the vegetable and animal kingdoms in the shape of an animal gum closely resembling the plant gums in its physical and chemical properties.

TABLE OF CONTENTS.

EDITORIALS.—The Interoceanic Ship Railway, 185. Passing Events; Develop Your Gold Claims; Treatment of Copper Ores; American Machinery for the Soudan, 188. Air Currents in Mines; Sierra County Mines; Providence District, 189.

ILLUSTRATIONS.—The Interoceanic Ship Railway—Sectional Elevation of Position and Railway Cradle, 185. Fig. 5—The Interoceanic Ship Railway—The Lifting Position and Railway Cradle, 189.

CORRESPONDENCE.—The New Gold Era; Tuolumne and Mariposa, 186.

MECHANICAL PROGRESS.—Friction; United States Machinery in England; A New Method of Melting Iron; Steel for Underground Colliery Purposes; Compositions for Cementing Iron; The Hammer in England; The Use of the Power Indicator; Strengthening Steel; To Detect Imperfections in Iron; The Strength of Shafting, 187.

SCIENTIFIC PROGRESS.—Erroneous Ideas in Regard to Snakes; Perspiration of Plants; The Action of Light on Milk; Importance of Scientific Knowledge; A Piano-violin; Experiments in Magnetism; Manufacture of Gunpowder in the Wet Way; The Moon's Influence; Rapid Growing of the Coral Insect; Measuring the Expansion of Explosives; Developing Electricity; A New Link, 187.

USEFUL INFORMATION.—Eighty Years of Usefulness; Preserving Wood; The Eyes of Insects; Simple Test for Glucose in Sugar; Artificial Mother-of-Pearl; How Wood Carving is Done; Packing Butter in France; For Cleaning Old Paint; Illuminating Paper; To Destroy the Effect of Acid on Clothes, 191.

GOOD HEALTH.—Sleeplessness; A Salt Water Bath at Home; How to Remove Dandruff; Sealskins Dangerous to Health; Silk and Wool Underclothing, 191.

MISCELLANEOUS.—Mining Laws, 186. The Miners' Appeal; Miners' Wages in Idaho, 190. Applies to Other Districts Also, 191.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 192-93.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 196.

Passing Events.

The long expected rain came at last this week, and though not as widely extended as was hoped, has done much good.

The labor strike in this city is over, and the men are all at work again, though the iron industry still continues in rather a depressed condition.

War and rumors of war in Europe form the topic of conversation among readers of dispatches. Any serious complication between the great powers generally brings money into the pockets of American merchants and farmers, and the results of the present differences are watched with interest.

A number of men are going into the northern California mines already, though they are advised hy those who know, that it is yet too soon to do any prospecting in the regions referred to.

A new commissioner of patents has been appointed hy the President, and inventors and agents are in hopes that he will he able to arrange matters at the Patent Office so that the work will he caught up with once more, and the affairs of the office he more rapidly conducted hereafter.

THE President has nominated Wm. Garrard, of Nevada, superintendent of the Carson mint, to take the place made vacant hy the death of Superintendent Crawford.

AT the Union Iron Works enough laborers have been secured to carry on the work, and the men who struck for $2 a day are out of employment.

Develop Your Gold Claims.

It is very evident from the course of events that from this on a great deal more attention than formerly will he paid to the development of gold properties. Gold mines are in demand. There are plenty of regions where silver, copper and lead are more or less abundant, hut not many where gold is found. California "has the call" on this class of properties, as it has had for years. For the past ten years or so, however, our mining capitalists have been going to a distance for claims, to the neglect of home mines. But, notwithstanding this, California has kept up its production very well, ranking second of all the States and Territories in bullion production, although the Territories count in their totals their copper and lead, while we count only our gold and silver. Since the prohihtion of hydraulic mining our gold product has somewhat fallen off, it is true, hut by no means as much as was expected. The reason for this is that men have looked more carefully after quartz interests, and have opened and developed more of that class of mines.

With the low price of lead and copper, and the heavy discount on silver, people are beginning to think more of gold claims. There is therefore now quite a demand for them. Miners who own gold prospects will therefore do well to go to work on them and try and prove them up. There will be no trouhle to dispose of such claims in the future at good prices, if they are at all promising. Time was when miners could not sell gold claims at all, hecause buyers were looking in other directions. But this is changed, and the change is to the advantage of California miners.

Throughout this State there are regions where there are many small undeveloped or partially prospected ledges which ought to he worked enough to prove at least their value. It behooves these owners to start at work on them. Instances are occurring every day which show the propriety of this, where claims have laid idle a long time and a little work has finally shown them to he of value. People from other regions are now once again looking toward California for investment, and wherever there there are mines of any fair promise at all money can be found to put them in shape to he productive.

New York Cable Railway Company.

The new commissioners appointed hy the General Term of the Supreme Court under an order of December 1, 1884, consisting of Guy R. Pelton, Chairman, William C. Traphagen and Le Roy B. Crane, who are to report whether the twenty-nine cahle railway routes designed hy the rapid transit commissioners, acting under the law of 1875, should now he constructed, lately commenced their proceedings in New York City.

There is a very vigorous opposition from the existing horse-car and elevated roads, and also from the property owners interested in the several routes. Many protests have been put in questioning the legality of the appointment of the commission, and the property owners along the first route designed, namely, from Harlem river through Lexington avenue, Grammercy Park and Irving Place, and through streets to be opened hy hreaking through property, to he condemned from Fourteenth street to the Battery, have combined to resist the project in every availahle manner.

The cahle company offer a very popular program, proposing to construct 70 miles of railroad through the city, partly elevated and partly surface, and to charge a fare of only five cents per passenger, with the privilege of transfer from one route to another.

The scheme was planned by General Veile, and the capital is supposed to he supplied hy the Standard Oil Company and the New York Steam Heating Company combined, hut the strength of the vested interests, as well as the sense of property owners along several of the lines, seem to present an insurmountable barrier to the accomplishment of this hold design.

A DISPATCH from Berlin, dated the 8th inst. says: Two hundred and seventeen miners were imprisoned hy an explosion of fire-damp in a colliery at Camphausen, near Saarhruck, in Rhenish Prussia, this morning and at a late hour this afternoon, hut seventeen had been rescued. It is feared that most of the 200 others have been suffocated.

Treatment of Copper Ores.

The ore of most frequent occurrence is copper pyrites, which is, however, usually associated with iron pyrites or with other compounds of iron or copper. In the Rocky mountains iron pyrites is seldom the preponderating mineral, although in other places it is, and therefore the surface ores are usually, in the northwest, as in Montana, rich oxysulphurets merging in some mines into purple ore; and in the southwest, as in Arizona and New Mexico, carhonates and oxides, associated with more or less oxide of iron and manganese.

These differences in the composition of ores necessarily involves a difference in treatment. If we run down in a cupola furnace a sulphuretted ore of iron or copper, carrying more or less quartz, lime and earthy matter, there will result a slag carrying all the silica, lime, alumina, and perhaps some of the iron of the sulphurets; and a matte carrying all or nearly all the sulphur, combined with the copper and most of the iron.

The results will he little hetter than would have been obtained by a careful concentration of the ore, which would have removed the light gangue from the heavy mineral. But if, hefore smelting the ore, it be thoroughly roasted there is eliminated the sulphur as sulphurous acid gas, and the iron and copper are converted into oxides. If, now, this roasted ore he put into a cupola furnace the siliceous and calcareous gangue is slagged off as before, and if enough silica he present all the iron which existed in the pyrites will he similarly disposed of, while the copper oxide will he reduced hy the action of the carhon of the fuel, and can he tapped out as metal. As Nature has, in the prominent mines of Arizona and New Mexico, oxidized the copper, and has done it in many cases most perfectly, the treatment is there simplified to a single reducing fusion in a cupola furnace, whereas the sulphuretted ores of the Atlantic coast and of Montana, and also those occurring in the Northwest, must h first oxidized artificially.

The practice of copper smelting in this country has been thus summed up by Mr. James Douglas:

On the concentrates from the native ores of Lake Superior, which are subjected to a single fusion whereby the copper is separated from associated iron, oxide and silica, preparatory to a refining operation in the same furnace.

On the carhonate ores of Arizona and New Mexico, which are worked exclusively in cupola furnaces, and which yield to a single furnace a coarse copper which is shipped East for refining.

On sulphuretted hoth at certain mines and at certain estahlishments in the East. When the ores are hasic the cupola furnace is used; when silicious the reverheratory. At some mines and at one of the coast works hoth cupolas and reverheratories are used.

SUTRO TUNNEL.—The receipts of the Sutro Tunnel Company for 1884 were $144,457, including $125,623 from royalties. This is an increase of $54,102 over the amount collected on royalties in 1883. The dishursements were $143,643, including $43,231 on mortgage interest, leaving $814 cash on hand. The old officers have been re-elected as follows: President, Charles W. Brush; Treasurer, London, Paris and American Bank; Secretary, Pelham W. Ames; General Superintendent, C. C. Thomas; Trustees, William Johns, Thomas P. Stoney, R. H. Pond, David Cahn, Charles W. Brush, Hugh Marshall, Pelham W. Ames.

A STATEMENT prepared by Louis F. Holtz, assessor of San Francisco, and attested hy Mayor Bartlett, has been laid before the New York Cahle Railway Commission, showing that the value of property on certain streets in San Francisco has been greatly increased hy the construction of cable roads, while on the horse railroad routes it has correspondingly decreased.

A CARLOAD of nickel and cohalt ore has been shipped from the Cottonwood mines, Lovelock, Nev., to England. Mr. Lovelock has made arrangements with a French company to have the mines worked steadily. A number of men are now employed on the mines, and regular shipments of ore will he made henceforth.

MARTIN V. MONTGOMERY, of Lansing, Mich., has been appointed commissioner of patents hy President Cleveland.

American Machinery for the Soudan.

Several telegraphic dispatches have lately appeared in the daily papers, stating that the English Government had contracted with some American firm for the supply of pumping machinery for the desert between Suakim and Berher, and this seems to have rather surprised the English manufacturers; so much so that through some of their representatives in the House of Commons, inquiry was made of the government for the reason for so doing, the reply heing that the American firms were more experienced in the manufacture of pumps for pipe lines, and with their facilities could complete the work in less time than the English. It seems that the English Government is intending to huild a railroad from Suakim, on the Red Sea, to Berher, on the Nile, a distance of 264 miles, and this over a desert where no water can be obtained; so the plan has been suggested of pumping water the whole distance in the same manner in which oil is pumped through the pipe lines in Pennsylvania. It is understood that Englaud is shipping a certain amount of material and machinery for the construction of the road in five-mile lots; that is, a vessel will take five miles of track with all its appurtenances and rolling stock, with tools and accommodations for such laborers and other employes as may he required, so that in the case of the loss of any one vessel any other vessel arriving, her cargo will immediately take the place of the one lost. This is a much hetter plan than shipping a part of the material hy one vessel and the rest of the material for the complete construction of that section in one or more other vessels, as in that case, if one vessel is lost, a new shipment would have to he ordered before the partially constructed section could he finished.

Henry R. Worthington, of New York, has received the contract for several pumping engines, which are of the usual duplex non-condensing type, calculated to work under a pressure of from 1,000 to 1,500 pounds per square inch, and with a capacity of from 150 to 200 gallons per minute.

The pipe for this service is to he four-inch wrought iron, and the works have offered to furnish fifteen miles per day.

If this project is carried out to its fulfillment, and there seems no doubt of it, it is the heginning of the solution of the development of one of the now greatest unknown regions in the world, and will in a great measure determine the superiority of the Christian versus the Moslem.

COAST COAL.—Just now in this market coal is demoralized and very cheap and dealers are cutting prices right and left. A private circular sums up the situation as follows: The market is heing crowded heyond its capacity, principally hy our coast productions; the ambition of the local agents here appears to he, which will dispose of the largest amount for the least profit, and they have successfully demoralized this branch of trade. Our consumption has diminished materially, hence the coal yards are taxed to their utmost capacity, so that any unsold cargoes arriving this month will have to he sacrificed for want of storage room. Another new colliery is bidding for public favor, certainly an inopportune time for profitable introduction. How long this slaughtering of prices will continue is a query; the remedy is in the hands of a few of our coast colliery agents, who must limit their output to hetter the market.

PROVIDENCE MINES.—Our representative's letter from the Providence mining district shows that there is much truth in the old adage that "Competition is the life of trade." When there is no competition there is little or no activity in any business. There is one first-class and well conducted mine, the Bonanza King, working at Providence. Adjoining this mine are prospects that look better than the King did at the start. All that is needed to have a number of bullion producing mines that would equal if not excel the Bonanza King, is capital and a similar business-like management. This district is San Bernardino's hest, and at no distant day it will take its proper place among the leading silver producing camps of the State.

THE Hanauer smelter, Utah, formerly the Morgan, has resumed operations after a suspension of nearly two months.

Air Currents in Mines.

A consideration of the subject of spontaneous combustiou iu mines iuvolves eome knowledge of facts concerniug the temperature and moisture of workings of coal mines in summer and in winter. The subject is also closely connected with falls of roof and sides. It is a fact that when blasting was not restricted in fiery and dusty mines in England, explosions were more frequent in winter than summer. On cold days dry and dusty mines are drier, and the dust more inflammable than on warm days. Some experiments recently made by one of the English Governm at mine inspectors, go to prove interesting facts. The hygrometer was placed as nearly as possible equidistant from roof, sides and floor.

The highest and lowest temperatures observed were—in summer, 88°, 62°; in winter, 84½°, 62°. The greatest and smallest amount of moisture in a cubic foot of air from the first working place to the return air was—in summer, 11.1 grains 3½; in winter, 9.55 grains 3½. The observatione showed how quickly and readily the air assumed the temperature of the surrounding strata, which was, of course, independent of surface temperature, and that the difference between the quantity of vapor in a cubic foot of air on the surface and in the returu air was greater the lower the temperature was on the surface. The colder air was the less moisture it was likely to contain, and its absorbing power for moisture, and consequently its drying power increased the hotter it became.

Several observations showed greater temperatures in unventilated placee and gohs than in the air current close by. On diverting the air current from waste in some seams the amount of vapor in the air increased after a few minutee, whilst the temperature remained pretty constant. This pointed to slow combustion in the gob. The time when workings would have reached the greatest workable depth was still remote. Air, under ordinary pressure or uncompressed, would avail little towards increasing the workable depth in extensive workings, owing to the air so readily assuming the temperature of the surrounding rock.

Sierra County Mines.

The Bald Mountain Extension Company at Forest city cleaned up this week for six days' work of 45 mcu, 120 ounces, 12 pennyweights, at $18.60 per ounce, which sold for $2,233.16. The face of the main tunnel is in soft picking bed-rock and an npraise has just been started there, for the pay gravel above promises, by the indications in sight, to be rich in gold. The new wire cable at the incline is working nicely and everything in the mine appears favorable for future succes. A private letter states that a miner just down from the Ruby says that 45 men are now employed there and the clean-up was expected to be very good.

Hon. C. W. Cross, State Senator of Nevada county, arrived at Downieville on Monday to inspect the quartz ledge that he has agreed, with others, to purchase of Jereme York, provided the developments satisfy him. The property is valuable. The mine, as heretofore stated in the PRESS, is up Slug canyon. He says there is enough quartz in sight that will pay to mill to last fully a year. It costs $1.50 to mine and $1 to mill a ton of the ore, leaving a wide margin for profit. The water is about all pumped out of the Marguerite shaft near Sierra city and the mill will be started in about two weeks, unless unexpected obstacles prevent. The miners are all fervently praying for storm, fearful if it does not come soon in the form of a bountiful snow fall, that their water season will be too brief for much profit.

NEW RIVER TRAIL.—The trail from Etna to New River, via Sawyer's Bar, Black Bear and Yocumville, just now commends itself as being the best, nearest and quickest route to reach the new El Dorado. The fact that pack trains are making regular tripe between the two terminal points, while all other trails are closed, merits the consideration of those who wish to visit the mines early.—*Yreka Union*.

FIVE DAYS' RUN from the Modoc furnace at Darwin, Inyo county, Cal., produces 72,318 pounds of bullion, valued at $10,594.96. The ore containe 36 per cent of lead, 69 ounces of silver and $12 in gold per ton.

Providence District.

(From our Traveling Correspondent).

This mining district is situated in San Bernardino county about 120 miles east of Calico; being 24 miles north of the line of the A. & P. R. R. Fenner station is the shipping point for supplies and ore. Daily communication is had by H. J. Young's stage and express line. Comparatively speaking, the district is a new ous. The mineral belt lies nearly north and south, extending a distance of nearly eight miles aloug the east slope of Providence mountain. The contact is a quartzite granite and porphyry, with lime formations between clay walls. Rich chutes and deposite of ore of quartz spar and carbonized zinc, are the principal milling ores. These ore bodies and vein matter exist with more regularity and firmness than in Calico, and depth demonstrates a concentration of the ore bodies indicating strong probabili ies of the existence of a true fissure vein.

The Mines.

The development of the mines of Providence, as yet, is not extensive, for so promising a district. The Bonanza King is the leading, and in fact the only mine in the district, the others being merely prospects, a few of which, however, already promise to rival the Bonanza King in the future. The King is now down on mineral to the depth of about 800 feet. The mine is worked through a shaft hoisting the ores by machinery. A net-work of drifts, stopes and tunnels have pierced and cross-cut the ground between the walls from the surface to the 800-foot level, exposing numerous rich deposits and stringer veins of ore more or less broken near the surface, but more concentrated and uniform at the lowest depth reached. The output of the mine is now about 25 tons per day. The ores will probably average from $50 to $100 per ton, producing from $35,000 to $50,000 bullion per month. About 100 men are employed, $3.50 being the wages paid. Board costs $8 per week, the company having the charge of the boarding-house. On the 5th of every month some $20,000 is paid out by the company for wages and supplies. Pay-day is never postponed, and no checks are used, coin currency being the legal tender used by the Bonanza King Co. in promptly and regularly paying their bills. This mine is now owned by a few eastern capitalists. Mr. Wilson Waddingham, of New York, is president; Samuel Kelley, general manager; H. C. Callagban, superintendent, and M. S. Bates, chief clerk—Messrs. Waddingham and Kelley owning the most of the mine. The PRESS representative is indebted to the above mentioned gentlemen for courtesies extended. This property being owned by individuals who seek no notoriety and who are venturing their money, and so far have reaped a golden harvest, but little as to the mine's output is reported to the public. Since the erection of the company's mill, about two years ago, some $1,500,000 in bullion has been produced.

Ore Treatment.

The Bonanza King mill, at Crow Town, a mile and a half distant from the mine, is the only mill in the district. It is a 10-stamp dry crushing process, somewhat similar to the "Boss" process, only that it is not continuous. The ores are dried after passing through the ore crusher. The batteries are supplied by self-feeders. From a car the dry crushings are started into pans, and afterwards pass through the settlers. The tailings are caught in tanks, the water drained off and pumped back in an elevated tank to be used again and again. This being advantageous on account of saving water, and the water repumped being a thorough salt solution, thereby saves much salt. The tailings are shoveled into cars and dumped from a high trussle-work near by. The mill has a capacity of twenty-four tons per day, and is in charge of Mr. E. Huhn, a thorough metallurgist, and he estimates the cost of milling the ores of the district at the company's mill to be $6.50 per ton. Wood costs $8 per cord, water being supplied from the company's springs.

Good Prospects.

On the north of the Bonanza King, the two pioneer miners of the camp, Messrs. Gorman and Dewyre, have opened up and developed quite extensively a claim quite similar in formation to the Bonanza King. The King mill has crushed some of the ores of the Bell McGilroy, this being the name of G. & D.'s mine, and returns net the owners $60 per ton. The ores average about 100 ounces. The development so far is merely surface work, only fifty feet having been made in depth.

The Cook and Thompson group join the Belle McGilroy further north. This group consists of a number of claims more or less developed, and so far as worked show up excellent. Some of the ores in stringer veins being unusually rich. Some shipments of ore from the Mineral Point mine of this group has been made to Kingman, and the returns have shown the majority to be of a high grade. All, or nearly all, of the ores of this district are free milling. Nothing lower than 100 oz. ore will pay to freight to Fenner or to a mill.

The Perseverance on the south is one of the best looking prospects on the belt. One claim lies between the Bonanza King and the Perse-

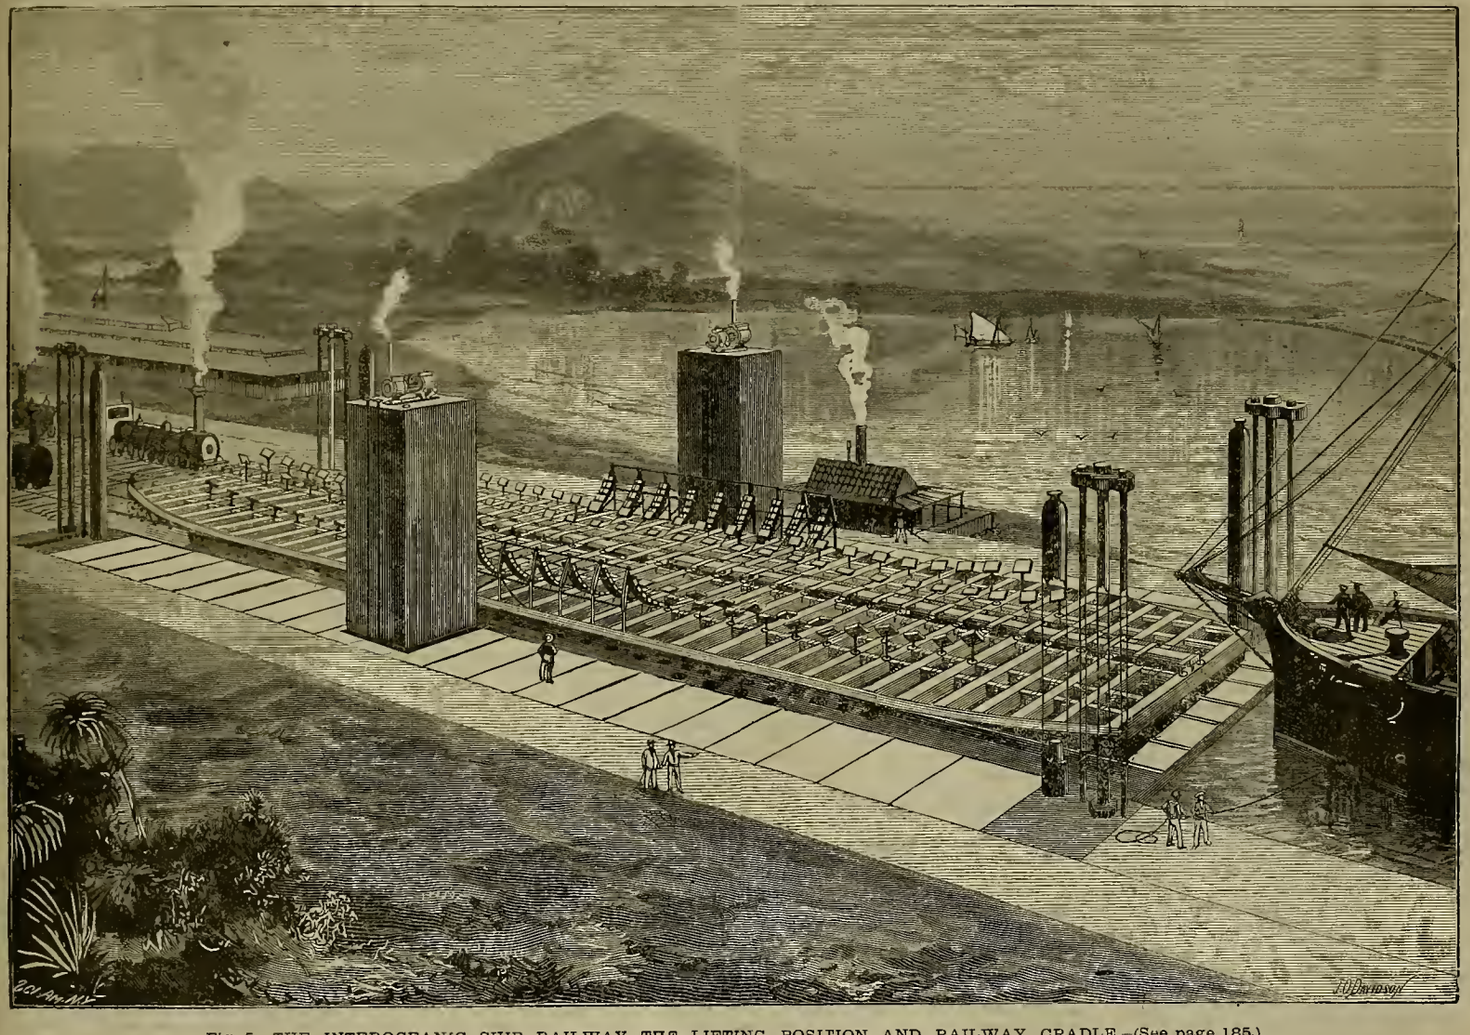

FIG. 5.—THE INTEROCEANIC SHIP RAILWAY—THE LIFTING POSITION AND RAILWAY CRADLE.—(See page 185.)

The Interoceanic Ship Railway.

(*Continued from page 185.*)

plains, the Pass of Tarifa is reached. This is the most accessible of the many passes in this depression in the mountain chain. From here the line gradually sinks to the Pacific, reaching the plaios on this side 118 miles distant from Minatitlan.

From New York to San Francisco *via* the Paoama Canal, a steamship would he compelled to pass the Isthmus of Tehuaotepec, sail south a long distance, aud after crossing sail north again the saine distance before reaching the short route to San Francisco. In other words, she would have to traverse ahout 1,200 miles more than if she had crossed the Isthmus at Tehuantepec. From Gulf ports to San Francisco and the East the difference in distance in favor of Tehuantepec is still more marked; the route between New Orleans and Sau Fraucisco *via* Tehuantepec heing about niueteen hundred (1,900) miles shorter than *via* Panama. From Liverpool to San Francisco there is a saving of 600 miles *via* Tehuantepec. With sailing vessels—and sailing vessels, much as we hear of steamers, carry fully three-quarters of the world's freights to-day, and are likely to continue to carry slow freights—the contrast is still more marked. However, sailing vessels which are floated across the Isthmus *via* Panama are left in a regiou of almost perpetual calm, and have to go hundreds of miles before reaching the trade wind regions. It would he a generous estimate to allow for only ten days'—good authorities say from 20 to 30 days'—delay hetween the Pacific side of the Panama Canal and the point where a sailing ship strikes the northeast trades, hy reason of calms and the slow progress made while in tow. Allowing that a sailing ship can average 170 statute miles in a day's run, this would add 1,700 miles to the 1,200 miles extra run required *via* Panama, and hence would serve, practically, to make the Tehuantepec route 2,900 miles shorter in the run from New York to San Francisco, and 3,500 miles shorter in the run from New Orleans to San Francisco.

Io the ship railway project a ship is lifted out of the water by means of a submerged pontoon, similar to those in use all over the world; but no such force as that used in hauling a ship up out of the water on a marine railway is required on the ship railway, although, as well known, ships are constantly taken on tbe marine railway without injury. In the Eads' system, however, therc is no necessity for using any force whatever on the ship itself.

It is lifted out of the water in a cradle which rests upon a series of rails; and these heing brought even with the tracks on the dry land, the cradle, in its capacity of a car, is whecled along an almost level railway across the Isthmus of Tehauntepec, aud when it reaches the other side a similar means is employed to float it again. This is the whole project—a combination of the lifting dock in general use, and an improvement upon the marine railway, because the ship is never, as in the latter, required to he off an even keel.

TEe eugravings which appear in this article (which will he concluded in next week's issue) will give a good idea of some of the details of the plans. The cuts originally appeared in the *Scientific American*, and we ohtained them for the PRESS from the Eads' Ship Railway Company, New York, to which we are indehted also for information additioual to that which has been before published.

The pontoon, or floating dock (see Figs. 1 to 4), is of the same general constructioo as those in use all over the world, save in some important modifications rendered necessary to fit it for its especial work. For it is not enough that the vessel should he docked and lifted out of the water, but that it shall he caused to rest upon a cradle in such a manner that its weight shall be equalized fore and aft, and thus enahle the carriage with its load to move easily and safely. This is effected by means of a system of hydraulic rams arranged along an intermediate deck about six feet helow the upper deck of the pontoon (see Fig. 2). The arrangement of the rams is in hoth lateral and longitudinal lines, the former standing a little less than seven feet apart, the one from the other. The area of the combined rams in each lateral line is the same; the area of the one ram under the keel forward or aft is equal to the area of the five or seven rams amidships. They may he connected and made to work in unison, so that the same pressure per square inch of surface of the rams will exist throughout the whole system, or they may be disconnected hy valves, so that a greater pressure may be brought upon the rams in a certain section or on a certain line. It is no part of the duty of these rams to lift the vessel.

They are designed only to resist its weight as it gradually emerges from the basin. They get their power from a hydraulic pump placed on a tower affixed to tbe side of the pontooo, and rising and sinking with it, but of such a hight that, even when the pontoon rests upon the hottom of the dock, it is not entirely submerged. The pontoon itself is directed hy powerful guides, which cause it to descend and emerge from the water always in the same position.

A ship having entered the mouth of the Coatzacoalcos River, on the Atlantic side, and come up to the basin, the carriage with its cradle is run on to the floating dock, then water is let into the compartments of the pontoon, and dock and cradle gradually sink to the bottom. Then the ship is brought in from the exterior basin, and so adjusted as to position that her keel will he immediately over the continuous keel block of the cradle, and her center of gravity over the center of the carriage. The water is then pumped out of the submerged pontoon in the mauner employed in floating dock systems, and it rises gradually, bringing the cradle up under the ship's hull (see Fig. 2). As soon as the keel block of the cradle is close to the ship's keel, the hydraulic pump is called into action, and pushes up the pendeot rods and posts of the supports gently against the vessel, closely following the lines of her hull and the run of the bilge. The pressure upon the rams increases as the vessel emerges from tbe water, but the water pressure under them heing prevented from escaping by the closing of the valves, the ship's weight, when she stands clear of the water, is borne by the rams hy means of the supports.

In the case of a ship weighing 5,000 tons, each of the 50 lines of rams would, of course, be called to sustain a hurden of exactly 100 tons; and these lines heing placed at equal distances the one from the other, it will readily he seen that each unit of the ship's weight is equally distributed. The weight and displacement of the vessel is learned from the pressure gauge on the hydraulic pump.

The vessel being clear of the water, hand wheels or adjusting nuts that move in threads cut in the columns of the supports are run down to the bearings on the girder plates, whereupon the valve is opened and tbe rams withdrawn, leaving the girders to support the weight of the ship. Now, each girder has the same number of wheels, aod as described above, hears its just proportion of weight and no more; hence, each of the multitudes of wheels under the carriage is called upon to hear the same weight. This weight has been calculated to be only from 8 to 9 tons, though the wheels will he tested to 20. One of the many ingenious contrivances in the scheme is the "hydraulic governor," so called, aud hy which the unevenness of the plane of the pontoon when it is rising or falling with its load can he readily corrected. This apparatus is thus described:

Two cylinders are attached to each corner of the dock, one heing upright and the other inverted. Plungers attached to the pontoons move in them. Thc two cylinders on diagonal corners are counected by pipes, and all spaces in the cylinders and pipes are filled solid with water. As the pontoon rises, the water forced out of one cylinder by the ascending plunger is forced into the inverted cylinder on the diagonal corner where the plunger is heing withdrawn. Now, if there is, say 100 tons preponderance on one end of the pontoon, ooe-half this weight, or 50 tons pressure, will be exerted hy each plunger on that end upon the water in its cylinder. This pressure is instantaneously transmitted through the pipes to the water in the top of the upright cylinder on the diagonal corner, which acts with the same amount of pressure as a water plunger upon the metal plunger to hold it down; thus an equilibrium is maintained, and the pontoon compelled to rise and fall perfectly level. It is possible hy aid of a pressure gauge attached to the pipes to ascertain the exact amount of the excess of weight, so that, should this gauge show too great a preponderance, the pontoon must be lowered and the ship placed in a new position.

The pontoon cannot elevate the rails on its deck above what would he a prolongation of the rails ashore, hecause of the heads of the anchor bolts or guiding rods, and these will also prevent any tipping of the pontoon when the ship-burdened cradle is moving off. The carriage with its cradle, which comes up upon the suhmerged deck, is calculated to hold a sbip even more firmly than the launching cradle used at the ship-yards, with its shores and stays. This carriage moves upon six rails, three standard gauge tracks each of four feet eight and one-half inches. Ships themselves are girders, and must of themselves he so, from steru to stern, hecause in the tempestuous seas iu which they are designed to roam, the one part is constantly heing called upon to support the other; now her how projects over a great hillow with no hing under to support it, and again she is poised upon a huge wave, leaving the midship section to support in great measure both the how and the stern, and were she not constructed as a girder fore and aft her back would he broken in the first hig seas she encountered. Comprehending this, the dcsigners of the ship-carriage make its streng h reach its maximum in the cross girders, which are spaced like the lateral lioes of the rams already described; that is to say, seven feet apart and haviug sufficient depth and naterial in their plates to insure an equal deposit of weight upon all the wheels. These latter are double-flanged and are placed close together, each heing hung independently on its own journals, and having its own axle. Under an ordinary railway car the four or six-wheel trucks move together about a center pin, hut in the ship-carriage, which is not designed to move off from an almost straight line, this is not required, and greater strength is ohtained by adhering to the rigid principle, elasticity heing had hy placiog a powerful spring over each wheel. These springs will, as said before, hear a weight of tweuty tons and have a vertical movement of about six inches, while the maximum weight they will ho called upon to hear will not depress them more than three inches, and allow for crossing irregularities without hringiog an undue weight upon the wheels.

There is also a system of supports for the vessel, each having adjustable surfaces hinged to the top of the supports hy a toggle joint, in such a way that they may he made to closely follow every depression and yield easily to every protuberance or bulging. They pierce he girders of the carriage, and are exactly pendent over the hydraulic rams when the carriage is on the pontoon and rests in its proper posi ion. Thus, as will he seen, the ship when crossing the Isthmus rests upon what might be called a cushion, and indeed she will have experienced far rougher treatment, hoth in the Atlantic and Pacific under only ordinary conditions of weather, than that had while in *transitu* hy rail across the isthmus.

In our illustrations, Fig. 1 shows an elevation of the adjusting of the screw standards for supporting the vessel on the pontoon, the details of these standards being given in Fig. 4. A is the standard, having a head plate with universal joint, its top cushioned with rubher or canvas, to prevent damage to the ship; B is an adjusting nut, which, when the rams are down, stops the descent of the jack by contact with the top side of the main girder, C, on which they will rest, D heing the top of the hydraulic jack of the pontoon, the number of these jacks used being better shown in Fig. 3, a perspective of the floating pontoon. E F G, in Fig. 2, show the sectional girders hy which the weight of the vessel is distributed on the jacks. H shows one of the upper pontoon sections. J shows an arrangement in connection with the pump on pumping tower, L, to distrihute the load of the vessel equally on all the jacks. I and K show the arrangement hy which the water is exhausted from the pontoon. On eacb side of the basin there are several rods, on top of which are nuts capahle of holding the poutoon, to prevent its rising ahove the level of the railway when the ship and cradle have heeu taken off. Fig. 5, on page 189, gives a general view of the lifting portion aud railway cradle.

(*Continued next week.*)

The Miners' Appeal.

The Miners' Association, during the last days of the session of the Legislature, presented the following petition, which, however, did no good, as the Cross hill, which was drawn to give them relief, was defeated.

To the Assembly of California:—The last hours of the sessiou of the Legislature for 1885 find the hill introduced into your honorable body to enable the miners to continue their industry legally without injury to any and benefit to all, not yet reported from the committee, and by the aid of the irrigators, defeated io the Senate; and representing, as we do, tbe miners of the State, our sense of duty impels us to make one last appeal for protection and justice at your hands. No question of more vital importance was ever presented to the Legislature of any State in the Union. We come asking for hread for the vast constituency we represent; will you give them a stone? Hear us for our cause; turn not a deaf ear to the supplications of the thousands and tens of thousands whose now happy bomes will he made desolate by non-action on your part. The day has come when the *per diem* of the members of the Lsgislature must stop; hut is there no pay except in dollars? Is not the approval of one's own conscience, the gratitude of men, the smiles of women and the happiness of innocent children sometimes worth more? As those who step somewhat outside the hounds of duty to obstruct and defeat all consideration of these hills will forever receive the condemnation of every true friend of California—so will those who now sacrifice something in the cause of justice receive at the hands of the people the ever welcome plaudit, "Well done, good and faithful servants." Will you adjourn and go to your homes without even hearing the cause of those we represent?

You know that thousands upou thousands of people went upon the bleak and arid mountain sides of the forhidding Sierra Nevadas, and into the depths of the most desolate canyons, in search of the royal metal, gold, because it could not he found elsewhere—and, under what they thought the laws of the State and of the nation, constructed enormous reservoirs to store water; built thousands of miles of canals to divert and carry this water, over the roughest portion of the State, to their mioes; they lived in flimsy huts or in caves, or in the open air, or in tents affording insufficient shelter from the hurning sun of summer and the snows and freezing blasts of winter. They were poorly clad and lived on the coarsest food, not enough, in many instances, to support life while they were digging ditches, building reservoirs, running long tunnels, turning rivers from their beds, and waited for the opening, and developing their mines—out of whicb beautiful homes have heen made and large and prospcrous local communities have been built up—our State created, and the gold furnished and distributed with a lavish hand, even to the extent of the support of our Government in its hour of trial.

These people have demonstrated that California can he made to sustain a nation.

That this way, pointed out by these miners, millions of capital was invested in mining enterprises throughout the State, and wealth in solid gold was created to the extent of 1,500 millions or more of dollars.

But now comes an interpretation of law that these facts and doings of the miners and their diversions of water and its use, are wrong and illegal—that a man who has not lived in the State for a generation, and who happens to own a few acres of land hordering upon one of these streams, has the right to have this stream run past his land undiminished in quantity and unpolluted in quality, and to preserve that right, all mining must cease—the beautiful homes must go to ruin, the prosperous communities must leave and the mining districts must he left untenanted and desolate, except by a few Chinamen. Schools and churches must be closed and the miner and his family must seek a new home.

Is this the judgment of the California Legislature? The people we represent are an intelligent, cultivated, earnest, hard-working, law-abiding people. They are non-producers of everything, except gold, that they eat or wear or consume, and as such are a desirable population for our farmers and manufacturers to find a market among. They wish to proceed by legal methods and deprecate one idea of being driven to resort to other measures to protect their property and all they hold dear.

Hundreds of suits involving the destruction of their property and the absolute ruin of thousands, have heen instituted to compel them to close their mines and shut off the life-giving water, without which they cannot he worked.

Suppose the final order comes, and the officers of the law attempt to do an act that will desolate the country? Will free-born American citizens submit to such a wrong? Would not blood miugle with the waters that flow out over and into the mines? In such a contest would not cowardice itself throw away the scabhard?

These people are willing to pay all damage lawfully awarded to any one on account of the diversion of water, or from their mining operations, hut they ask that no one shall be allowed to deprive them of the use of the water or their mines, or levy tribute on them.

Is it unreasonable that they ask you to fix some mode of procedure for determining what they shall do, how much they shall pay in doing so, to those who claim to he damaged tbrough their opsrations and their use of their water?

Is it unreasonahle that they ask you to fix some rules for distributing this cost among themselves? This is all that the bill introduced into your Honorable Assemhly and defeated in the Senate proposes to do. We ask you to bring it up and give it consideration. So great an interest as that we represent cannot and should not he ignored.

If this measure bas not heen brought forward faster, it has not been the fault of its friends; ueither has it been the fault of those whose very existeuce may depend upon your action.

We have spoken thus far in behalf of our present population; hut we add to this a prayer for the future nf California. We beg that you will not, hy non-action, destroy for years the bright future of our State.

We are credihly informed that the eyes of all the East, as well as of Europe, are upon us in this matter. and that we need not expect any immigration of honest miners to add to our population and wealth, or any investment of either home or foreign capital to develop our well-known and most valuable mineral deposits, unless you enact laws under which mining will he legally possible. Very Respectfully,

THE MINERS' ASSOCIATION.

San Francisco, March 5, 1885.

Miners' Wages in Idaho.

The trouhle hetween the miners and tbe mine owners at Broadford and vicinity, have not yet heen amicably settled, says the *Ketchum Keystone*, but no doubt will he in the course of a few days. Miners or others have the right to refuse to work at prices that don't suit them, hut they have not the right to take possession of the property of others and prevent them from employing whom they please. While we do not advocate the reduction of wages in any hranch of husioess, yet, at the same time, we think men should make the hest of the situation until they can do hetter. If they wish to work at all, it is better to work at $3.50 or even $3, than to remain idle.

Miners' wages are coming down all over the West, and before a twelvemonth has passed, $3 will be the established price for a day's work in mines of the Pacific Slope. The reduction is not made through choice. Mine owners are as much compelled to economise in times of general depression as men are in other branches of business. All mines being worked do not pay. There was never but one Comstock, one Ontario, one Horn Silver, one General Custer, one Consolidated Eureka, one Iron Silver, while there have heen, and are yet, thousands of mines with a history that do not afford a dividend, and many of these even refuse to give hack the money that has been put into them. On the n her hand, many mines, now unproductive, could be made to pay reasonable interest at $3 or $3.50 per day for labor.

The mine owner has but this alternative—make his mine yield something more than expenses or close it down. Matters of this kind should he considered in a cool, common-sense light, and not in a spirit of hatred and revenge. Men should have a hearing of dignity and a spirit of independence. If they are informed hy their employer that $4 cannot he paid any longer, hut that $3.50 can, they should, at least, quietly quit if they are bound to an association that compels them to work for no less than $4, and give others a show who are willing to work for $3.50.

Where, we ask, can the practical miner go

to-day and do better than he can in Wood River? Montana is a $3 to $3.50 country, and more men than there is employment; Nevada, once the banner mining State of the Union, is getting down to $3; Utah, Wyoming and Colorado are still worse. There are no wild-cat or snide companies in the Wood River country. Every miner gets his coin for his labor. He does not take chances on an hour's work. Besides, there is more money in labor here to-day at $3.50 than there was at $4.50 two years ago. Nearly every commodity was then double the price it is now. These things should be considered.

Further, we have been in mining regions and in mines, and with miners for a quarter of a century, and we have observed that this government is big enough and strong enough, and ever ready to protect its citizens in their property rights, and whoever undertakes to unlawfully dispossess another of his rights, and attempts to run his business for him, will get left every time, as they should.

Applies to Other Districts Also.

A correspondent of the *Quincy National*, speaking of Plumas county quartz, says:

"As a recent arrival in your county, I cannot help feeling surprised at the marked apathy displayed by your mining population in respect to that most important branch of their industry, the manipulation of quartz, as it is on that the future prosperity of this district mainly depends. For though rich gravel beds may still exist in this vicinity, the stringent laws lately enacted against hydraulic mining renders it imperative you should turn your attention to quartz, or abandon one of the most promising mining fields on this coast. One would naturally suppose, the success attending the development of the Plumas Eureks, which is evidently a mother lode and extends for a long distance in this direction, would have demonstrated that a little energy alone is required to give this district a more permanent and healthy prosperity than it ever enjoyed in those exciting days when your placer mines were in full bloom, as there is a stability and soundness attached to quartz working seldom found in placer mines, though the latter pursuit is frequently the most exciting. Now, I do not say that any fabulously rich ledges exist in this district, but fully concur with several practical mineralogists who have traversed the belt, in maintaining that the mother lode of the Plumas Eureka, with several other parallel gold bearing veins, extends through this section of the country, and could, with very little expense, be uncovered in several places between this and Johnsville, thus opening an extensive and rich mineral belt which at present lies dormant. This is a matter of importance to the whole of your community, as all must benefit in a greater or less degree by the development of your mines. As a nation the Americans are generally credited with being more energetic and enterprising than our cautious neighbors, the English, and yet I can safely affirm that in no part of Australia, New Zealand or other British gold bearing provinces, would so promising a field as this remain undeveloped. The facilities for prospecting in this district are good, and but little expense would be incurred in fitting out a party of energetic and practical miners, who could in a short time determine whether Quincy is to sink into oblivion or become the business center of an extensive and prosperous mining district.

Mining Excitement at Bishop Creek.—A discovery of quartz, bearing silver, was made on the west side of Owens River valley last week. It is about opposite Bisbop creek and was found by Freeman, the assayer, and Coats, his partner in the find. Some of the rock has been sent here for assay, and it certainly has a very lively appearance. It is white quartz, through which are numerous veins of metal looking like silver, but probably contains a quantity of antimony. The town of Bishop Creek is in a ferment of excitement. On the first receipt of the news every man who could reach the locality of the new discovery went there, leaving business and other cares to that of the women and children. The whole country in the vicinity of the find has been located, and locations are now piling on top of one another. Much of the above information is from a correspondent, and further, he says, that a mining district was being formed and an election of officers was to take place at once. The ledge has been traced for half a mile with good surface indications all the way. Nothing can be told of the depth or amount of ore, as no work has been done. The news has excited many people, besides those living in the valley, each train south bearing a number who are going to take a look at the new diggings.—*Candelaria True Fissure.*

The Commissioner of the General Land Office has transmitted to the Surveyor-General of California for delivery to the party by law entitled thereto, a patent dated February 25, 1885, for the private land claim in California, known as the Rancho Corte de Madera del Presidio, heirs of Juan Read, confirmees. This grant covers an area of 7,845.12 acres.

A fire kindled by Indians among the sage brush near Independence, Inyo county, last Thursday, swept over a large tract of country, and it was with difficulty that a number of houses and hay-stacks were saved from destruction.

Useful Information.

Eighty Years of Usefulness.

There is something encouraging to young mechanics in the fact that a distinguished member of the craft has just completed eighty years of useful life and is still busy. In effort he is a very young man, for he hopes beyond his accomplishments, and believes beyond his possibilities. This old-young man is John Ericsson, the designer of the first monitor—for so he will be remembered in this country and others. And yet he will be considered historically as an inventor of the locomotive, of caloric engine, of a screw for the driving of vessels, and possibly as the originator of a "destroyer" that may add greatly to our national defenses. Possibly his solar engine may also add to his fame; but he will be held in remembrance, by those who share his friendship, as a good man and pleasant friend.

John Ericsson was born in Sweden in 1803, his father being a mining proprietor. He was educated as a civil engineer and subsequently practiced his profession in England. There in 1857 he entered a locomotive in competition with that of George Stephenson.

In 1833 he first brought to public notice his caloric engine. In 1837 he constructed the first practicable propeller vessel, the Francis B. Ogden, and the disfavor with which this was received by the British Admiralty resulted in Captain Ericsson's departure for America in 1839. His record in America began with his first essay in war ship building, the Princeton, which was the first steamship ever built with machinery protected from shot by being placed below the water line. The story of the Monitor, which revolutionized naval architecture, is too well-known to need more than a reference. For the last few years Ericsson's time has been chiefly devoted to the perfection of submarine attack, and his torpedo boat, the Destroyer, is the result of his labors in that direction.

Preserving Wood. Creosoted wood has been found less destructible by fire than the unprepared wood. Recently a building, constructed of pine and spruce in their natural state, was burnt, and nothing was left but the sills, which were made of creosoted pine. They were charred, but they retained their form and a certain amount of strength. Another striking case was that of a derrick forty feet high with a forty-foot boom made of creosoted pine standing on an untreated pine base; the latter was burned to ashes, but the mast and boom, although charred all over, had forty-five feet of their length still good for future use. Creosoted wood can be easily extinguished with water when on fire. Wood can also be preserved from decay by exhausting the air from the pores and filling them with a gutta-percha solution. This process effectually preserves the wood from moisture, water and the action of the sun. The solution is made by mixing two thirds of gutta-percha to one-third of paraffine. This mixture is then heated to liquefy the gutta-percha, when it is readily introduced into the pores of the wood. The gutta-percha hardens the pores when it becomes cool.

The Eyes of Insects.—Many insects have a most wonderful development of eyes. In the common house-fly two small round projections may be seen at the side of the head. These little dull protuberances are not, as many suppose, the eyes. Each projection contains many thousands of eyes, disposed in rows, each one of which is capable of transmitting an impression of outward objects, and by this means the fly can see as well from behind as before, as well above as below, and is, therefore, put on its guard against an attack from any direction. The eyes of a silk-worm, as nearly as can be determined, amount to 6,236, while an ordinary drone fly has not less than 14,000, and the dragon fly puts them all in the shade by being the possessor of not less than 27,000 eyes. It has been practically demonstrated by means of the microscope that each one of these eyes is capable of receiving an independent and distinct impression.

Simple Test for Glucose in Sugar.—The simplest and best test is to place a little of it under the low power of a microscope. Magnifying forty times is quite sufficient, and less will do. Cane sugar under this power is distinctly and beautifully crystalline, and each crystal looks like rock candy. They are clear, bright and beautiful. Glucose, on the other hand, has a dull, opaque appearance, like a lump of tallow. Once seen, it will be easily known ever after.

Artificial Mother-of-Pearl.—Karl Gohmia, of Berne, after a series of experiments extending over several years, has succeeded in producing artificial mother-of-pearl, indistinguishable in every respect from the natural article. It can be moulded in any shape, produced in any color, is impervious to heat and cold, and its price will be much less than that of ordinary mother-of-pearl.

Electrotypes of Woodcuts are now advantageously made of nickel up to one millimeter thick. The advantages over copper are the hardness, toughness, non-liability to oxidation, and its proportionately low price. Although at present such nickel types cost twice as much as copper ones, they will stand ten times the number of impressions and allow the use of colors which would attack copper.

How Wood Carving is Done.—For an original wood carving the sculptor goes to work precisely the same as though he was modeling for stone. He makes his clay studies and changes them as he thinks may suit the surroundings for which they are intended, and then he makes a plaster cast of them. This cast he sends to a wood-carving shop and the carvers go to work on it. A carving machine first comes into play. This machine has a plane full of little knives, which is first placed over the cast and the knives adjusted to the various elevations of the design. Then the plane is taken to the machine, placed over the block of wood and set in motion. In an exceedingly short time the outlines and exact elevations of the cast are "roughed" out and the block is ready for the finisher.

Four hundred and fifteen new one dollar United States notes, from actual tests, are equivalent in weight to one pound avoirdupois, and the number of notes should be the same of any denomination. It is not, however, perfectly reliable, as the paper upon which the notes are printed often varies in thickness to the extent of one hundred notes in a package of one thousand.

Packing Butter in France.—In France butter is packed in bags not more than three inches in diameter for family use, nor more than two inches for restaurants. Each bag holds two pounds. When filled they are tied and packed in brine in tubs or casks which can be headed tight. The cloth used must be quite free from lint, and should be very slightly starched.

For Cleaning old Paint.—Two ounces of soda dissolved in a quart of hot water will make a ready and useful solution for cleaning old painted work preparatory to repainting. This mixture, in the above proportion, should be applied when warm, and the woodwork afterward washed with water to remove all traces of soda.

Illuminating Paper.—A German paper-trade journal says that a water-proof paper which will shine in the dark can be made of 40 parts paper stock, 10 parts phosphorescent powder, 10 parts water, one part gelatine and one part bichromate of potash.

To Destroy the Effect of Acid on Clothes.—Dampen as soon as possible, after exposure to the acid with spirits of ammonia. It will destroy the effects immediately.

The First Sewing Machine.—The first complete sewing machine was patented by Elias Howe, Jr., in 1846.

Migratory birds, when flying by night, are at an elevation of from one to four miles above the earth's surface.

Good Health.

Sleeplessness.

Sleep is a perfectly natural function. It is not a negative act, but a positive process. Herein lies the difference between real sleep and the poison-induced torpor which mimics the state of physiological rest. We ought to be able to sleep at will. Napoleon and many busy men—the late Mr. Wakley, for example—developed the power of self-induced sleep to such an extent as to be able to rest whenever and wherever they pleased, for longer or shorter periods, as the conditions admitted. We have been led to believe that Mr. Gladstone at one time possessed this faculty. If that be so, his recent insomnia must be assumed to have been the result of such intense brain worry as inhibited the control of the will; or there may, of course, be physical causes which render the apparatus of the cerebral blood-supply less manageable by the nerve centers.

In any case, it is much to be deplored that, in the study and treatment of insomnia, the profession generally does not more clearly and constantly keep in memory that what we call sleeplessness is really wakefulness, and that before it is justifiable to resort to the use of stupefying drugs the precise cause of disturbance should be clearly made out. This, of course, takes time, and involves a scientific testing of the relative excitabilities of the sense-organs, central or radial and peripheral. The discovery of the cause, however, affords ample recompense for the trouble of searching for it. With the sphygmograph and a few test appliances, such as Galton's whistle, an optometer, and other instruments, the recognition of the form and cause of sleeplessness can be made in a brief space, and then, and then only we protest, it can be scientifically—*i. e.*, physiologically—treated.—*Lancet.*

A Salt Water Bath at Home.—In order to supply the continent from seashore to center, from the metropolis to the frontier, with sea-water, it is not necessary to barrel or bottle it, nor to build a pipe-line. The most excellent way is to reduce its bulk by evaporation, and when old ocean is dry and clean, pack it away in boxes weighing from one to fifty pounds. Then send it by express or freight to its destination. All the saline properties of the sea are intact, and by adding the proper quantity of water to marine salt a bath is obtained which contains, besides salt (chloride of sodium), the sulphate and chloride of magnesia, the sulphates of lime and soda and traces of the chloride of potassium and iodine.

But while we summon modern skill and enterprise to our service we must remember that the beneficial effect of sea bathing is not a modern or an individual discovery. The salutary results of a plunge into the surf is universally recognized, and its practice instinctive where and when the atmospheric conditions admit of it. Many persons find its influence over the physical and nervous system so healthful that they consider it essential to spend a few weeks or a few days at the seashore, even at great expense or great inconvenience, for they thus hope to lay up a store of health and strength that will last for months. The record of the seaside resorts of our coasts for the past few years shows the great and growing popularity of sea bathing. Modern chemistry analyzing the properties of sea-water declare it tonic and remedial, a corrective of disease and a conservator of health.

How to Remove Dandruff.—Take a piece of gum camphor as large as a chestnut and place it in one pint of alcohol. This camphorizes the alcohol. The mixture may be perfumed to suit the taste. Wet the scalp with this daily. It will stimulate the scalp, promote the growth of the hair and in many instances prevent it from falling out. German women are noted for their luxuriant hair. Once in every two weeks they wash the head thoroughly with a quart of soft water, in which a handful of bran and a little white soap had been dissolved, then the yolk of an egg, slightly beaten, is rubbed into the roots of the hair; this is allowed to remain a few minutes, and then the hair is washed and rinsed carefully in soft water. It is then wiped and dried thoroughly, combed from the forehead and parted with the fingers. After drying apply a little pomatum, made of beef marrow boiled in a quantity of olive oil and slightly perfumed. Do this near the fire in winter or in a very warm room. Almost all curling fluids are mere impositions, but with a weak solution of isinglass a firm and lasting form may be given to the hair. This solution is inoffensive. The hair should be well brushed every day in order to keep it in perfect condition. Always use the best brushes. They are the cheapest in the end. Use the brush very rapidly and for about five minutes. A celebrated beauty said that the hair should receive 100 strokes a day, and they should be applied in three minutes' time. A good and the safest wash for the teeth is pure soft water and the finest quality of castile soap. Apply with a moderately stiff brush morning and evening. The above receipts are worthy of a trial, especially for those who desire beautiful hair.

Sealskins Dangerous to Health.—Dr. J. Solis Cohen, the eminent specialist in throat and chest diseases, said to a reporter of the *Philadelphia Record*, recently, that furs upon garments to be worn about the shoulders and neck are all of them to be avoided. The thoughtless manner in which the garments are thrown back from the shoulders and throat after the body has been unduly heated by them is the chief objection to the furs. They also prevent proper circulation, and as the body in ordinary weather can be kept sufficiently warm with other and lighter garments, the furs should be abandoned. A small fur boa which is thrown about the throat while the wearer is in the open air, and at once thrown aside upon entering the house, is considered a good thing. "The sealskin coats, however, are specially worthy of notice," said the doctor, "because they have become so common. It is entirely too heavy a wrap for this section. If used discreetly, and only in very cold weather, it is unobjectionable; but the trouble is that some of the fair owners of the pretty coats wear them in pretty much all sorts of weather, because they are both fashionable and becoming, and because many ladies can only afford the one garment and must wear it at all times. Thus it is a wrap of everyday use in a climate which does not require so heavy a garment. The result is frequent perspirations suddenly checked. This means cold, consumption, death."

Silk and Wool Underclothing.—An exchange treating upon "wool and silk clothing," says: "An essential point in respect to health, and as a preventive of disease, is to keep warm in the middle line of the front of the body, as well as to sufficiently protect the spinal column, and this we contend can most efficiently be performed by wool or silk underwear. Silk, we think, has the advantage by affording electrical conditions conducive to a strong, regular and equal circulation of the blood to the extremities, as well as to all parts of the body. Experience has demonstrated that silk underclothing will in some cases cure, and in all mitigate, the pains of rheumatism, neuralgia, and nervous diseases of many kinds, while even in febrile diseases it exerts an influence that is very beneficial in giving increased vigor to the patient. Persons wearing silk underclothing are less susceptible to climatic changes, and are more free from colds than even those wearing garments made of wool. Medical science has also shown in numerous instances that silk resists the spread of contagious diseases that are rapidly and alarmingly reproduced wherever plant fiber takes up and carries the offensive odors emanating from the sick chamber."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

INDIAN DIGGINGS.—Amador *Ledger*, March 14: Mining at this camp has been unusually active this season. The Hale and Baughman claim is being worked with a full force, and is piped with a six-inch nozzle. At the last run the owners cleaned up $3,000, and they expect to realize twice that amount as the result of the present run. The Oxby claim is in splendid gravel, with excellent prospects of a rich yield. It is running full blast. The old Francis Culling's claim is being worked by A. Ball and C. Jenkinson. Under former management the claim was worked at a loss, as they were unable to bottom it. This difficulty has been overcome, and a profitable run is looked for. John Leventon is piping a cross-cut to tap the old claim below the Lawrence ranch. He is in good pay gravel, and is sanguine of success. It is reported that the Plymouth company intend to shut off the water from this section next month, for the purpose of increasing their supply. This will be a sad blow to this region, as there are so many dependent upon these mines for a living.

BUNKER HILL.—At this mine everything is moving along satisfactorily. The 40-stamp mill is kept running to its full capacity, from the 700-foot level, with ore in sight to keep the stamps going for an indefinite period. The contract for sinking the shaft 100 feet deeper will soon be completed, when a new level at 800 feet will be opened up. The ore sent to the mill averages about $7 per ton, exclusive of sulphurets, the sulphurets paying about $60 per ton. We stated a week or two ago that the sulphuret works had closed down, and the sulphurets were being sent to the Drytown reduction works. The latter statement was incorrect. The shutting down was necessitated on account of the supply of wood being exhausted, and the impossibility of hauling at that time. No sulpburets, however, have been sent away for treatment. They are being stored until the works are in shape to start up again. Before starting again it is intended to do some necessary repairs to the oven. In this connection we may state that the Meare's process of chlorination has been abandoned, and the old Platner process readopted. The last run was by the Platner method. While the Meare's process is found to save a higher percentage of gold, the old method is found the handiest for low-grade sulphurets, and is moreover less prejudicial to health.

MISCELLANEOUS.—The Plymouth Con. paid its regular monthly dividend of 50 cents per share, aggregating $50,000 on the 5th instant. We are informed that the big tunnel at Middle Bar has encountered a considerable body of quartz, said to be five feet wide and of paying quality. The extraction of the rich metal from the Mammoth still continues.

SUTTER CREEK.—Mining interests are at a very low ebb here. At the Mahoney operations are postponed, as one of the present owners is expecting to effect a sale of part of the property.

NOTES.—Amador *Sentinel*, March 14: The St. Jullian mill is pounding away. Pay day at the Zeile yesterday. Silver dollars plentiful. The most encouraging reports continue to reach us from the Amador Queen mine. This conviction is wide cast among our citizens that the river country will in a year or so bring Jackson to the front rank of mining towns. W. G. Anderson went below yesterday morning for the purpose of getting track iron and other necessary equipments for the New York mine. We understand that this mine has a large body of ore developed, an assay of which went $39 per ton. It is the intention to put up a mill as soon as the machinery and lumber can be got on the ground, and have it running by the first of June at the latest. Recently Mr. Anderson has been doing considerable ditching for the purpose of availing himself of the water in the creek on his gravel mine. He has now five men or more at work there.

Calaveras.

A NEW MILL.—Calaveras *Chronicle*, March 14: It is reported, on good authority, that a new five-stamp quartz mill is to be erected on the Bryan Quartz mine adjoining the Boston mine. It is said that the machinery is already on the, way and is now at Ione awaiting teams to haul it to its destination. Our Angels correspondent says: The cleanup at the Becktol mine recently was quite satisfactory and encouraging. For the past 14 days the amalgamating was in charge of Thos. Lee, an intelligent and experienced miner, and former resident of Angels. Arrangements have been made to continue his services at the mine.

Del Norte.

CHANNEL FOUND.—Del Norte *Record*, March 14: We are glad to learn that our old friend John Byron, alias Nigger John, has struck another bonanza on Crage's creek. John has been striking it big on this creek for about 20 years, but until now he has somehow been unfortunate. This time he says he has found the channel. He brought in $59 taken from from the mine during a few days previous.

El Dorado.

GUNWOOD.—*Mountain-Democrat*, March 14: Quartz mining, hitherto so much neglected in this part of the county, bids fair to vindicate the judgment of the select few who have never lost faith in the value of our lode mines. The Zentgraf mine, near Wildgoose Flat, is a notable example of what can be done in quartz. Mr. Zentgraf is steadily at work developing and working his mine with the most pleasant results. A recent run of ten days with bis five-stamp mill, produced 101 and 6-20 ounces of gold. He has run the 100-foot level, from the mill, 700 feet on the lode, which averages three feet in width for the entire distance, and the quartz is of an even quality of profitable milling ore. Without the aid of capital, Mr. Zentgraf bas opened and one of the very best mining properties in the State. On the occasion of a recent visit, I found the mine and mill being steadily worked. At Pilot Hill, Mr. J. A. Mendes is steadily and quietly continuing to worked this mine on its own merits, and to-day has open up the Pilot Hill mine. The discovery of some very rich quartz has already rewarded his energy, and he has now every reasonable assurance that he will be amply justified for the considerable outlay he has incurred and the perseverance he has displayed in prospecting this mine. We need a few more men like Mr. Mendes to take hold of our very promising and sadly neglected quartz opportunities with the grand mineral resources we possess. The present inactivity in our mines, and general complaint of dull times is a sad reflection on our lack of energy.

Inyo.

BEVERIDGE.—Inyo *Independent*, March 14: Reports from Straus mine in Bevcridge are very favorable. The ledge is very strong, 4 ft wide, and opening up in a most encouraging way. The ore continues to be fully as rich as where first struck, is all free milling, gold bearing, and beyond question will pay.

A PAYING MINE.—Messrs. Alexander, Kehoe & Barnes shipped 64,335 pounds of ore from the White Hill mine to the Selby Smelting and Lead Co., S. F., from which they received the following: Net value per ton $86; deductions from gross value, 20 per cent loss for lead, and 12½ per cent loss for silver, in smelting, and $20 per ton, expense of working. This mine is in a paying condition, for the simple reason that its owners, instead of letting their picks rust while they wished for capital, went to work in earnest to develop it. There are many others which need only the same treatment to pay equally well.

Mariposa.

THE NORTH SIDE.—Cor. Mariposa *Herald*, March 13: Quartz is all the talk in this part of the county at present. Every old prospector seems to be striking it rich. The Red Cloud mine is panning out big. Several new strikes have been made above Coulterville lately, one of which, if it bolds out for 50 feet, the lucky owners will get $30,000 for, from San Francisco parties. The belt of mineral which lays southwest of Coulterville has been overlooked by all mining experts. People say there is nothing there, but it is a wrong idea. I have followed mining for a long time and have been in camps where there was always one part of the district called barren. You could not get a capitalist to go and look at it; but I have seen these parts turn out the best paying mines in the long run. Take for instance, the big gold mining belt of Bingbam canyon, Utah. It was discovered in '78, though it had been overlooked for 14 years. The best mining men in the country were constantly walking over it. The richest mine on the belt lay idle for years open to relocation, and was located by a man who thought the sulphurets gold. He was right in one sense, for they did carry enough of the filthy lucre to make him independent. He sold three months after for $80,000. The mine is now owned by a company who employ over 300 men. There is 12 mills now on the belt which extends four or five miles on that barren spot which experts pronounced no good. The old saying is, "gold is where you find it." The belt which lays southwest of Coulterville has been overlooked like the Bingham canyon belt. There has not been a thousand dollars worth of work done on any mine there with the exception of Jo. Barrett's mine. A mine where $100,000 was taken out lays idle because so called mining experts don't like the belt. There is the Mignonette mine, worked by Barrett in early days which paid well after hauling the rock 14 miles. It is now owned by John Burns who has worked it for over two years and has made it pay, though he only has an arastra. He has more than 150 tons of quartz on the dump waiting for milling facilities, but what can a poor man do in California? If the mine was in Idaho or Montana it would sell for $50,000 cash down. The Rhin and Baxter mine is the same kind, at present idle for the want of capital. Thus is several other locations which will prove valuable in the near future or I am greatly mistaken. Baxter, one of the owners of the last named mine, took out considerable gold in Mineral Basin, where M. Murray has got several good locations, so you see there is a chance for a boom here soon. All this part wants is capital to make it a paying district.

Modoc.

NEW MACHINERY.—Greenville *Bulletin*, March 11: Messrs. Bidwell & Watson of the Iron Works, are engaged in building a "rubbing" machine ordered by Messrs. Knight & Roseberry of Adin, Modoc county, for their quartz mill at Hayden Hill. This machine has been found to greatly assist the process of amalgamating, a large number of them having been built here for the mills of the Green Mountain Co. and other mines of the district. Their action is to rub and brighten any flakes of rusty gold that may occur, and which would not otherwise be acted upon by the quicksilver.

Mono.

BETTER THAN WISHING.—Inyo *Independent*, March 10: Some miners are always wishing for capitalists to come along and help them develop their mines. Wishing don't develop anything. The miners at Sweetwater, Mono county, do better; one who has been up there says there are about 20 miners in the camp, all working for themselves and making more than wages. The ledges bave about the same dip as those on the Comstock, but carry very little gold. The ore is free milling, and averages $85 per ton in silver. It is packed 8 miles to the mill on mules. There is plenty of wood and water close by, and the miners will soon be able to put up a mill of their own convenient to the camp, which will greatly reduce the cost of milling.

Nevada.

WASHINGTON DISTRICT.—*Transcript*, March 14: All reports from Washington mining district continue to be uniformly encouraging. The continuance of fine weather permits developments to be pushed ahead in all directions, and a big year's work will be done. The ledge at the Yuba is being sunk and drifted on and is daily increasing in size and growing richer as a depth is reached. Ten more stamps will be added to the mill immediately, and it will doubtless be found necessary to make a still further enlargement of the capacity for crushing before the summer is over, as an immense body of fine ore is being uncovered. Mr. Webber, one of the principal stockholders in this property, is interested in other well developed claims in the same vicinity, and the extensive working of them will be begun this season. Good ore is being taken out and in large quantities by the Cornucopia and Secret Treasure Company. The Eagle Bird continues to improve, which is saying a great deal, for old miners who are well acquainted with it regard it as one of the greatest mines in that district, which is equivalent to remarking that there is not a better one in the State for the amount of capital and labor expended on it. Towle Bros. & Co. are rapidly pushing work in extending their lumbering railroad to the summit of the divide near the town of Omega, which will bring the western terminus of it close to Washington district and give direct rail communication with the Central Pacific railroad.

RICH ORE.—The ledge which passes through J. J. Meacbam's houseyard on Piety Hill has been prospected a distance of some 300 feet by several shafts sunk a depth of 30 to 40 feet, and although it is not very thick quite rich ore has been found to exist in various portions of it. Mr. Meacham showed the reporter some specimens Thursday that would yield at the rate of several hundred dollars per ton. The last crushing extracted paid a little over $15 a ton. The chances are good for a permanent and valuable mine being opened there.

Plumas.

GENESEE MINE.—Greenville *Bulletin*, March 11: Arrangements will probably be made early this season to place machinery on this property with which to sink a shaft and further prospect the mine. From the record of its present workings, there is no doubt that this new development will add greatly to its value. It is also probable that the mill will be thoroughly overhauled and repaired, and put in readiness to make the summer's run on the large reserves of ore now exposed.

GREEN MOUNTAIN.—The splendid 60-stamp mill of this company has been running steadily ever since the thorough cleaning, some months ago, of the ditch supplying water for power. The excellent equipment of the property and the general substantial appearance of its surroundings, are worthy of note. Within the mine the work is being pushed with accustomed vigor and the developments, as well as the results from the ore at present being milled, we judge to be very satisfactory. The cheapness with which the ore can be worked, their present great depth below all former workings, and the large amount of yet unexplored ground beyond, point to a brilliant and permanent future for the mine, and the success of the developments already made, marks a new era in the mining industry of the vicinity.

A GOOD STARTER.—The first Reno bound train of the N. & C. R. R. on Monday, brought in $60,000 in bullion from the famous Plumas Eureka mine, Plumas county, Cal.—Reno *Gazette*, March 4th. This is from a mine that a year ago was beginning to be considered pretty well worked out. It is now coming to the front again, and from recent developments is producing better than at any time in its history, and with more encouraging prospects than ever before for future permanency. What has already been accomplished in our own district in the way of deep mining, has demonstrated the permanency of our ore bodies and the day is not far distant when other deep tunnels will be run in our surrounding mountains. We have got the ore in abundance and have proved that it pays to make a substantial outlay to get at it, and the men of capital should be encouraged to take the same view.

DUTCH HILL.—Considerable activity is being manifested in the gravel interests of this locality, and during the coming season there will probably be quite a large number of men employed there and the mines worked on a more extensive scale than for several years past. Very encouraging reports are received from the mine belonging to Baptisto Piazzoni. From a crushing of about three tons of ore—taken without any special selection as to the quality and made with the small Cameron crusher in use at the mine—we learn that nearly $50 was cleaned up. Some parts of the crusher have been sent to the foundry for repairs, but the crushing will be resumed as soon as possible, and a mill placed upon the property as soon as justified.

ANO MINE.—Supt. Standart now has 15 stamps of the Kettle mill fitted up and running on ore from this mine. He is pushing the management with an energy which certainly deserves success, and from what we learn, the results justify their expectations. The Kettle mill bas lain idle for a long time, and being one of the finest mills in the district, it is encouraging to once more see it running. A characteristic and noteworthy feature of the opening of the Ano mine and getting it onto a producing basis, has been the absence of all excitement and "blow" and exaggerated reports. Quietly, but within a comparatively short time, the mine has been equipped, a mill put in order, teams set to work hauling ore, and the property now takes its place among the producing mines of the district.

San Bernardino.

CALICO DISTRICT.—*Print*, March 15: The Burning Moscow is being surveyed. Last week work was resumed on the Josephine. Operations are still in progress in the King mine. A. G. Rhodes continues to develop the Lone Star with good results and chloriders are also doing well. E. Burch & Co. have shipped several carloads of ore from the Blackfoot, a portion of which was taken to the Waterman mill, the returns being more satisfactory than that obtained from other reduction works. A few days will be consumed before the work of putting in five more stamps in the Barber mill is completed. A large quantity of ore is on hand ready for milling. There are about 20 men employed on the Garfield, Occidental, Mammoth and Oriental groups of mines. The Snow Bird is still looking well and may yet develop into a deep-working mine. The Sue is progressing with the usual force of men, and new strikes are frequently being made. Another tunnel is to be run in from the southeast side of the hill. Considerable sinking is being done on the Bismarck, and ore is taken from a depth of about 100 ft. A force of 24 men are at work. The usual force of men are at work on the Cuba and considerable prospecting is being done with favorable results. The surface deposits of ore are not yet exhausted. Sinking is progressing in the most favorable points, and the prospect as they go down is encouraging. Work is still progressing on the Silver Odessa mine with the usual force of men, and from 5 to 10 tons of good ore are taken out daily. Ore is still taken out from numerous points in the mine, and all ore under $100 is left on the dumps for future manipulation. The ore is still found in bunches and pockets, some of which are quite rich.

Shasta.

FRENCH GULCH.—Trinity *Journal*, March 6: A visit to this old Shasta mining town shows all bustle and activity. The town is crowded with prospectors and laborers, and traders say their business is better than any time since 1870. The principal work in the district is being done at the Niagara mine which has been producing about $16,000 per month during the past year with a 12-ton cannon-ball mill. Their new 10-stamp mill is nearly ready for work and will be started up soon. Tom Green has put in a new improved 6-ton cannon-ball and Ira Barnes, the chief engineer, informed us that he had no trouble in grinding 5 tons every 24 hours. It is run with a donkey-engine, and has produced about $20,000 the past year. The Brunswick cannon-ball, on Yankee Gulch, is in operation, run by water, and crushes an average of about 4 tons per day. A rich find is reported on the ridge about one-half mile east of the Brunswick location. The latter company is doing nothing in the mine at present, but expect to resume prospecting as soon as the ore remained on the dump—about 100 tons—is crushed. Several new strikes have of late been made in the district and some of the older mines, notably the Highland, will be opened up again and worked with renewed vigor. The outlook is very bright in that section.

PLACERS AND QUARTZ.—Shasta *Democrat*, Mar. 14: We are informed that W. H. Hall has his new mill at Copper City in successful operation. It is expected that mining capitalists will soon become interested in mining property at French Gulch and Whiskytown. Frank Thompson and John Q. Finch bave struck it rich in gold quartz up the river about six miles. Ore samples of decomposed matter and iron oxides pan out big in free gold. The placer miners in the Buckeye district are just now experiencing no little trouble in getting enough water to clean-up. Several have been compelled to wait for more rain. The Pioneer Company, which set men to work sinking on the Pioneer silver mine on Oregon gulch, last Saturday, at a depth of fifteen feet, struck ore which resembles very much that of the Silver King. Tom Green a few days ago struck another rich quartz ledge in the Deadwood district. He picked up a $200 specimen on the find, and three days afterward refused $10,000 for the claim. Bob Campbell returned last Sunday from a short visit to the new gold mines on Squaw creek. Bob says the district is alive with prospectors and all those who hold claims think they have each a fortune in hand. Lowrey & Brincard a few days ago commenced sinking a shaft on the Silver Queen, the first extension north of the Silver King. At a depth of ten feet they struck pay ore. This makes six prospecting shafts now being sunk in this district for silver, all of which we are told show up good prospects. Fred Grotefend, in company with a couple of miners, late-comers, are at work developing a silver lead the two prospectors discovered on Pete Shearer's land about two weeks ago. We have seen samples of the ore that show brittle silver, some of which assays 150 ounces per ton. N. J. Pehrson, who is sinking for a half interest on Charley Parker's claim near the Silver King, has excellent prospects of developing a fine piece of mining property. Saturday the shaft was down about 20 feet. At the bottom of the shaft the vein is about five feet wide, between fine permanent walls, and the ore compares favorably with the Silver King, which is proving so good. Ellis and Mike Shay of the celebrated Windy Camp mines have been in town for the past few days. They have been for a long time slowly developing the mineral wealth of Windy Camp and are sure to be adequately rewarded for their faith and perseverance. Another discovery of rich gold bearing quartz was made several days ago in the Squaw creek belt, by two prospectors from Redding. Samples of the quartz left at this office prospect equally as well as that from Jack Coonant's claim which recently caused such excitement. The last discovery is high up on a large mountain and three claims have been located. Tucker & Keifer, who are sinking on the Monarch for an interest, have a shaft down about ten feet. At this depth they have very encouraging prospects, the ore not only showing strong indications of silver, but prospects well in gold. The Pioneer Mining Company, composed of five Reddingites, have let a contract to sink a shaft 30 feet in depth on the Pioneer silver mine, the second extension south of the Silver King, and the shaft is now down about 12 feet, the prospect so far being encouraging and satisfactory. S. Hull, proprietor of the Silver Star, the first extension south of the Silver King, also has men at work sinking a shaft with good prospects so far. Indeed, it now looks as if several rich silver mines will be proved to exist on this vein during the summer. That the Silver King is an established mine, there is no question, for Dale & Fife have already in sight $150,000 worth of high grade ore.

SUNNY HILL.—Cor. *Enterprise*, March 14: In this district we find everything booming. The Day & Patton mill is now running at full blast and doing admirable work. The mill which is the Huntington Pulverizer patent, is simple and easy of construction, and is just the thing needed in our vast gold-bearing quartz fields in this part of the State. Messrs. Day & Patton have about 15 men at work—running night and day. They have just completed a first-class assay office and the miners of this region have now golden opportunity of having all their "mysterious" finds assayed at little or no expense. The coming summer will witness a lively time in this portion of Shasta county. Prospecting is rapidly going on and several new finds might be reported. Mr. Spencer will shortly have a fine new mill in operation on his rich and extensive ledge. Signs of improvement are visable on every hand in this section, and everyone appears to be in good spirits and full of bope. Bullychoop in a very short time will be heard from and we may reasonably expect more from that mining field than this immediate section. A few of our miners will go to New River, but not many.

Sierra.

SPECIMENS.—*Mountain-Messenger*, March 14: Some of the richest quartz specimens we have ever seen, were shown us a few days since as coming from the ledge of Gardner & Co., near Poker Flat. One piece was pyrites and gold in about equal proportions. Another was rich in gold with very few sulphurets. York & Johns have put the arastra in Slug canyon in order, and are busy crushing rock from their extension of the Slug canyon ledge. They have developed some very rich quartz, and will have no trouble in keeping the machine supplied as long as water lasts.

Siskiyou.

PICK AND PAN.—Yreka *Union*, March 14: About

No new mining locations have been made in this county within the past three weeks. Mr. J. L. Hipes has claimed for mining purposes a parcel of land on Indian creek, known as the Slide, containing twelve acres. Antone George Simas has located an excellent appearing gold-bearing ledge in the Oro Fino district, where such leads abound. H. A. Morse, Arthur Magee, Haze Hazlitt and Evan Davis have located 20 acres of placer ground in the Cottonwood district, Messrs. George G. Brown and Thomas H. George have located 20 acres of valuable placer ground in the south fork of Salmon river, near to and including the settlement of Brownsville. It is to be known as the Banner mine. Mr. James Donaldson has been placed in charge of the Black Bear mine and property, vice James Gould, resigned. It is given out that operations will commence the middle of next month, but all depends upon the arrival of Lieutenant-Governor Daggett, who may be detained longer than expected. Water is very scarce on Indian creek, and but little work on the mines is being done. The outlook for that district is not at all promising for this season, which is to be very much regretted. Many excellent mines are located in that section; among the number the famous Bonanza, owned by Brown, Bailey, & Bolds, and which created such intense excitement among mining men when first discovered. The owners are well in on the ledge, and are taking out the richest kind ore, gold being fairly matted in some of it. But few are aware that the richest kind of lead mines exist on Boulder creek, near Callahan, Siskiyou county. One mine in particular, we remember having visited a few years ago, will, in time, prove a fortune to its owner. Huge chunks of almost pure lead were to be found at the entrance of the tunnel. We found it difficult to lift a piece of the ore as large as a man's head, which will give an idea of its richness. The discoveries were never worked, as lead commanded such low figures in the market that it would not justify the shipment below on freight wagons, the rates of transportation being too high. When cheaper transportation is afforded by the completion of the C. & O. railroad through the county we expect to class lead among our exports. While the New River mines are occupying our attention we should not lose sight of the rich and important discoveries that have recently been made in this county. For instance, there are the three distinct ledges that were found on the Deadwood divide, a few miles from Yreka, by the Schroder boys last fall. In richness they eclipse anything that has yet been unearthed in the New River district. Soon after they were unearthed the owners could pick up a bucketful of the decomposed rock from any of the ledges and realize, by panning, $25 to the bucket. The prospect was so bright that they at once erected an arastra, whipsawing every foot of lumber used in its construction, on account of the country being so rough and broken, that it was impossible at that time to get lumber to the mines. Their success this winter has been beyond their brightest expectations, having taken out between $8,000 and $10,000, simply by panning decomposed quartz. In addition to this they have taken out many tons of rock which will keep their arastra going for several months, now that an abundance of water is at hand. The unexplored country will soon be visited by a horde of prospectors, bent upon giving the section a thorough investigation before leaving it. It is one of the most inviting fields we know of for exploration, New River not excepted. The weather at present is admissible of the prospecting, very little snow lying on the divide.

Trinity.

DEADWOOD.—We passed through this rich and flourishing quartz mining district last Monday in company with Dr. S. L. Blake, on our way to French Gulch. At the Gibson arastras, Mr. Alex. McGregor was found industriously grinding away with both arastras—one running rock from the Black Bear mine and the other Enterprise ore. The rock in the ore-house, from both mines, looked well. At the Brown Bear mill we found Supt. Watt, and his crew cleaning-up after the regular ten days run, and were informed that the mine looked well and the clean-ups were satisfactory. They are working about 25 men, all of whom do full justice three times a day to the substantial bill of fare provided by Ike Diener at the boarding-house. Jud. and Walter Van Matre are running the reduction works, being at present engaged on a lot of sulphurets from the McDonald mill. Ramm & Kane, lessees of the Diener mine, are taking out some splendid rock and have a good ore body in sight. The McDonald mill has not yet been started up this Spring but will soon be set in motion. The company have a large force at work sinking a shaft on the Barted mine and preparing for the erection of hoisting works. On the return trip Tuesday we met Rube Carmer and Preach Ten Eycke going in with the machinery. George Klein has stopped running his cannon-ball mill temporarily, owing to the scarcity of water. It does good work, grinding four tons per day. The Davidson cannon-ball, at the Vermont mine, is also idle, from a lack of rock, but the work of prospecting in the mine goes on. From other mines good reports were heard, the district now having a permanent reputation.

NEW RIVER.—Cor. Trinity *Journal*, March 14: Our lodes are not very large; some are rich; only a few are developed. Men without money and hunting work are coming to the wrong shop. The mountains around us are not half explored, and I believe there are better mines to be found than have been found. A few sales have been made. G. V. Hely sold the Ridgeway for $10,000. G. Gutzen bonded the Golden Gate for $11,000—got $1,000 down. W. W. Webb who held the bond, rebonded it to a San Francisco company for $20,000, so it is reported. Lots of sales have been made from $20 to $1,000. Mary Blane and Uncle Sam are incorporated and I believe the stock sells well. The Mountain Boomer has taken out several thousand dollars. The Hard Tack has made a good clean-up; Frank Ladd deserves it. There is no doubt the Tough Nut will pay well; Tom Baker is a rustler. C. Huff, Superintendent, and Mr. De Forrest, assayer of the Uncle Sam, need no eulogy; if the gold is there they will have it. Smith Brooks has gone to Eureka and when he gets back the Mary Blane will start up. Brown & Kirby are rigging up their placer mine on Slide creek. The Ridgeway Company are running the Mountain Boomer arastra and expect a ripping clean-up.

N. S. Wescott, U. S. Deputy Surveyor, and Jas. Crossman arrived this week. John Chapman, of Eureka, is here and well pleased with the mines. John Livingston, part owner in the Ridgeway, and Miles Finlan are also there.

E. A. Yocom & Co.'s saw-mill is in full blast. White Rock City is improving. Alex Cœur & Co. are building a large store. Fred. Radellinger and D. S. Stotts are putting up a saloon 40x40. The snow is nearly all gone. No trouble for pack-trains to come from Weaverville or Scott Valley if the trails were fixed a little. C. Baird and Peter's train are expected every day from Scott Valley; freight 3 cents—in summer less. I don't see the need of recommending one trail as better than another; the cheapest way provisions can be brought in and the quickest way passengers can come, will be the roads patronized.

TO NEW RIVER.—Every few days prospectors reach Weaverville and continue on their journey to the New River mines going by way of Rattlesnake. As this has been an unexceptionably open and pleasant Winter, there has been no difficulty whatever in getting through by this route. It is possible that the weather will continue through the Spring months, but more likely that before March ends we shall have a big storm with considerable snow on the mountains. In such event it will not be easy to reach New River from any direction, and those attempting it will have abundant reason for wishing that they had deferred the journey until later in the season. It is well remembered that in years past from 4 to 6 feet of snow has fallen on Trinity mountain in March, and the long continued dry spell which we have had during January and February gives rise to the hope and belief that abundant storm is yet in store, and late Spring rains and snow may be reasonably expected. To those contemplating a visit to New River the advice is given to wait until the middle of April or first of May before making a start.

Tuolumne.

ROCK.—*Union Democrat*, March 14: They are taking out rock from a very rich chute in the Chrysoline mine at Jamestown, and reports say there is plenty more in sight. Messrs. Reed and Richards unearthed a $3,000 pocket at Groveland the fore part of this week, and have a good prospect left. John Morris and Mike Page took a $1,200 pocket out of the old Paul Bauli claim on Bald Mountain Tuesday. Lang and Shaw have completed their new mill on the Kanaka mine near Groveland. The mine is said to be looking well indeed, and we may look for healthy bullion shipments from there shortly. The Lamphire mill has been running steadily for some time, but no cleanups have been made as yet. The mine is reported to present a very favorable appearance, and the ore extracted is of very good quality. The tunnel through Horseshoe Bend at Robinson's Ferry is now in over 400 feet, and is being driven ahead steadily. The Marryatt mine was cleared of water Wednesday. Work in developing the mine will commence next week.

POCKET.—Tuolumne *Independent*, March, 14: Quite a respectable pocket was struck last week, by Messrs. T. R. Reid, C. H. Richards and a Mr. Tarwater, in what was formerly known as the "Blue Lizard Vein," situated on the divide between Groveland and Big Oak Flat. The lowest estimate of the amount, made by parties who saw the gold, is $1,500, and some place it at $3,000.

MESSRS. E. J. RICHARDS, Thomas Richards and J. Pereira, will shortly open an old mine, of former bonanza fame, on Bald Mountain, with the hope of unearthing the remains of the unexcavated treasure.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, March 13: Work is being pushed at the above mine, and the managers intend to find an ore body if there is one to be found. On the 2900 level the north drift has been advanced 35 ft during the past week. On the 3000 they are driving a north lateral, just skimming the ledge, and are in a fine, heavy formation. They will crosscut after advancing further.

OPHIR.—On the 500 level have been engaged in cutting a drain and timbering. The drift which is being run north from the west drift on this level is a joint Mexican and Union Consolidated drift.

OVERMAN.—Two shifts have been put to work in the Overman mine. The old Lambert tunnel has been cleaned out, and will be driven in to strike the croppings on a level with the railroad track.

CROWN POINT AND BELCHER.—At the Belcher and Crown Point the usual amount of low-grade ore is being extracted from the old upper levels and sent to the Carson river mills.

C. AND C. SHAFT.—Ore is being extracted from the 1200 level under the Jones contract, and is shipped to the Eureka mill.

SAVAGE.—Nothing of importance is being done in the Savage, but they are waiting for the result in Norcross.

GOULD AND CURRY.—The usual work is being done, but nothing of importance has occurred during the week.

CHOLLAR.—They are running a drift in west on the 2800 level, and are in good looking ground.

SIERRA NEVADA.—Work of repairing machinery, etc., is progressing favorably.

BEST AND BELCHER.—They are pushing forward the north drift on the 1000 level.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, March 14: The west drift on the sixth level is now in 169 ft. The south crosscut has been stopped, after reaching a length of 50 ft, and a north crosscut has been started 160 ft from the incline. The west drift on the fifth level shows a little low grade ore, while the stope above this drift is giving some $50. The intermediate stope, between the fourth and fifth levels and near winze No. 2, is yielding some $50 ore from a bunch that looks promising. The intermediate stope, between the third and fourth levels and east of the shaft, is producing some $100 from a narrow ledge. There are two stopes above the west drift on the fifth level, both of which are yielding some $70 ore. The stope west of the shaft, between the second and third levels, is not looking so well. The second level is giving a little $80 ore from three small stopes. The workings above the second level show about the same. A bullion shipment of $11,866.91 was made on the 8th instant. This was the final shipment on February account, the total amount being $38,690.72 assay value.

Mount Cory District.

CORYVILLE CROPPINGS.—Walker Lake *Bulletin*, March 14: The North Star continues to show rich ore. Henry Taylor expects to strike the ledge with his tunnel in about 30 ft. The Mount Cory continues to improve and everything is going smoothly. A fine ledge of porphyry and quartz has been struck in the Snow Bird. It assays well. Henry Livingston is working the Silver Brick tunnel, which is a promising property. Prospecting is still carried on vigorously. Al. and Lew Finney, and Chris. Anderson have made several locations.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, March 13: Drift north, on the 150-ft level, was extended 24 ft the past week. The same formation continues.

INDEPENDENCE.—South drift, 400-ft level, has been extended 14 ft; total length, 1091 ft.

BELLE ISLE.—Some good ore is being extracted from the west vein above the 250 ft level.

NAVAJO.—During the past week, have driven 45 ft on the 650-ft level, making the extreme length of the crosscut east 372 ft, and the drift south 51 ft. Winze on the 350-ft level has gained a depth of 85½ ft; progress the last week, 18½ ft. South drift, on the east lateral vein, has been extended 4 ft, showing an improvement. No material change to note at any point.

ARIZONA.

VULTURE TAILINGS.—*Sunshine and Silver*, March 14: Lyman Elmore, a New York lawyer, formerly superintendent of the Mount View Mining Co. at Pinal, came to the Territory a few weeks ago as attorney for the Vulture mining company, in which corporation he is now, a large owner. He is again at the Vulture and proposes to work the tailings of that mine by a new chlorination process, of which he is said to be the originator.

MOHAVE CAMPS.—Mohave *Miner*, March 15: Frank Hamilton and the Oliver Bros. have about completed a 250-foot tunnel on the Mariposa mine at Wallapai mountain. The tunnel has been run on the ledge and considerable low-grade ore has been extracted in running it. Messrs. Ewing and Goshorn of the Altata mine have received returns from their last carload of ore, which was sent to Pueblo about three weeks ago. The car contained just ten tons and five pounds, which assayed 78 ounces in silver to the ton with 17 4-10 per cent copper. Another carload of this ore is already on the way to Kingman. Jack White and Dave Parkes are running a tunnel on the Tiger mine, in Maynard district, which is an extension of the well-known Antelope mine. They have just tapped a 65-foot shaft. Messrs. Woods and Tyrrell are taking out some good paying ore from their claims near the old sawmill at Wallapai mountain. The shipment of ore from the Infallible mine at Stockton hill for the month of February amounted to 85 tons, which was sold to the Kingman sampling works, and sampled 53 ounces in silver and 30 per cent lead to the ton. The shipment for this month will be much larger. We learn from Mr. John Barry, who has just arrived from Prescott, that mining matters are at a standstill in Yavapai county. Contrast this with the fact that we are now shipping from 300 to 400 tons of ore per month from Kingman alone and this is our dullest season here. The Hackberry mill has stopped running on tailings and will shortly work up a lot of custom ore which has accumulated at the mill. Supervisor Raymond has a couple of men at work on the Hibernia mine in Cedar district. They recently sent up a small lot of ore, weighing 1,800 pounds, which netted $430 at the sampling works. Mr. Raymond will leave for the mine in a few days for the purpose of shipping up about 100 tons of ore which is now on the dump, and which he says will assay 100 ounces silver to the ton and 60 per cent lead. The ore has to be packed 13 miles from the mine to the wagon road.

CLEANUP.—Arizona *Miner*, March 14: A cleanup, valued at $1,108, was yesterday made at the Lynx creek placers owned by Governor Tritle and Frank and Oakes Murphy, after a run of 55 hours. This is but a fair example of the richness of the placer claims of northern Arizona and but a slight indication of what wealth could be wrung from their bosoms were a sufficient supply of water always available.

IDAHO.

CŒUR D'ALENE.—Jacksonville *Times*, March 11: H. King and A. L. Rigger passed through here this week, en route to California from the Cœur d'Alene mines. They expect to return to the latter section the forepart of the coming summer, before which time very little work can be done. Both of these gentlemen speak favorably of that camp, and say that the mines are gradually getting better. A large amount of gold was taken out there last season, which will increase as fast as these diggings are opened, there being no doubt of their richness. There is a great deal of snow on the ground at present, which will not begin to disappear before several weeks.

THE BLACKHORSE MINING COMPANY.—Ketchum *Keystone*, March 12: The owners of the Blackhorse mining property, 16 miles up Warm Springs creek from Ketchum, are making preparations to work it on an extensive scale this season. The mine is situated on Boyle Mountain, near the Ontario group, and was among the first discoveries of this district. The Blackhorse has yielded much ore for several years past, and there is a fine showing of mineral in the mine now. On Wednesday evening, Messrs. Jack Delaney, Dan Martin, Jim McKarrick and Leo Gottlieb went up to the mine to ascertain the condition of the road, depth of snow, etc. Delaney, McKarrick and Martin remained at the mine. It is believed that horses can get that far up Warm Springs creek by the middle of March, if the present favorable weather continues.

VIENNA NOTES.—Everything is moving along smoothly in the Vienna and Sawtooth districts. James Moore has 8 men at work on his new mine on South Boise, a couple of miles from Vienna mine. The ore is very rich. Castro & White have made a good strike on the Elcy claim, near the Nellie. There appears to be a considerable ledge of the ore, carrying ruby and sulphurets, some of which assays 250 to 400 ounces silver. The Solace is looking remarkably well, and seems to hold its own as to strength and wealth. The Vienna mill will be running again in a few days. The mine has nearly its full quota of men. All who have gone up there to work on the $3.50 level have found employment. The outlook for the Vienna camp is bright, and those who are conversant with the development of the different mines in Vienna and vicinity, believe that the Vienna camp will be one of the most permanent and one of the best in the Territory.

THE STAR MINE.—Wood River *Times*, March 11: The Star mine, in Star gulch, is showing up well, the ore recently struck improving as drifted upon. The force at work is now taking out more than enough to pay expenses—something which has not been done for years in that mine.

MONTANA.

BLUE BIRD.—Butte *Miner*, March 11: In the shaft of the Blue Bird a body of free milling ore has been encountered and cross-cut, so far, 14 feet and the south or hanging wall not yet encountered. Sinking is still going on. On the dump of both shafts, 4,000 tons of good ore is now piled up and about 600 tons lays upon the tunnel dump. It is hard to tell what Mr. Fleming, a half owner and present superintendent of the Blue Bird will do, but it is surmised he will erect a mill during the coming season.

THE MARIA.—Joe Dafft and his partners in the lease of this valuable mine have just struck a body of 300-ounce ore. Since our last report the lessees have sunk about 50 feet and cross-cut north about 20 or 30 feet where they encountered the rich body of pink manganese and brittle silver ore found in the ore tank at the 75-foot level. The body struck below is the same vein and has widened from 22 inches to four feet. A new strike is also reported in a mine close to the Left Bower. The vein is four feet wide and the entire amount goes 300 ounces. Full particulars will be published in a few days. The Montana Copper Company started up several more calciners yesterday. The entire works will undoubtedly be in full blast inside of four weeks. During the history of Butte as a quartz mining camp there has never been as much winter prospecting as has been going on this season.

OREGON.

IRON ORE.—*Oregonian*, March 12: There was received here yesterday several specimens of magnetic iron ore from the Gasfield mine in Jackson county. The mine is located at Gold Hill station, on the O. & C. road, very close to the railroad track. Assays show that the ore contains 63 per cent and it richness may be understood when it is stated that 72 per cent is the highest known. Some specimens have been presented to the Oregon Board of Immigration, and some will be sent to New Orleans by Mr. C. W. Burrage, who is part owner in the mine.

SHORT SEASON.—Jacksonville *Times*, March 11: The mining season will be rather short, but still much better than several past. Water is getting light and most of the miners have commenced cleaning up. Wimer & Sons and Deselles & Connell of Waldo precinct are running day and night and will no doubt make a big cleanup. Simmons, Ennis & Co.'s mining enterprise near Waldo is progressing favorably. They expect to get their mine opened during the ensuing year. Many of the miners of Josephine county will soon be compelled to shut down, unless timely rains should come to their relief. Water is getting light there also. John A. Horn has discovered a promising quartz ledge on Applegate, in the vicinity of Ed. Hendrick's place. He showed us some specimens which contained considerable gold. The Enterprise mining Co. of this place has let a contract to an old California miner named Knapp to finish their shaft on Fir street. It is proposed to sink down 50 feet in all.

UTAH.

REVIEW.—Salt Lake *Tribune*, March 11: The week has been one of abnormally splendid weather, save one day of storm—Wednesday. The other days for a fortnight have been more like sunny mid-May days. The receipts of bullion and ore in Salt Lake City for the week ending March 11th, inclusive, were extremely light, being of bullion $39,998 36; of ore, $8,640.56, a total of $48,638.92. For the previous week the receipts were $66,669.66 of bullion and $18,257.87 of ore. The new Hanauer smelter started up on the 11th, after a suspension of two months, caused by the burning of the old works. The new smelter is of increased capacity, and its operation will have a decidedly favorable effect on the bullion output of the Territory. The Ontario shipped during the week 38 bars of bullion, assaying $27,489.36, bringing the product for the present year up to $305,594.73. The regular monthly dividend of 50 cents a share, or $75,000, continue without a break. The Horn Silver continues virtually idle, making no shipments of bullion. The Silver Reef country yielded during the week 8 silver bars, $4,560, of which the Christy sent up one, $1,460, and the Stormont two bars, $3,100. Jack Gilmer brought down a gold brick from the Kentuck mine below Salmon City valued at $4,000. The product of the Germania smelter for the week was two cars of bullion, $3,055. The ore receipts were $5,500 worth from the Crescent, $1,000 from the Eureka and $2,140.56 Wood River ore. A strike of 6 ft of carbonate ore has been made in the west ground of the Ashland mine in Bingham. The Ashland is near the old Neptune mine and is the property of George Hearst & Co., but is being worked under a lease to Bemis & Cree. Deignan & Co. have struck 3 or 4 ft of carbonate ore in their new tunnel on the Ten-Forty mine in Bingham. Work on the Nast mine is progressing favorably, and all the prospects in and about Car and Muddy Forks in the Old Reliable camp are said to be looking well. The snow in the Park, Bingham and Ophir is rapidly disappearing. The Vallejo Mining Company, whose works were destroyed by the late snowslide in Alta, has sent men up to the mine to commence the work of repair. A number of mining properties in Ophir have been released by the owners to parties who will go to work on them.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

"NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be discarded from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." NOTICE

Is hereby given that a meeting of the stockholders of the Lord of Lorn Gold and Silver Mining Company (a corporation) will be held on the 11th day of May, A. D. 1885, at one o'clock P. M., at the office of said corporation, in room No. 6, in building No. 318 Pine street, in the City and County of San Francisco, California, for the purpose and with the object: First, of increasing the capital stock of said corporation, so that the whole amount or par value thereof shall be $10,800,000, divided into 108,000 shares of the par value of $100 each; and, Second, to repeal the by-laws of said corporation, or any part thereof, and to amend the by-laws, or to adopt new by-laws therefor, as said meeting may determine. By order of the Board of Directors and Trustees, and of the President. March 7, 1885. JAS. T. McDOUGALL, President.

R. N. VAN BRUNT, Secretary.

FOR SALE—TITLE U. S. PATENT.

A one-half interest, or the whole, of a valuable GOLD MINE, situated in the Quartzburg Mining District, Mariposa County, Cal. This Quartz Mine prospects from $30 to $90 per ton in gold upon the pay streak, and will pay $15 per ton, average, for all the ores. It is a 3-foot ledge, and a double compartment shaft is now down 200 feet. A mill and reduction works are now well under way; a boarding-house completed, and a water ditch, and a large part of the machinery bought and erected; roads made, etc. The only reason for selling any part is, that the owners lack sufficient means to put the property into productive shape. For further information address, GILBERT CLEMENTS, 318 Front St., San Francisco.

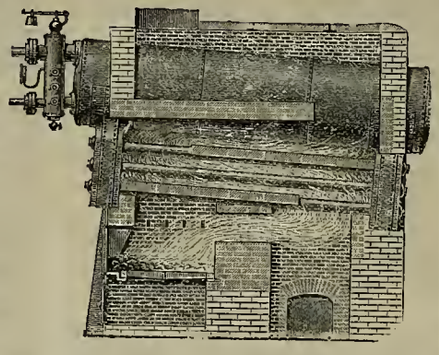
Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

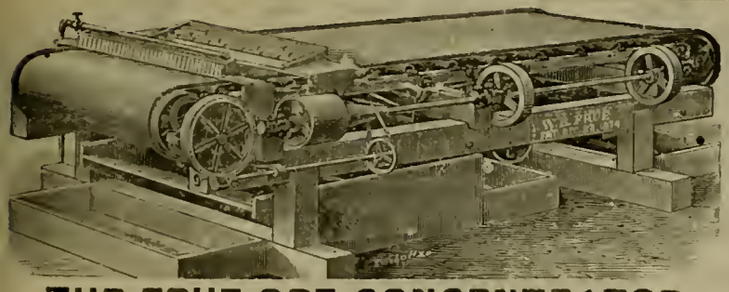
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

RANKIN, BRAYTON & CO.,
...BUILDERS OF....
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 130 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

HOISTING WORKS

Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

The Interoceanic Ship Railway.

Continued from Last Issue.

As stated in the article in last week's PRESS, the road is designed to be almost exactly straight, since there will be no curves having a radius of less than 20 miles, for the carriage is

toon will be firmly grounded upon the circular bearers of the basin, when the carriage is run upon it, by the admission of water. This is pumped out by a powerful centrifugual pump, the water being drawn through the cylindrical pivot of the pontoon, which is hollow, and discharged into the basin. When the pontoon

over the Isthmian railway will not differ from those in ordinary use, except that they will have about twice the traction power of the most powerful locomotives that run on ordinary railroads. The big freight engines of the day have no difficulty, as we know, in drawing freight trains of a total of 1,500 tons; and as

of 5,000,000 tons in 1888 for any passage across the Isthmus. Four dollars the ton would be but a moderate charge—the Panama Railroad demands $15 a ton. This would give $20,000,000 as gross receipts. Now, it has been estimated that 40 per cent of this would pay all working expenses, thus leaving $12,000,000 all

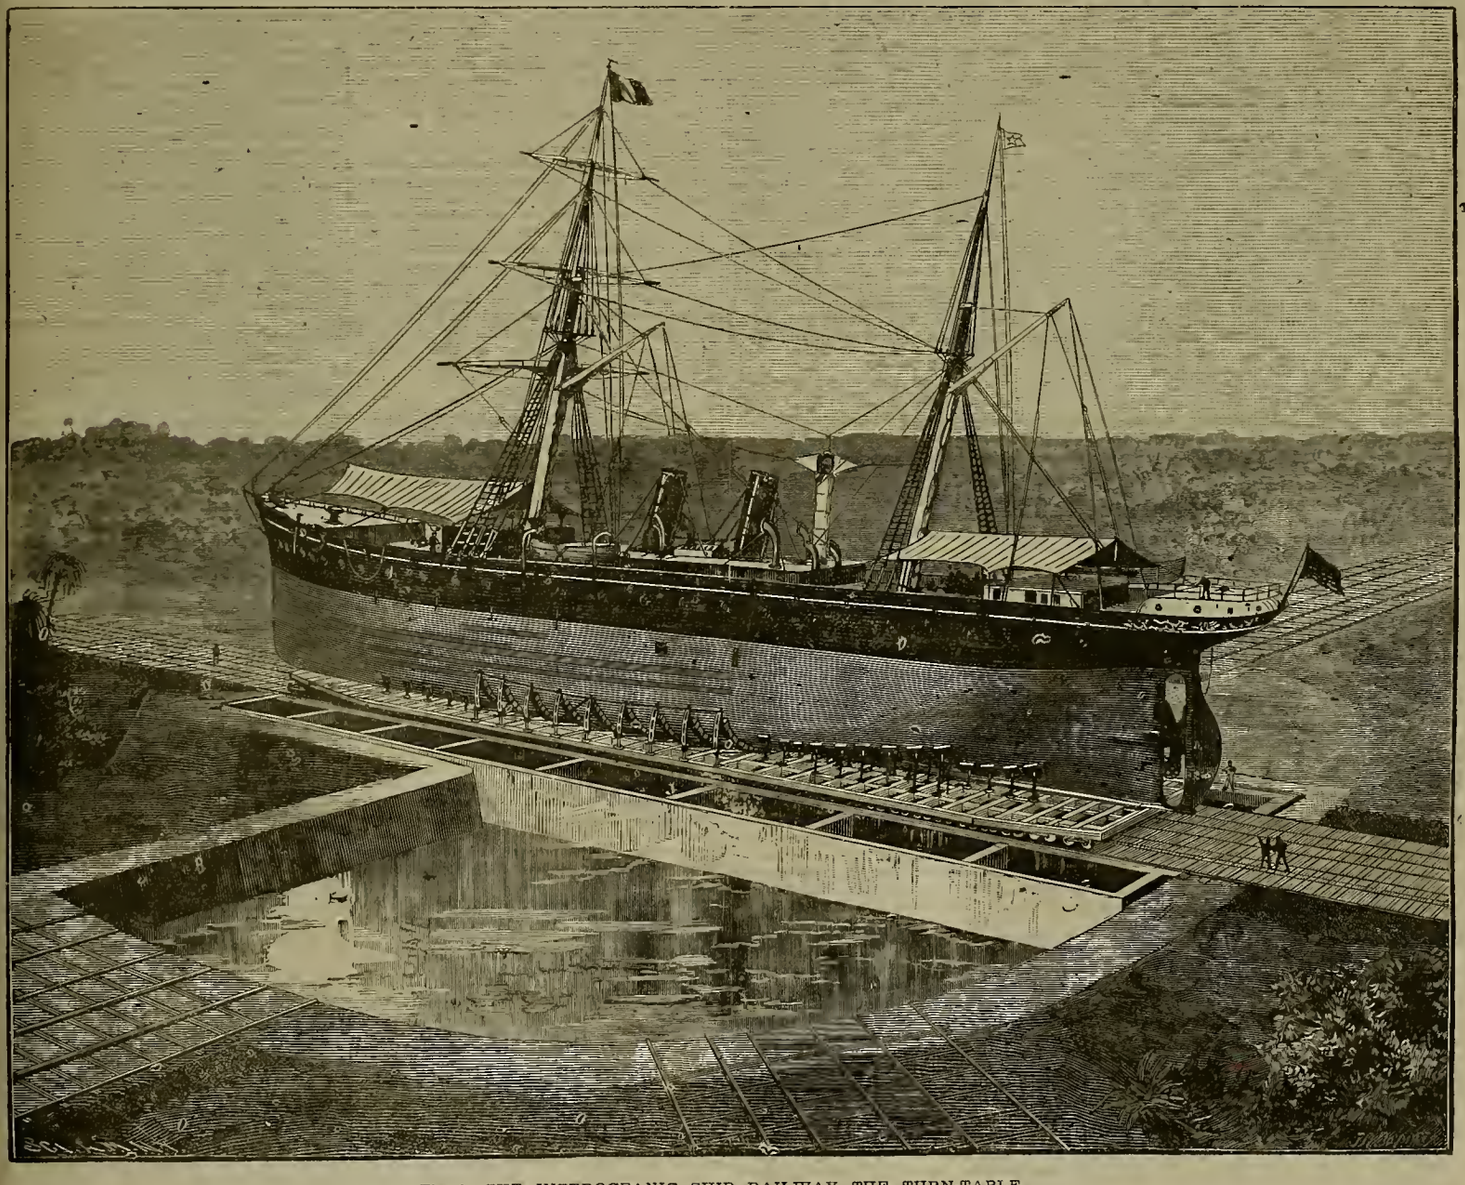

Fig. 1.—THE INTEROCEANIC SHIP RAILWAY—THE TURN-TABLE.

400 feet long, and rests upon wheels which, as already explained, are not set on trucks swinging to a common center. There are only five places in the whole line where it is necessary to deviate from a straight line, and at each of these places a floating turn-table will be built. Fig. 1 on this page gives a view of the floating turn-table, and Figs. 2–3, on page 205, are also illustrations of the turn-table system, which are self-explanatory. These turn-tables in design resemble pontoons, for they rest upon water, and will be strong enough to receive the carriage and its burden. The turn-table pon-

has been made sufficiently buoyant to be turned easily upon its pivot by steam power, the ship carriage is then quickly pointed in its new direction. The valves then permit the water to enter once more, and the pontoon turn-table again rests on its bearings. These turn-tables may be made to serve another purpose. By their means a ship can be run off on a siding, so to speak, where she can be scraped, painted, coppered, calked, or otherwise repaired without removal from her cradle, and thus be saved the heavy expense of going on a dry dock.

The locomotives for hauling the ship carriage

the ship carriage moves along three tracks it would be easy, if such a course were necessary, to place three locomotives in front of it and three behind. The time estimated for crossing from ocean to ocean is only 16 hours. The engraving (Fig. 4) on page 206 shows the method by which a steamship is to be carried over the railway.

The cost of the ship railway as computed by expert engineers will be about fifty million dollars ($50,000,000).

A careful estimate has shown that it would not be unreasonable to look for a gross tonnage

net profit, or 12 per cent on a capitalization of $100,000,000.

The Tehauntepec Ship Railway is a private enterprise that does not ask a dollar from the Government, and there will be little trouble in its construction, if the Government does not by legislation, or by committing itself to the Nicaragua canal scheme, injure its prospects and defeat its aim, which is to furnish a cheap, rapid and safe passage for ships across that narrow strip of land, which heretofore has proved an effectual barrier to aspiring canal builders.

The company supporting Mr. Eads and which

owns the concession granted by Mexico, and is composed of eome of the most wealtby and influential men in Pittsburg, St. Louis, New Orleans and other cities. They are thoroughly in earnest, and determined to build the ehip railway.

It is by far the shortest dis'ance by water between our Eastern and Western ports. It is a direct and necessary supplement to tbe Mississipi river, and is virtually its commercial extension into the Pacific Ocean.

While the benefits are iucalculable to the Mississippi valley and the Atlautic por s, and in fact to the whole of our country lying east of tbe Rocky mountains, the greatest and most direct benefits are those to be reached by our whole Pacific Coast. There is no doubt that the gradual decrease in ocean rates for freight has worked to the advantege of our Pacific coast, as the decrease in rail and ocean freights has been of immense advantage to the vast area lying west of tbe Mississippi river, even to the base of the Rocky mountains. Tbe cheapening of traneportation of agricultural products has changed this wilderness into a garden; but on the Pacific Coast, thougbhere are there, great natural advantages, no relief adequate to our wants has yet been devised. Railroade, several in number, bave been extended east and west and connected us with the Atlantic Coaet, but still we cannot reach Europe with our heavy products except by a voyage of about sixteen thousand miles. We bave a climate and a eoil the most favorable in tbe world for cereal productions; we can raise them as cheaply as any country—cheaper tban any other part of the United States; but not being able to reacb the world's markets except by a long and expensive voyage, we cannot compete with India and Australia sioce the opening of the Suez canal, and the wonderful development of those countries by the money and enterprise of Eog land. India, especially, ie crowding us out of the European markets. The Tehuantepec Sbip Railway ought to re-establieb our eupremacy in the wheat trade and wheat production. We can then compete with any country, for we will he brought two monthe nearer the European markets. It has been stated by experts on this suhject, that the successful inauguration and operation of tbe ship railway, will double our cereal productions within three years. But this is not all. It will bring us into more direct and intimate relations, both in manufactures and commerce with our own country from the Rio Grande to Maine. Tbe heavy and slow freights especially, tbat it does not pay to baul over the transcontinental railways, will then, by a quick voyage, be placed at Galveston, New Orleans, Baltimore, Philadelphia and New York and Boston for tbe use of the immense population tributary to these ports.

It is generally conceded in comparing land and water routes, that four miles of water tranportation on the ocean is equivalent in cost to one mile of rail transportatiou. See how this will figure out. The distance from San Francisco to New York hy the Central and Union Pacific Railways is 3,340 miles; by tbe Tehauntepec All-Water Route, 4,905 miles. By the above rule, the former is equivalent to 13,360 miles of water transportation. The distance from Sau Francisco to New Orleans is about 2,400 miles by rail and 3,576 by water, the former heing equivalent to 9,600 miles of water transportation. This gives the ship railway route an immense advantage over any present routee by rail, and, ae has been previouely seen, over any present water routes. And, from the distancee given in thie article, it aleo hae an advantage over any otber projected inter-oceauic route by meane of a canal.

As Commodore Schufeldt etated in 1871, in an official report of his survey of the Isthmue of Tehuantepec: Each istbmus riees into importance as it liee nearer to the center of the American commercial interests. Any intrineic value of this eminently national work ought to be based upon the inverec ratio of the dietance from that center.

An all-water route by way of Tehuantepec connecte the east and weet coast linee of the United Statee aud Mexico, and ae it were, rendere our own Territory circumnavigable.

Again, tbe conditions that we have given in reference to tbe winds and currents are very important to American commerce especially. It has been stated tbat sailing veesels are giving way rapidly to steamshipe; but from the late report of Mr. Jarvis Patten, tbe United Statee Commissioner of Navigation, we are diepoeed to helieve that the eailing ship etill holds ite own. For he gives as the total number of sea-going sailing shipe owned by citizens of the United Statee, 6114, with a tonnage of 2,099,218; while there are but 422 eteamships, with a tonnage of 601,186.

Another very important statement made by him is this:

That we in thie country, with our excellent woods, which can be obtained at reasonable pricee, can build sailing shipe at from $50 to $55 per ton; but that it costs us to build iron ehipe from $65 to $75 per ton. On the other hand, it coste England to build wooden sailing ships $75 to $80 per ton; but they can build iron ships at from $50 to $60 per ton.

It is therefore very important for our American commerce and for our merchant marine that tbe interoceanic route ehould he located where it can be ueed to advantage by our sailing vessels. The importance of this will be appreciated by every commercial man along the Atlantic and Pacific Coaets, for we are still building these fine wooden eailing ebipe for the San Francisco trade and for other sea-going business.

Again, if thie country desired to control the interoceanic route, and to be able to defend it, let it adopt a route that is capable of defense. At Tehuantepec, with a favorable treaty with the Government of Mexico, and by meane of railway lines that are extended and are extending from the United States to the Mexican capital, and beyond even to Tehuantepec by American citizens, a land force of 100,000 men could be quickly transported from tbe Pacific Coast, Mississippi valley and the Atlantic Coast to meet an invading force.

The Gulf of Mexico, if we have a navy that can do any defensive work, can be easily protected, as the only two outlete to it from the ocean are at the Florida Straits and between Yucatan and Cuba.

This route therefore is vastly superior to any other as a strategic point. Mexico ie a sister republic, hound to us witb ties that are growing etronger and stronger with every dollar of American money that is spent on her soil in building railroads and other constructions for the development of that country. She bas a population of 10,000,000. Wben free from tbe harassing complications which invasions of her soil and overturning of ber legitimate governments have brought upon her, she will be a strong republic, well advanced in agricultural, industrial and commercial prospects, and enabled to be an adequate ally of the United States.

There are already four main longitudinal trunk linee of railroad building, and in tbe course of construction from tbe American border.

Another immense advantage to the whole Pacific Coast by the construction of the sbip railway will be tbe impetus it will give to immigration from European countries. We need, especially for the increased cultivation of our soil that tbe ship railway will bring about, tbese hardy agricultural immigrants, who now do not reacb us, on account of the great expense of transportation over the transcontinental railroads. With our country filled up with these industrious people, who so easily will become a part of our body politic, we can then relegate to their own country the unassimilating Chinese population tbat have infested our coast.

Now that tbe Congress of the United States has refused to ratify the Nicaraugua canal treaty, and there are sucb grave douhts in regard to the completion of the Panama canal, we must rely upon the Tebauntepec Ship Railway as the eolution of this great problem of transportation so directly and essentially effecting our prosperity.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Arizona.

Mojave County Mining Districts.

[From our Traveling Correspondent.]

The surface indications of the many districts of Mojave county indicate the existence of great wealth. Gold and silver ores, free-milling and smelting, abound in numerous formations. Nowhere in tbe Territory, or on the coast for tbat matter, do the indicatione juetify tbe outlay of capital or ehow the neglect of legitimate mining as this rich and undeveloped county. Mismanagement of capital and extravagant farmer or commercial "mining euperintendents," who epent the money given them for development for wine, women and tbrasbing machines, contrators or mille and macbinery necessary for a mine long before they had done even enough development to uncover mineral, or had learned the treatment required for their oree, has hurt Mojave'e reputation away from home.

High Priced Prospects.

Tbe greateet drawback to tbie, ae well as any other district, ie tbe ueual high-priced miner. Nearly every good-looking prospect in the county is owned by a poor miner, and not one in ten would sell their prospect at anytbing near its actual value. Tbis and a deeire to have low rates on ore, a home emelter and eomebody to take out their ores, appeare to bave been the leading characteristics of miners of this district in tbe past. Twenty thoueand dollare expended in Mojave county on a good prospect, in a eyetematic and bueineee-like manner, would develop more ground and produce more bullion than four timee that amount expended by a few hundred men in the happy-go-lucky way of the chloriders and prospectors of the county.

The Ores and Markets.

The mineralized rocke of the district are gold, lead and argentiferous. Veins, ledgee, depoeits and fissuree are claimed as ore producing; tbe ores being both free-milling and smelting. Miners can eell their ores at Kingman etation at 90 per cent of their assay value. The working chargee on the same bring $30 per ton. Sampling charges $5 per ton. The basie of settlement for oree ie made on the New York quotations of eilver and upon the reeult of the scorifioation assay, which is the standard baeie of the Eaetern market. The Colorado and Eaetern markets get most of the ore ehipments of this district. Tbe following prices will sbow what ores bring at Kingman.

Ounces per ton.....	150	Price per ton.....	$113.10
" "	200	" "	160.80
" "	250	" "	208.50
" "	300	" "	256.20
" "	500	" "	447.00

Tbe freight and treatment on ores shipped to Pueblo and Denver is $26.25 per ton. Nothing less than $50 ore will pay to handle thus. Several cars per month are sbipped to Colorado. There is talk of ex-Governor J. B. Grant, of Colorado, building a emelter at Albuquerque, New Mexico. If this is done and low rates are given by the A. & P. people, there will be a boom in the mining interests of all the districts tributary to tbe line of tbe road, and immense dumps of low grade ores that cannot now be handled will pay handsomely for ebipment.

Mining Districte.

Soutb of the line of the A. &. P., 10 miles from Kingman, is the Maynard district. The American Flag, tbe leading mine, is quite extensively developed; the ore is sulpheret and chloride and runs on an average about 100 oz. per ton. Tbe cost of packing and freighting ore to Kingman is $10 per ton.

Ceader valley, some 30 miles further south, boaste of producing some wonderfully rich ore. A few days since 10 sacks of ore weighiug 1,000 pounds was brought to Kingman from tbe Hibernia mine and eold for $250. Water and wood are not very scarce in these districts. Access to some of the minee is eomewbat difficult, and jacks are used to pack ore to the wagon roads, tbue making it more expensive to freigbt the ores to market. Work will be carried on extensively in tbis dietrict during the coming summer.

North of tbe railroad are a number of districts more or less rich iu the making of good mines. Stockton Hill, some 10 miles from Kingman, is attracting attention hy recent rich strikes in galena, wire, and ruby silver deposits that run all the way from 53 ozs. silver and 30 per cent lead to tbe pure etuff.

Mineral Park is a "has been" camp of much notoriety, and has yet untold and undiscovered wealth that only requires capital to expose. Very little is being done in or about the camp. It is tbe county eeat and its inhabitants are not many more tban are needed to run the affairs of the county and the mercantile and irrigation (saloons) bueiness of the place.

Gold Basin, Sau Francisco, Lost Basin and a number of other quartz gold-bearing districts are adjacent to the Park, and there has been some fine prospects found of late, and a number of stamp mills will be put up this summer. Tbe ores run from $20 to $200 per ton.

Sluicings.

The Tigress, at Stockton Hill, is shipping ore to Kingman.

John Mackenzie, the popular ex-County Clerk, has a bonanza in Indian Boy mine, at Stockton Hill. Their recent find of wire silver beats anything of tbe kind in the county.

Deputy Sheriff Keuncer and others have a fine gold mine in tbe San Francieco district.

Postmaster Krider, of Mineral Park, is largely interested in Gold Basin mines.

Roe Brothers, of the Park, will work a number of claims in the Salt Springs district thie summer.

Among other future millionaires at preseut working "*incog*" is J. W. Hass, who is running a 300-foot tunnel on the Woodchoppere' Relief.

Bob Steen, the eheriff of Mojave, is very popular among the minere.

The 10-etaup mill of Hon. John Howell, at Hockberry, ie cleaning up on a lot of chlorider'e ore, and will cloee down for some time.

Tbe Lone Star mine at Mineral Park ie the moet exteneively developed property in the county. It ie not working at preeent. J. L. Sanderson and othere of San Francisco are tbe ownere.

A emelter at Albuquerque and low ratee on oree will double Mojave county's output of bullion.

Prospectors are rustling among the hills, and the eeaeon'e work will develop a number of good mines.

Tbe *Mojave County Miner*, at Mineral Park, ie fully alive to tbe intereste of the miner and mine owner as well ae to its readere abroad. It deeervee the eupport of tbe community.

F. W. S.

Kingman, A. T., March 22, 1885.

A California View of the Eads Ship Railway.

Some time since, L. F. Moulton, a well-known reeident of Colnea, and who hae alwaye taken great interest in public enterpriees, especially thoee affec ing thie coast, wrote an extended letter on the subject of the Eads Ship Railway, which was published and attracted considerable attention. Space precludee our publishing it entire, but we make the following extracts:

To the Mechanics of California:—The farmer ie full partner with the San Francieco and other mechanics and manufacturers. Until we can get cheap freight we cannot raiee wheat to load ehipe to foreign countriee that can bring back *cheap* or *half* freights like coal, iron and all other raw material which is required to manufacture all classes of goode and machinery, cheap and good enough to compete with Eastern manufactured articles that will be brought at sufficiently low rates on the return wheat cars, so as to crush out our flourishing manufactures on this coast. It is reasonable to expect that if either become crippled by having to pay full freights—say one per cent per pound one way, and empty tbe other—tbat one of the partners must be crushed, thereby crushing both. Once our farming, our manufacturing interest, gone or crippled, and all other interests dependent upon once crippled, then the railwey companies would have to pay their taxes instead of refusing, as now. If tbey did not it would be hard indeed on those left, who had property and could not control the Government in their interest.

To the Farmers of California:—Our great distance from market is our great misfortune—the actual cost of transportation absorbs our profits.

Tbe past history of higb freights is a terrible lesson for us to study.

Is there any reason to hope that it will be better? We see no reasonable grounds for hope in the future. It bas cost 1¼ cents per lb. to market our wheat. This is more than it is frequently worth in the East. It would be so to-day were it not for tbe prospect tbat there would not be wheat enough grown to load the ships on tbe way thie year. The railroad, it may be claimed hy its agents, is now carrying for 65 oents per hundred to tbe very markets that are eometimes glad to get 65 cente for tbeir wheat. The head railroad agent, two weeks ago, said tbey could uot carry wheat for less than one cent per pound to New Orleans; tben it would bave to be reloaded in that yellow fever climate on to Liverpool ships; so that it would tben cost more than 1¼ cts. freight to Liverpool; then add our cost of raising, sacking and getting to the nearest sbipping points, and we would be toiling with no other future than inevitable ruin before us. If we have a little lower freight now, it will be just what we have dreaded and before pointed out; for do you suppose ships will again return to put themeelves under the despotic power of that railroad company tbat has proven itself entirely soulless and terribly despotic and grasping? Yes, in every instance where they bave bad the power, they bave proven themselves tyrents. Do you suppose they are any different now? You certainly could not be so silly as that. You know better. Tbe Hon. W. S. Green, in a well-written article in the Colusa *Sun* about a year ago, pointed out the fact that the railroad company would carry freight low for one season in order to discourage tbe return of ehips. Of course it created some adverse criticism by the railroad press.

I expected and every other farmer in the State expected to find euch to be the case, and we dreaded it, for the same reason that the sailor dreads the calm more than the storm. We need tbe etorm of competition to save us.

But, no matter bow much competition we may have, we cannot get rid of the fact that by water we are 14,000 miles away from the market, and by rail it actuelly coets more tban we can make to raise it and compete witb the fast increase of wheat produced nearer to market. We must have a cbeaper route, wbere grain will not, on tbe one band, have to be carried 14,000 miles, or be resbipped iu sickly ports on tbe otber.

Tbe ship railroad is our only bope. We must make our representativee understand our wishes. The Panama canal is tbe better of tbe two canale, but we have got to back down from our long-cheriebed Monroe Doctrine if we let monarchies get control of it as the English bave the Suez. Then again, it will take 25 years to build it. Tbere is 123 inches of rainfall and it ie 35 feet below eea level, with unknown quantitiee of water to contend witb, having no drainage for 30 feet in the bottom. It is one of the eicklieet climates in the world. The Nicaraugua I examined tbirty years ago. I thought then as I think now, that it can be built; but a canal with "locks" is too elow, too coetly and takee too long to build, for locke belong to a former age. Nicaraugua is aleo a bad climate. Tbey have jigger and otber fatal pests to contend with. Tbis progreesive age demands (if at all) a canal without locks (and it may be built by future generations), but we need in the next four years tbe railroad to croes our ehips from ocean to ocean. To defend eo long a coast as we would have to defend, to enforce the Monroe Doctrine and pay expenee of wars, would build eeveral ehip railroade. Then, again it would be tbe quickest way to settle the Monroe Doctrine to build our home route from tbe Gulf of Mexico inetead of going as far ae Nicaraugua or Panama to get into a row—and the safest way to avert a war is to hurry up the ship railroad. Then declining monarchies will not build another route for glory alone. If Eads' concession from the Mexican Goverment ie passed under control of our Government, as provided in this hill, then it protecte us from these eoullees corporations; hut let him be broken down by Page and the railroad company, tben his franchise will have to paes into other than United States possession; the railroad company will be sure to get a controlling intereet, ae they have just got of the new railroad, or else they will pool their issues as they have with the Panama Railroad. Our hope is in this cheap and speedy ehip railroad, and it under control of the United States Government.

THE bill for redietrioting the State of Nevada for judioial purposes, making one entire dietrict of the State, has passed the Senate.

MECHANICAL PROGRESS.

A New Manufacture.

Mr. Rosenzi, an Italian, has established a new manufacture at Bridgetou, N. Y.; or rather has re-established a lost art, that of manufacturing mirrors from obsidian. The results of his experiments are pronounced highly satisfactory.

The art of manufacturing obsidian mirrors was lost in the 12th or 13th century. It was re-discovered and patented December 23d, 1884, by Enrico Roscuzi, of Pittsburg, Pa. The obsidian mirror was long used by the ancients for looking-glasses, and by astronomers as reflectors on astronomical instruments. The substance, obsidian, is a kind of volcanic glass, artificially composed by the inventor, of ingredients such as ashes, silex, soda, lime, etc. The reflections in the obsidian mirrors are as clear and distinct as those seen in the brightest glass mirrors, but more subdued and condensed by a tint that gives the reflected images a peculiar charm. The perfection and beauty of these mirrors can be fully appreciated only by a personal examination. The high degree of polish of which this substance is susceptible adapts it above all other materials for tiles, plaques, bureaus, table tops, furniture garniture, etc. Any design in relief with raised or sunken figures can be pressed into this material. Being entirely opaque, it is adapted for fruit and other preserve jars, any kind of bottles, and especially for those holding drugs and chemicals not to be exposed to light.

Experiments with Steel Sleepers.—The experiments upon the Northeastern railway with iron sleepers have not been altogether successful. But the company are not at all disposed to abandon the idea of laying down metal sleepers. They are having sleepers rolled at Barrow on Mr. F. W. Webb's principle. They are rolled to the requisite tough-like section. Under each rail is a sole-plate to strengthen it there. The chair is formed of two jaws minds of steel plate, stamped into form, and ribbed centrally, so as to give strength to resist the pressure of the wedges. The jaws, sole-plate, and sleeper are united by rivets passing through the three thicknesses. The test will be very severe, because on the two miles on which the sleepers are to be laid there is a great deal of the roughest mineral traffic. The iron sleepers on Mr. Wood's system which these sleepers of Webb's are intended to replace were sufficiently elastic, and did not rust sensibly; but being seriously weakened by the large holes needed by Mr. Wood's peculiar fastenings, and these holes being situated on either side of the rail, just where the strain on the sleepers was greatest, the latter were continually breaking there. It became obvious that iron sleepers were right in principle but that the particular system tried is not yet perfect in detail.

Oxidized Surfaces.—Cast iron seems to have a color of its own that cannot be excelled by the finest tint that can be given by a coating of paint. The red oxide of iron, or the oxidation of the exposed particles, presents a surface that is very much admired for its durability and permanence, as shown in the browning of a gun-barrel with acids. Even the surface that has been allowed to dry with the acid still on, in which the casting has been pickled to remove the scale, is left brown with oxide that blends very beautifully with a petroleum wash, and leaves a very mellow tint that is not easily tarnished. The application of heat in the fluing of steel forms a similar coloring of oxide that prevents the further oxidation of the metal and brings out an agreeable color that is quite attractive. The wood-worker also is aware of all the changes in texture by oxidation and brings out the latent color in the finish of wood-work without any paint whatever, by etching the lumber, as soon as it is sawed into boards, with so small an air space between that they actually heat, sweat and ferment on their surfaces, by the oxidizing of the juices and saps, producing a partial decay similar in many respects to the rusting of iron.

Material for Shaft Bearings.—The material for the bearings or boxes of shafts has from time immemorial been a favorite theme for discussion among mechanics. Some claim that cast iron is the best material; others say that boxes lined with babbit metal come the nearest to perfect boxes of anything. The argument in favor of cast iron is based on the claims of economy, it being much cheaper than any other material, and they add that it runs easier, and will wear longer if properly lubricated, but we find by actually weighing the force or power required to overcome the friction of the two substances that the argument should be strongly in favor of babbit-lined boxes, the main trouble being to keep them properly lubricated. The best of boxes in the best regulated shops will occasionally run dry, and the risk of cutting a shaft is one that no one can afford to assume. With the best lubricators it is best, as well as practical, to give a shaft the odds, for in the long run all who try it will speak warmly in favor of the box lined with babbit or some other kindred soft metal.—*The Wood Worker.*

Bits on Belts.—There are few people who pay any attention as to how they put on a cross belt. The right way to do it is to put the belt on in such a manner that the driving pulley will have a tendency to rough up the splices; then when the splices come to the crossing they will smooth each other down instead of catching under the corners of each other and tearing open a splice. A quarter-twist belt should never be used where it can be avoided, but when it is used it should be as narrow as practicable, and the pulleys should be large. Increasing the width of a quarter-twist does not increase its power in the same ratio as in a straight or cross belt. There is not more than one per cent advantage in using an oiled belt with the grain side next to the pulley, which will hardly compensate for the ugly look which a belt presents when put on in that manner.—*American Wood Worker.*

Steel Shafts Forbidden. John Roach has received orders from the naval department to substitute iron for steel shafts in all the vessels he has under construction. This order appears to be the result of the investigation as to the reliability of steel shafts that was instituted after the accident to the shaft of the Dolphin during her trial trip. A good many engineers will say that the government has taken a backward step in abandoning steel for shafts, but we think on the whole the action is wise. John Roach has never had any of the iron shafts he put into steamers break, and the indications are that good iron is not so susceptible to the structural changes induced by fatigue as steel is. There is an impression among many mechanics that steel is treacherous, for it will break occasionally in an unaccountable way. Cases where breakage occurs under strains that a steel article ought to have withstood without distress, might probably be traced to natural causes were the matter properly investigated, but this has not been done, and so long "mysterious" breakages are common, the material will not have the entire confidence of the engineering world.

New Process for Working Iron.—An improved process in the treatment of iron has been brought to notice, the results of which are alleged to be very favorable, the product being very hard and tough—far superior, in fact, to ordinary rolled iron for any usual purpose. According to this method, wrought iron is heated to nearly a welding heat, is then rolled in sand, reheated to a somewhat higher temperature than before, and another rolling in sand is given; after that it is once more heated to the welding point and then immediately immersed in water, to which has been added common salt in the proportion of one gallon of salt to 12 or 15 of water, more or less. Among the advantages claimed to be possessed by iron made in this manner are those of being heated, worked, welded and otherwise manipulated without the destruction of any of its valuable properties.

The Physical Properties of Metals—A Prize Offer.—A Berlin paper says that a prize has been offered by parties in that city for essays, as follows: $250 for the best comparative examination of the several methods heretofore used for the determination of the hardness of metals and alloys, including an exposition of their sources of error, and limits of accuracy; and $750 for the best paper on the resistance to pressure of iron work in buildings, at increased temperatures. It appears that after a certain fire in a factory at Berlin, the police authorities issued notices concerning the use of cast iron columns in high buildings, and that these notices met with considerable opposition in many quarters, since it was maintained that neither practice nor theory had yet shown any proof that cast iron is less trustworthy than wrought iron in cases of fire.

Wasted Power.—The amount of power wasted by shafting out of line, badly lubricated, of insufficient size and imperfectly coupled, can hardly be estimated. Great as is this loss, that from badly laced, crooked, stiff and generally outrageous belting is but little less. In some establishments a belt lacing of sufficient size for the main belt of the establishment is considered plenty good enough to lace a three-inch belt with and is used accordingly. A punch large enough to make holes for the biggest lacings is, of course, necessary, and it has the advantage of answering for all sizes of belts. The apparent advantage of having but one size in a large establishment is captivating to the business department. The result in belt efficiency, however, is something which would astonish the counting house, if it could be made to understand the figures.—*Industrial America.*

Looking for American Machinery.—Commissioners from Chili will visit the New Orleans Exposition and report on the machinery most suitable for adoption by farmers in Chili. As labor is growing scarce and produce somewhat low at present, more machinery is required than formerly. The Government of Chili has for this reason devoted large space in the National exhibition at Santiago for the receipt of American machinery and manufactures, where they will be placed on exhibit by the authorities free of duty.

Steel Ships as Cheap as Iron Ships.—The manufacture of mild steel by the Bessemer process has been so greatly reduced in cost in England, that steel ships and iron ships of the same class are now offered at precisely the same price. This possibility arises largely from the fact that a steel ship of a given strength can be made of much lighter weight than one of iron,

SCIENTIFIC PROGRESS.

Where Did Life Begin?

President Warren, of Boston, thinks he has succeeded in solving the problem as to where animal and vegetable life commenced. His researches, he says, have led him to fix that point at the North Pole. The doctor sustains his theory with much energy and with a surprising array of evidence, and this in turn throws much light on the most vital of the current problems of biology, terrestrial physics, ancient cosmology, comparative mythology, primeval history, scientific anthropology, and Hebrew and ethnic traditions. He claims to have given to the work the study of many years. He says the poles were first fitted to produce life, which consequently commenced at the northern and southern extremities of the globe, developing independently, but to a certain extent corresspondingly, since conditions were similar. By the secular cooling of the globe the poles ultimately became unfitted to support life, and such forms as did not perish in the changes of the earth's surface slowly migrated toward the equator, changing in the course of ages, and ultimately giving rise to a fauna which, over most of the globe, consists of a mixture of northern and southern forms.

Many facts derived from the Northern Hemisphere lend support to this theory, and the Southern Hemisphere has recently added new facts which tell in the same direction. The animals of the Northern Hemisphere are still almost identical throughout the world's circuit. The same families and even the same species of mammals and birds are common to the north of the Old World and of the New. To give a few examples, the elk or moose, the reindeer, the beaver, the lynx, the wolf, the fox of Europe and Asia, are specifically identical with those of America. The bison of America is closely allied to the aurochs of Europe, the brown bear of Europe, to our own grizzly, the stag to the wapiti or elk, and and so on.

Remains of mammals now regarded as tropical, such as the elephant, hippopotamus, rhinoceros, hyena, lion, etc—are common in the tertiary strata of temperate and even arctic regions. This is proof of southern migration when climate changed. In the southern point of South America, in desolate Patagonia, have been found mammalian remains which tend to show that the tertiary fauna of Patagonia preceded that of the Argentine Republic, to the north of it. Forms of the pampas are there, but are somewhat more generalized, as though older. Hooker has shown that seventy-seven species of plants are common to South America, New Zealand and Tasmania. A small family of fishes (*galaxidæ*) and the marsupialia (kangaroos, wombat, opossum, etc.) are Australian and South American.

A sort of submarine plateau connects Staten Island (part of the Terra del Fuego archipelago) with South Georgia and other antarctic lands, and it seems not unlikely that a great antarctic continent once existed, the remains of which are Australia, New Zealand, etc., on the one hand, and Patagonia on the other. In Australia the marsupialia multiplied, and spreading northward, mingled with the horsal fauna that had been driven southward. In South America the marsupialia did not greatly multiply, though they spread, after the upheaval of the Isthmus of Panama, into North America, where they are represented by the opossum.

The edentata (sloths, armadillos, anteaters and their relations) first appeared in Patagonia in the miocene period, and spreading northward, became the characteristic animals of South America. Edentates (the aard-vark or Cape anteater, and the pangolins or scaly anteaters) occur also in Africa, which was probably once connected southward with the ancient antarctic continent.

In many cases the animals of northern origin, which are the more numerous, can be distinguished from the southern, but in other cases we cannot distinguish them, since on the one hand, animals which naturalists place in the same family on account of resemblances in structure may very possibly have had a distinct ancestry, and, on the other hand, the northern forms, which evidently predominate, have not only varied greatly in the course of ages, but have penetrated far toward the southern extremities of the continents. As regards the Northern Hemisphere, the resemblances between the fishes, insects and mollusca of the Old World and the New are even more striking than those of the higher animals.

Method of Removing Obstructions from Pneumatic Tubes.—No method has yet been discovered, it would appear, for removing obstructions from pneumatic tubes, preferable to that resorted to in Paris—ite location being determined by simply firing a pistol into the tube. The resulting wave of compressed air, traversing the tube at the rate of 1000 feet a second, strikes the impediment, and is then deflected back to its origin, where it strikes against a delicate diaphragm, its arrival being recorded electrically upon a very sensitive chronograph on which, also, the instant of firing the pistol has been recorded previously. The wave of sound, on reaching the diaphragm, is recorded, and thence reflected back—a second time striking the obstacle, and returning to the diaphragm. This operation being several times repeated, several successive measurements are thus made of the time required by the sound-wave to traverse to and fro within the pneumatic tubs. Other means have been applied to the accomplishment of the object in question, but this has proved to possess special advantages.

Santa Barbara Natural History Society.

We find in the Santa Barbara *Press* of the 7th inst. a report of a meeting of the Santa Barbara Natural History Society, held Feb. 22d. After some preliminary business several original papers were read, when Mr. Ford read extracts from a private congratulatory letter from Prof. Henshaw on the purchase of the Clark collection. The professor, in his letter, said that he had succeeded in obtaining vocabularies of the languages of the natives racss in San Diego. Mr. Ford, also, read from a privats letter from the distinguished botanist, Dr. Asa Grey, from which it appears that the doctor contemplates a visit to Santa Barbara. We notice, as a pleasant and commendable feature in connection with this society, that it contains quite a number of lady members, several of whom take an active interest in scientific matters. Rev. Mr. Weldon addressed the society upon the subject of the late, and still pending controversy, the antiquity of the Calaveras skull, and, also of the human remains found, together with those of extinct species of animals, in the auriferous gravel beneath Table Mountain, Tuolumne county, Cal. Mr. Weldon said that he had visited the rooms of Dr. L. G. Yates, of Santa Barbara, and had there examined plaster casts of the fossils, said to have been discovered beneath Table Mountain. Some of these casts, beyond question, represented perfect human hands. They were more perfect than any yet found in Europe. He doubted that they were of the Pliocene age. They were more ancient than the Calaveras or Whitney skull and were, without question, genuine. No remains have ever been found before to which such age could be attached. But he doubted that a drift formation, overlaid by a lava formation, could have said to belong to the Pliocene age. The casts, which he referred to, are the most interesting specimens in any museum in the world.

C. W. Clark and George W. Coffin were unanimously elected members, and the names of Harvey Jacobs, Henry Short, Alex Silas Bond, Dr. J. B. Shaw and Capt. W. E. Greenwell, were presented by H. C. Ford and Clark P. Streeter for membership.

The Value of Sponge for Filtering Distilled Water.—Experiments have shown that sponge is very valuable for filtering material for distilled water—the operation going on with great rapidity, while the product is remarkably clear. Distilled water, when filtered through paper, soon exhibits a sediment which is never formed when filtered through sponge. This improved apparatus consists of a bottle with an opening near the bottom, from which descends a bent glass tube, with a perforated rubber stopper at each end bearing a narrower glass tube. The wide tube contains one or two long strips of fine sponge that have been cleaned with diluted hydrochloric acid and then dried. The sponge should be cleaned every few months.

Cocoa Powder.—A New Explosive.—This powder is referred to in European journals as an improved explosive for many purposes. It is used at Krupp's factory. It is claimed that with equal pressure it gives greater velocity to a ball than can be attained with ordinary powder. Its smoke is said to be less dense and to clear off more quickly. It is brown, or rather, chocolate colored. In sundry tests about one-seventh less of it was needed than of ordinary powder to produce given results. Its merit is that of beginning its combustion moderately and steadily and then when the projectile has started through the bore, burning with great rapidity.

Velocity of a Cannon Ball.—A London scientist says that the highest velocity that has been imparted to a cannon ball is 1626 feet per second, equal to a mile in 3.2 seconds. The velocity of the earth at the equator, due to rotation on its axis, is 1000 miles per hour, or a mile in 3.6 seconds; and thus, if a cannon ball was fired due west, and could maintain its initial velocity, it would beat the sun in its apparent journey around the earth.

A New Destructive Missile.—A new shrapnell shell for 100-ton guns has been invented by an Italian admiral. At 30 yards from the cannon's mouth the shell bursts, throwing forward 75 smaller projectiles, which in their turn burst into a fan-shaped shower of balls and fragments of metal with terribly destructive effect.

Plant Intelligence (?).—A London botanist has endeavored to prove that plants have a certain form of intelligence, and are able, at least, to exert as voluntary power as certain lowly organized animals. One proof of this is the plants' avoidance of obstacles placed artificially in their way by bending aside before touching.

An Astronomical Observation of an earthquake was lately made by the director of the observatory at Nice, France. He was watching one of Saturn's moons at the moment of the shock, and the motion imparted to his telescope caused the celestial object to appear to move some 15 or 20 seconds to the right.

Passing Events.

As we write (Thursday afternoon) telegraphic news announces that war is probable between England and Russia. While it is hardly proper to express pleasure at the misfortunes of other nations, war between these two cannot fail to be of benefit to this country, and to this State in particular. America will be called on for supplies, and California wheat ought to be largely increased in value for export. At least, these are the opinions which find expression among our people.

In another column, reference is made to the trouble among the Wood River mines over the wages question. It is hoped by this time that quiet once more reigns.

The Old Dominion copper mine in Arizona will probably have to reduce its product for a while, for the reasons given in the item in our mining summary. The mine is a great copper producer.

The cloudy weather early in the week gave hopes of rain though but little has fallen. There are fears of a "dry season," though it is too soon yet to give up all hopes of an abundant rainfall, for April is often a rainy month with us.

ONLY about 964 tons of fine copper were sent to England from this country in February.

Working Cupriferous Pyrites.

Hydrochloric acid being a waste product at the chemical manufacturing centers in Europe, is there largely used as a solvent of copper oxide, and to assist in the decomposition of sulphurets; but far more copper is rendered soluble by the action of salt on sulphureted ore in the roasting furnace than by the direct action of acid. Longwaid's original patent of 1844 was a method of extracting copper in this way, and Henderson long afterward patented the essential points of Longwaid's process, adding to the roasting furnace a tower to condense the gases evolved in the calciner, and thus acidulate the leach liquors. As practiced at present in England, where about 20,000 tons of metallic copper a year are made by it, the following are the steps of the process:

The pyrites cinder as it comes from the acid works contains on an average: Copper as sulphide, 1.65 per cent; copper as sulphate and oxide, 2.10 per cent; iron as sulphide, 3.64; as peroxide, 77.40; silver, 0.0037 per cent; there are also small quantities of zinc, lead, lime, arsenic, etc.

There must be at least as much sulphur present as there is copper. The cinder is ground through screens with eight holes to the linear inch, 8 to 17 per cent of salt being added, according to the furnace used. The quantity which can be chloridized per day varies with the furnace used, but the rate of calcination may be set down, according to Mr. James Douglas, Jr., at 9 to 10 tons per day per furnace, fed usually in three charges. The heat is never varied above a dull red, the limit within which the copper is most effectually chloridized without being volatilized. Where gas furnaces are used extraneous heat is applied for about three hours. By that time the reaction between the sulphur and salt is proceeding vigorously, and the gas is turned almost off, for the heat evolved in the roasting mass, which is repeatedly rabbled, maintains a sufficient temperature. The chlorination is completed in 6½ hours, when the charge should contain 71 per cent of the copper as chloride; 4 per cent (or not over) of the copper as subchloride; 20 per cent of the copper as oxide and 5 per cent (or not over) of the copper as sulphide.

Muffles, or combined muffles and reverberatories, as well as mechanical furnaces, are used; but in all cases the gases are carried from the furnace through Gossage towers, where an acid leach liquor is obtained. But generally the acid thus condensed is insufficient to dissolve the oxide of copper in the roast, and free hydrochloric acid has to be used as a final bath. The chloridized ore is thrown hot upon the false bottom of large wooden leach-tanks, holding 10 tons, and is washed first with weak liquors from a previous operation, then with water, and finally with the tower, and if necessary with additional acid liquors. The filling, leaching and emptying occupy 48 hours. The liquors passed to the precipitating vats contain from five to six per cent of copper. The residues generally contain: Copper 0.15 per cent; iron as peroxide, 90.61 per cent, which equals 63.42 per cent of metallic iron. The precipitation is always effected by iron, and the chlorides of iron and sodium, and sulphate of soda in the resulting liquors are run to waste. The consumption of iron is from 100 to 120 parts to 100 parts of copper.

No other humid method is carried on anywhere so extensively and successfully as is this by the 25 pyrites companies of Great Britain, as well as by works in Belgium and Germany. The New Jersey Extraction Company, in this country, also uses it. Roasted cupriferous pyrites is undoubtedly the best suited for it, for the peroxide of iron, as shown by Macfarlane, plays an important part in bringing about such exact results. An ore of much above four per cent cannot be advantageously treated, the chlorination being imperfect, and a larger amount of subchloride of copper being formed than there is alkaline chloride in the liquor to dissolve. The large consumption of salt precludes the use of the method where that reagent is expensive. Hence various plans have been proposed, and to a certain extent adopted, to use the waste liquors or their saline contents as solvents, in what are known as regenerative methods.

THE Lake Superior mines produced 3,215 tons of copper in January.

The Wood River Mines.

For some time there has been trouble in the Wood River mines, concerning the wages question, an attempt being made to cut miners wages to below $4 per day. A number of miners were finally arrested for "conspiracy." There are several miners' unions in the camp. Recently the president of one of them made a speech, saying that the miners should be paid $4 per day, or the "streets of Broadford and Bullion would run with blood." A line of armed men was formed. The president of another of the unions, however, stopped any advance, and got the men to discuss the matter. The men at the Queen of the Hills mine quit work and went to the meeting. The miners at the Minnie Moore also quit. The Wood River *Times* says that afterward, on the morning of the 18th, several of the deputy sheriffs guarding the mine quit their job, because of the sheriff's action in stopping the union men from going to the mines, where they would have been hotly received, and bondsmen, representing $20,000 of the full amount, withdrew from Sheriff Furey's official bonds. However, his action was considered wise by many, as it averted an additional debt on the county of $50,000 or $60,000, and saved the lives of 20 or 30 men.

The Governor and General Brisbin arrived that day, and made an examination of the situation, which resulted in the further quieting of the disturbed condition of affairs, and subsequently the replacing of men in the mines. In the meantime the citizens of Bellevue organized a committee of safety to patrol and guard the town at night, and the members of the committee are called by the union men "stranglers," to whom the most opprobrious epithets are applied. A serious collision between the "stranglers," and the union men was at one time threatened in the streets of Bellevue, but the peace officers succeeded after much trouble in restoring quiet.

It is stated now that about 40 of the ring leaders of the union will be arrested, and the prosecution against them be pushed vigorously; also, that the mines are now working nearly full forces, and that work in the mines would probably now continue uninterrupted.

The Wiswell Machine at Work.

In our issue of March 7th we published a description of the Wiswell Pulverizer and Amalgamator, accompanying the same with a cut illustrative of the machine; which, as stated at the time, was being set up at No. 461 Howard street in this city. Last week several runs were made on small quantities of barren rock to test the crushing capacity of the mill; also one run on a lot of 850 pounds of ore, from the Sulphur Creek District, Colusa county, brought in by Capt. Lightner. This is notoriously a refractory ore, carrying nickel, cinnabar, arsenic and other base metals in such large proportions that little has ever as yet been done with it, though known to be rich in gold. From this lot of ore, we are informed, there were extracted 2½ ounces of gold—90 per cent of what fire assay showed it to contain.

This is not the first attempt that has been made in San Francisco to work this Sulphur creek ore. But in all the trials heretofore made, from 50 to 60 per cent of the gold it carried has been lost, or at least escaped in the tailings. Captain Lightner, who has had large experience as a millman and amalgamator, expressed great satisfaction at the results of the trial.

On Wednesday last, further experimenting with the machine was had, with a view to more fully testing its crushing powers. On this occasion the run was made on rock obtained in this vicinity and not supposed to carry much, if any, precious metal. The rapidity with which this material, a hard quartz, was ground to powder, seemed to take the crowd in attendance quite by surprise, notwithstanding it was made up wholly of mill builders, miners and others familiar with the various kinds of crushers. Some of those present, in their admiration of the work done, went so far as to say they believed this machine would at once begin to take the place of stamps, and perhaps supersede them ultimately.

The Wiswell pulverizer and amalgamator will be run every Tuesday and Friday for the accommodation of those who may desire to witness its operations, and at such other times as parties having any considerable lots of ore may wish to have the same worked. For the present such work will be done gratuitously, the owners receiving whatever gold or silver their ore may contain.

Working Gold Ore in Brazil.

The famous St. John Del Rey mine, in Brazil, returned a small profit for the last half year, which has not been the case for the two preceding half years. The yield for the last half year was 12.551 ounces of gold, against 11.457 ounces for the previous six months. For the year before this, the company were losing about $5,000 per month. The net profit on working the Morro Velho mine the last six months was £3582.

It is noticeable that the cost of raising and treating the ore in Brazil—25s 2d per ton—is pretty high. The loss of gold in treatment is, also large, viz., 34 per cent. We can do much better than this in California. The directors are seeking for improvement and greater economy in working. It might be well for them to examine our gold working systems at the best California mines.

Their expenditure last year was, however slightly reduced, and the yield of mineral was improved, otherwise they would have suffered a loss as in the two half-years previous. The quantity of mineral raised during the half-year was 31,039 tons; during the preceding half-year, 32,617 tons. The quantity of mineral stamped during the half-year was 30,070 tons; during the preceding half-year, 31,680 tons. The quantity of killas rejected during the half-year was 702 tons; during the preceding half-year, 1,141 tons. The quantity of sand amalgamated during the half-year was 46,044 cubic feet; during the preceding half-year, 45,128 cubic feet. The average yield of the 30,070 tons of mineral stamped during the half-year was ·407 ozs. troy per ton; for the whole of the preceding year, ·348 ozs. troy per ton. The loss of gold in treatment has been within a fraction of what it was last year—34.50 per cent. Thus, though the proportion of killas rejected during the half-year was considerably less than during the preceding year, the yield had appreciably improved, and that, as the recovery had been the same the improvement was consequently in the quality of the ore quarried.

The average monthly working cost for the six months was £6440. The average for the preceding six months was £6656., and for the corresponding period of last year £7281. The produce of gold from the Cuiaba mine for the last half-year has been 1701 ozs. troy; the produce for the preceding half-year was 1714 ozs. troy. The quantity of mineral stamped, and the recovery of gold therefrom for the half-year was 9667 tons mean, averaging .1776 ozs. troy per ton. The average assay of the mineral stamped during the half-year was ·3516 ozs. troy per ton, so that only one-half the gold contents of the mineral was recovered.

The total working cost on this mine for the six months has been £5026 4s. 2d., and there has been extended further on explorations and watercourses (ordinarily charged to capital account) £956. 1s. 2d., making the total outlay £5982. 5s. 4d. The gold extracted realized on sale in London £6121. 10s. 6d., thereby more than covering the total outlay.

The Nevada Bullion Tax.

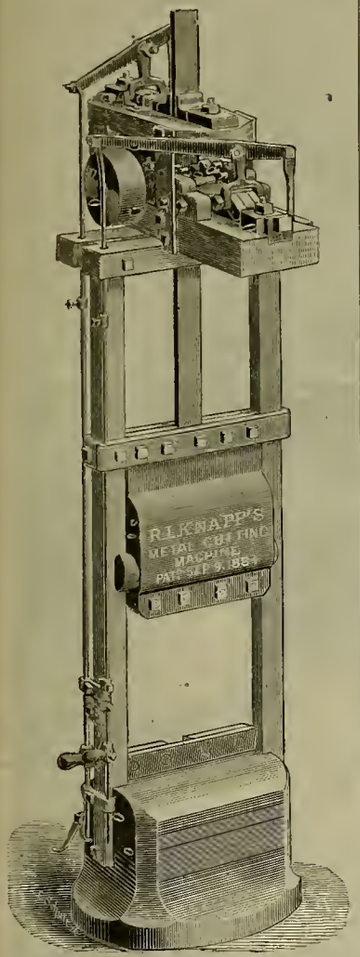
For a number of years Nevada has levied a tax on the gross bullion yield of the mines, without taking into consideration the cost of producing the bullion. The tax has been an onerous one, especially of late, when the product of many of the mines has been small, and there has been little profit. A new law was recently passed by the Legislature, which provides that all ores, tailings and mineral-bearing material of whatever character, shall be assessed for State and county taxation, but it provides a better method than formerly, by taxing net proceeds, as follows: From the gross yield, return or value of all ores, tailings or mineral-bearing material, of whatever character, there shall be deducted the actual cost of extracting said ores or minerals from the mine, the actual cost of saving said tailings, the actual cost of transportation of said ores, mineral or tailings to the place of reduction or sale, and the actual cost of such reduction or sale; and the remainder shall be deemed the net proceeds, and shall be assessed and taxed as provided for in this Act.

New Metal Cutting Machine.

The usual method of cutting steel or iron bars or plates is by means of power or hydraulic shears which operate with a slow motion and under great pressure. Mr. Robert I. Knapp, of Half Moon bay, San Mateo county, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus for this purpose, in which he employs the momentum of a falling or steam driven weight, carrying one of the shear blades so that it passes the other, which is stationary and upon which the plate to be cut may be held.

The engraving on this page represents the new machine as operated by a weight. There is a heavy metal base having one of the shear blades fixed to it. The guide posts are arranged on the weight bits accurately while it slides up or down. In the lower face of this weight is fixed the other blade of the cutting shears. The two blades are so fixed on their respective supports that their cutting edges will pass each other with a shearing action, one end of each being nearer together than the other end.

In order to raise the weight and control the movements, it is provided with a stem which extends up between rollers secured to shafts at the top of the guides. The driving shaft is driven by a belt on the pulley. The shaft of



KNAPP'S METAL CUTTER.

one of the rollers is journaled in a support which may be moved horizontally to or from the other roller-shaft, and this motion causes the rollers to clamp or release the stem to raise or drop it.

In order to move this support, it is fitted into horizontal guides and has one arm of a knee, or toggle-joint, connected with it, while the other arm of the joint is fixed to an adjusting plate or block. The center-pin of the toggle is connected with a lever by a link, and the long arm of the lever has a rod extending down alongside one of the guides, as shown, to a point within easy reach of the operator, while the short arm has its fulcrum in the post.

When the rod is pulled down, the toggle levers are straightened, and the slide or support carries one of the roller shafts closer to the other, until both rollers press upon the stem of the weight with sufficient force to raise the stem, and with it the weight and its blade.

A collar is fixed by a set screw on the rod, and there is an arm or projection on the weight, so when the weight reaches the desired hight it strikes the collar, and the lever is operated so as to relieve the roller from the side of the stem sufficient to let the weight drop. If it is desired to hold the hammer at its highest point, a hinged block is so placed as to allow itself to be turned up as the stem moves up, and when the rollers are relieved from pressure, and the stem begins to drop, the block falls against the stem and binds and holds, a similar block on the other side also pressing against the stem. Suitable mechanism is also employed to withdraw the clamping blocks from the stem to allow it to move freely when it is desired to drop the weight-stem and blade. A bent lever, has its angle fulcrumed in a support, so that one end of the lever stands just beneath the end of the rod, and the other depends to a point near the ground, so that the operator can touch it with the foot and then lift the rod and draw

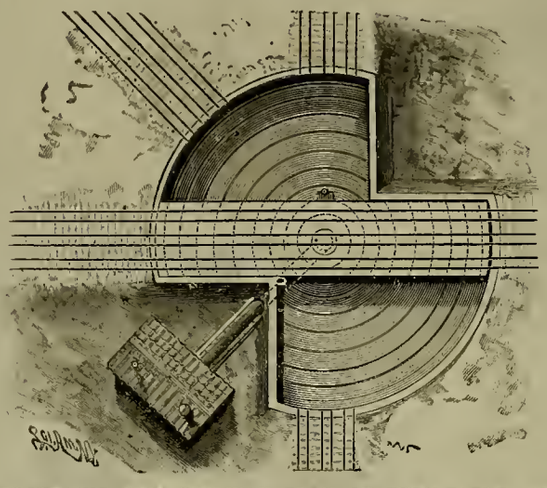


Fig. 2.—INTEROCEANIC SHIP RAILWAY—PLAN OF TURN-TABLE. (See P. 201.)

the block back, when he desires to drop the hammer.

A collar is fixed to the upright rod at such a point that when the blade has descended so as to cut the bar or plate, the arm on the block will strike this collar and force the rod, lever

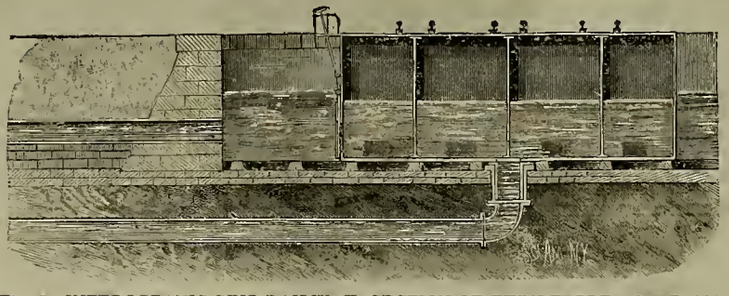

Fig. 3.—INTEROCEANIC SHIP RAILWAY—SECTION OF TURN-TABLE. (See P. 201.)

and center of the knee joint down until the rollers are again pressed against the stem with enough friction to instantly raise the movable shear-blade for another blow. Another collar is fixed on the same rod below the guide, and of such a shape that when the rod is forced down by the dropping of the shear-blade, this collar will strike the end of the pawl and release it from the rack on the other rod. The weight of the rod will then bring it down, and by its action on the lever and toggle will force the block forward so as to again be in contact with the stem, and ready to clamp and hold it when it reaches the top of its stroke.

This machine has been in practical use for the last two years at Mr. Knapp's plow manufactory at Half Moon Bay. He estimates that it will do three times the cutting of ordinary machines. Mr. A. H. Knapp held a watch on them while at work and saw them cut up 275 pounds of ⅜ steel into plowshares in eight minutes.

Mr. Knapp left here a few days since for New Orleans, where he will exhibit one of these machines. He also combines with this a power punch and press, with little additional expense. Mr. Knapp is the inventor of the well-known Knapp side hill plow, the first revolving side-hill plow made on this coast. In making these plows he found the expense of cutting steel so great that he studied out this improved device. This invention will undoubtedly attract attention among iron and steel workers at New Orleans, and reflect credit both on him and his State. He has not only patented the invention in the United States, but is procuring patents in all important foreign countries as well.

Governments and Mines.

Foreign Governments exercise a much closer watch over the details of the mining industry than ours does. In fact ours does very little one way or another. Congress makes laws for the miners and that is about all it does. The mines are worked in any way the owners like, without any restriction. Abroad there are Government inspectors, commissioners, etc., who look after details of work, with a view mainly of compelling proprietors to adopt and carry on systems to prevent accidents to the laboring miners. In some respects this Government surveillance is beneficial, and in others it is irksome. Take France for instance, where they have so many commissioners of all sorts, inspectors, captains, etc., that they must be a nuisance. And the Government there even has among its monopolies that of gun-powder, which operates as a heavy tax on mining. The price of powder is three times greater than in England, and as the state of the coal measures in France necessitates much more blasting than is required in England, the cost of getting coal is thereby considerably enhanced. In these times of prolonged commercial depression, matters like this assume a degree of importance that would not attach to them at other times. When mine-owners are striving to prevent the total disappearance of their now narrow margin for profit by the exercise of a rigorous economy in every direction, this tax is felt with irritating severity. Discontent with the extortionate action of the Government often finds expression, and it seems likely that ere long an agitation will be set on foot to obtain a reduction of the price.

In this country people can buy their powder where they like, and they can experiment with all kinds. Competition among the various companies brings prices down very low, so that only a fair profit is made by the manufacturers. A monopoly of this kind of thing cannot last very long among us. Large profits bring in many competitors, as we have seen by experience on this coast, where for a time powder was sold about at cost.

On the whole, our miners are about as well off in this country as anywhere in the world. The Government lets them alone, which seems the best way after all.

COPPER in Liverpool was selling at £7 10s. below the average of 1884, and £16 below the average of 1883. With such prices many mines must work at a loss.

An Electrical Bullet Explorer.

A new electrical apparatus for accurately locating the position of bullets in the human body, has recently been invented and made by Dr. James B. Williams, at No. 759 Market street, the inventor and maker of the surgical apparatus for removing abnormal growths by electricity, which was described in this paper in September last.

The new "Explorer" is contained in a small mahogany case, and consists of probes, alarms, switches and a generator of the electric current by which the apparatus is operated.

The probes are encased in gum webbing, and are so flexible that they may be *tied into knots* without fear of injury, and they will readily adapt themselves to any path a bullet may make. The ends are of pure gold, upon which the fluids of the body can exert no chemical action, thereby insuring a clean and absolute contact with the ball; while their shape is such that they will readily adapt themselves to either convex, concave, or flat surfaces. Laceration of the tissues by their passage, or of obstruction to their passage by the tissues, is next to impossible.

The indicating mechanism is operated by the current from a "dry" pile, and consists of an alarm which is sounded as soon as the probes come in contact with the ball, and an upright needle which swings through an arc of 150°. The alarm ceases to sound, and the needle returns to its normal position, as soon as the contact between the probe and the ball is broken. Either the alarm or the needle may be used as circumstances may require, both being controlled by ingeniously constructed switches. Both the indicating mechanism and the pile are permanently fastened to the inside of the case; the mechanism is supplied with testing appliances, thereby insuring its perfect operation before the probe is introduced.

The new dry pile which supplies the current is the Doctor's own invention, and has been perfected only after a long series of experiments. It will undoubtedly supersede hundreds of batteries now in use for domestic and other purposes, as it occupies but a very small space, is remarkably cheap, and after being set up can be attended to by a mere novice. The currents from it are very powerful, and as the pile derives its moisture from the atmosphere there is no free liquid, and the elements may be placed in cases of any desired shape. A pile sufficiently powerful to ring bells, light gas, etc., in a large building can be placed in a case measuring not more than 4 in. long, 3 in. wide and ¾ of an inch deep. For portable, medical and other apparatus, as well as numerous other purposes, it is superior to any of the chloride of silver batteries now in use, Skrivanows not excepted. The pile at present used in the "Explorer" consists of 8 plates, each measuring 2x1 inch, and will furnish as strong a current as 6 large gravity cells. Comparative tests of the new pile with standard batteries will soon be made, the results of which will appear in a subsequent issue.

Army surgeons and others who have examined the "Explorer" pronounce it to be perfect and destined to supply a long felt want. Every surgeon is cognizant of the fact that the results of explorations for bullets by the best appliances now in use are all but satisfactory, in many instances amounting to complete failures.

It is but justice to Dr. Williams to state that his electrical inventions have attracted considerable attention in the Eastern States, the articles describing them having been copied from this paper into several of the medical and scientific periodicals published there. He has recently received a communication from the Secretary of the American Institute of Electrical Engineers, informing him that the Council would raise him to the rank of full membership. As far as we are informed, he is the only person on this coast who has been thus complimented. The Institute was founded by Edison, Keith and other prominent electricians of America, and numbers nearly 300 members, the greater portion of whom are but associate members.

A CHABOT has presented Oakland with $4,000 to purchase a transit instrument, chronograph, sidereal clock, mean-time clock, break-circuit chronometer, standard barometer and thermometer and polarizing eye-glass for the observatory which bears his name.

Tintic, Utah.

EDITORS PRESS:—During the calendar year 1884 there has been mined and exported from Tintic mining district an estimated gross valuation of ore approximating $1,532,954.40; 21,808 tons of lead silver smelting ore, 1,282 tons of copper silver and gold smelting ore, 808 tons of milling ore, and 25,000 tons of iron ore. On the lead silver, copper silver and milling ores collectively there is a possible net profit of something near $300,000. As these ores are shipped outside of the district for reduction, the smelters make a possible net profit of $10 per ton, no portion of which ever returns to the district to aid in the development of properties or benefit it in any way. The Utopia of the Rose of Tintic Mining Co. consists simply in the combination of mining properties with reduction works, so that a proportion of this profit, now I may say lost, will be used to aid future operations in mines, not particularly as a fixed investment, but as a working capital, as I term it. The mines are all looking well here in Tintic. James Rohbins, Esq., who has spent about $20,000 on his Mono, just east and parallel to Eureka Hill, has lately opened a fine body of ore high in silver assay. John Beck, Esq., manager of the Bullion Co., began sinking a new double compartment shaft about 100 feet southerly from present hoisting works, at a depth of about 60 feet from the surface. He has encountered a fine ore body, high in silver assay. The Eureka Hill Company has purchased the Red Bird Consolidation property. The Eureka Hill mine, the Red Bird Co. and the Keystone, are under one ownership, of which J. Q. A. Packard is president, Captain John McChrystal, manager (or, as we used to say in the Lake Superior county, mining captain). All are being vigorously worked night and day. Nothing is yet being done at the Mammoth Co. property. Captain G. D. Johnson is working the property of the Con. Julian Law Mining Co., chiefly under leases. Dr. John F. Ely, of Cedar Rapids, Iowa, is president, and Hon. Samuel P. Ely, of Cleveland, Ohio, is treasurer. Other properties are also being worked. The *Tribune* wanted $50 to $60 per column this year, so that we had but little in their New Year's issue. We could not afford it.

Eureka, Tintic, Utah. J. C. CAMERON.

Engineering Notes.

Comparative Strength of Granites.

In his twelfth annual report of the "Geological and Natural History Survey of Minnesota," lately published, Prof. Winchell, the State Geologist, gives a useful article on the comparative strength of the New England and Minnesota granites.

The experiments in question were made under the direction of Gen. Q. A. Gillmore, by Mr. James Cocroft. The tests applied were to determine the crushing strength. The test pieces were two-inch cubes, unpolished. Crushed between steel plates, the average strength of 20 specimens of Minnesota granite was found to be 104,800 pounds, or 26,200 pounds per square inch of surface. Crushed between wooden cushions the average strength was 93,272 pounds, or 23,318 pounds per square inch. The average obtained by Gen. Gillmore, in 1875, for 20 New England granites, was 59,785 pounds, or 14,756 pounds per square inch.

The age of Minnesota granites is known to be archæn; that of the New England granites is not yet definitely known.

The surprising difference in crushing strength between the rocks of the two localities is most noteworthy, and to determine just what the cause may be, a careful investigation of their physical characteristics would probably give instructive results.

The Most Economical Cargo Steamer Yet Built.—Half an ounce of coal does not appear an extravagance of fuel to propel a ton of merchandise a mile, but it is sufficient, says the *Mechanical World*, if used in the most improved and economical method of developing its energy, that is, in boiler and engines of a steam vessel, as proved by the steamship "Burgos," which holds the proud distinction of being the most economical cargo steamer yet constructed. On a recent voyage from Plymouth to China, it is stated she carried a cargo of 2,500 tons. During the first part of distance, viz., from Plymouth to Alexandria, 3,380 miles, the coal consumed amounted to 126 tons, or 282,240 pounds. The consumption per mile would therefore be only 83.05 pounds, for each ton of cargo per mile would be 0.33 of a pound, or about half an ounce. It is quite possible that the wind may have helped to produce this favorable result, but it is astonishing when we consider, that by burning a box of matches, energy is set up equivalent to the amount of work done by a man, carrying a hundred weight for 20 miles at a rate, too, of at least three times faster. In fact, taking the element of time into consideration, a man would have to walk 60 miles to do an equal quantity of work.

A Discouraging Outlook.—The N. Y. *Times*, of February 23d, says: A clear, full statement of what has been done by the Panama Canal Company is given by a thoroughly informed correspondent this morning. The most conspicuous fact is the disparity between the outlay required to complete the canal and the money in the hands of the company. It is within bounds to estimate that 700,000,000 francs are necessary, in addition to 730,000,000 already secured, in order to complete the excavation and pay the current interest charges. The correspondent's conclusion is that at the present rate of construction it will be impossible to finish the canal for years beyond the time fixed for its completion. The problem of providing against the freshets of the Chagres river is one of the most difficult with which the company has to deal. The chances seem very much against the completion of the canal in the lifetime of De Lesseps.

Panama Canal Agitation in 1780.—From Germany it is learned that a curious historical document concerning a Panama canal exists in the archives of Venezuela (which, by the way, is not a "city" as some of the Continental papers say it is), bearing the date of 1780. A canal project, this document records, was broached in the reign of Phillip II, but Flemish engineers surveyed the territory and declared that the obstacles to the undertaking were insurmountable. "Native governers," continues this record, "thereupon pointed out to the king the enormous commercial disadvantages likely to arise in Spain from such an undertaking, in consequence whereof Phillip II issued a rescript which threatened with death any person alluding, by word or writing, to the project.

The Cable System.—The cable system of street car propulsion has received a noteworthy extension during the past year, by the construction of about ten miles of such railway for several of the leading street railway companies in Philadelphia, and which was about ready to be put in operation at the close of 1884. It is in contemplation to considerably extend these lines, and if the plans at present decided on are carried out, there will shortly be no less than 20 miles of cable railway in operation in this city. The system in question is in successful operation in San Francisco, Chicago, Detroit and Kansas City.

Night workmen in New Haven, and more particularly the brakemen and others employed on railroads, are suffering from a new eye disease, attended by inflammation, sharp pains and practical loss of sight. As a rule the disease lasts about ten days and then disappears.

Useful Information.

Antiquity of the Trade Mark.

Editors Press:—Regarding the antiquity of trade mark mentioned in your number of January the 24th, I would like to inform your readers that the earth of Lemnos was sold in bowls as patent medicine, by the priestesses of Ephesus, who marked the same with the seal of Diana, representing a goat. It was a little before the siege of Troy that appeared for the first time the usage of minerals in making medicaments. Monopoly took hold of that trade, and no one could sell any medicine of the kind, without having affixed on it the seal of the prince or priest of the place where such mineral came from. Yours respectfully, D. Bloch.

Randolph, Coos Co., Oregon.

Preservation of Wood.

The decay of wood, when exposed to the action of time and weather, is the result of a sort of fermentation process produced by the action of heat and moisture in the watery and albuminous ingredients of the wood, which gradually converts the sound timber into a rotten mass and renders it useless for any mechanical purpose, this process at the same time being assisted by the boring insects that make their homes within the cells of the decaying wood and live on the nutriment of the juices.

The fence builder is led to believe that a post will last a great length of time if only set opposite in the position from which it grew. A coating of oil and charcoal is supposed to protect the posts that enter the ground till not a man will live to see them rotted. Heating till quite a depth has been converted into charcoal has not prevented the process of decay or kept the insects from eating the cooked food within. A change that will make use of the whole material must meet a process of preparation that will reach the entire depth of the wood. Timber that has been steamed under a pressure of 100 pounds to the square inch must feel the effects of heat in all the liquid ingredients contained within the pores, especially when the pressure is reduced and the vacuum pumps put on.

In the creosote process the timber is confined within a large cylindrical boiler and held under a pressure of steam till it has penetrated the wood and vaporized all the fluids within the pores. The pressure is then removed, even the atmospheric pressure, when the creosote is injected and forced into the wood by raising the pressure as before. The object of every rational treatment is to harden the albumen contained in the fluids within the pores of the wood, and nothing short of a complete change, making a different solution entirely, will ever arrest fermentation and destroy all the germs of animal and vegetable life, and enable the woods to effectually resist the destructive effect of fermentation and insect ravages.—*Boston Journal of Commerce.*

A Satisfactory Experiment—Pumping Molasses.—A large Philadelphia house, which requires for its business a daily supply of some 18,000 gallons of imported molasses, is located a little over a mile from the wharf, whence its daily supply is obtained. That supply has heretofore been maintained by trucks at great expense. Having witnessed the successful use of pipes for delivering oil, this firm resolved to try the experiment for molasses. Accordingly, a three-inch wrought iron pipe was laid, which, in the distance named, has an elevation of twenty-three feet and makes five right-angle bends. The operation is as follows: The hogsheads of molasses are emptied at the wharf into a large iron tank, connected with which is a Blake steam pump. This pump discharges into the three-inch wrought iron pipe before mentioned. The density of the molasses varies with the temperature of the atmosphere, and at times it is necessary to heat it to a temperature of 110 degrees, and in some cases a little water has to be added. The average daily work requires twenty-two double strokes of the pump per minute, delivering 2,000 gallons per hour. The difference between the capacity of the pump at that velocity and the amount of molasses actually delivered is ten per cent, showing that, owing to the density of the molasses, the pump does not fill to its full capacity. The experiment has proven a complete success, and a great saving in cost of transportation.

The largest block of artificial stone ever made in the one just finished and which is to form the foundation for Bartholdi's Statue of Liberty on Bedlos's Island in New York harbor. The stone is made of broken trap rock, sand, American and foreign cement mixed and water. Twenty thousand barrels of cement were used. The mixture for the stone was emptied into the "jacket," or mold, and then the surplus water was squeezed out. The stone rapidly hardened, and will now bear 100 tons to the square foot. It is only expected to bear up five tons to the square foot, but it will grow harder for the next two years. It has the color and gain of coarse gray sandstone. It is sunk 15 feet below the floor of the fort and rises 37 feet above it, has a base 91 feet square, is 67 feet square at the top, and is 52 feet and 10 inches high. On top of this will be erected the granite pedestal from which is to tower in all its magnificent proportions the colossal work of the great French sculptor. The casting of this mammoth monolith evidences the extent of modern progress in a signal way, especially when we imagine how, by this concrete process, Cheops could have so much more easily molded his pyramid, and the Russian Emperor been spared the great undertaking of removing to St. Petersburg the monster rock which supports the equestrian effigy of Peter the Great.

How the Flight of Bullets is Measured.—At a recent meeting of the New York Electrical Society, Mr. Henry A. Sinclair exhibited the instruments used for ascertaining the velocity of a projectile, and practically exhibited the working of the device by a test on the velocity of a pistol ball. Having first read the history of attempts in the past to solve the problem of measuring the velocities of very fast moving objects, such as bullets and shots, Mr. Sinclair set up a machine, and then, taking a Colt's revolver, fired a bullet into one end of a long coffin-shaped box. The little leaden pellet, having cut a fine wire stretched across the muzzle of the weapon, passed with great velocity over the four foot length of the box, and there met and cut another wire stretched in a gauze from across the box end. The cutting of the first-named wire let loose a falling rod, the cutting of the second wire started a pointed bolt, which nicked the falling rod, and then, by a ready measurement, the initial velocity of the bullet was made known. A 130-grain bullet, fired with 3½ grains of powder, gave a velocity of 207 feet per second, while another cartridge, having but 3 grains of powder, gave an initial rate of 156 feet per second.

To Measure the Contents of Cisterns.—A circular cistern 5 feet in diameter, holds for each foot in depth 4½ barrels; 8 feet in diameter, 12 barrels; 9 feet in diameter, 15 barrels; 10 feet in diameter, 18½ barrels. A square cistern, 5x5 feet, holds for each foot in depth 6 barrels; 6x6 feet, but 8½ barrels; 7x7 feet, 11½ barrels; 8x8 feet, 15½ barrels; 9x9 feet, 19½ barrels; 10x10 feet, 23¾ barrels.

To Destroy Vermin, etc.—A preparation made with one pound of soap (soft or hard) with an ounce of carbolic acid crystals dissolved in water will destroy vermin, itch, scurf and mange. The preparation given above should be diluted in warm water before being applied to the animal, and it will then not injure the hair.

Good Health.

Catarrh.

Editors Press:—Please publish a recipe for catarrh in your health columns and oblige a great many of the readers of the Press.—Thos. Haverty, *Telluride, Colorado.*

The above note has been accidentally delayed by being overlooked. We now hasten to answer. Catarrh is a very common complaint. Almost everybody is at times more or less afflicted with it. In many cases it produces no painful symptoms; in others it is attended with much suffering. The first symptoms of the disease becoming of a serious nature is a heaviness and perhaps pain in the base of the forehead. As the disease progresses there is redness of the eyes, dullness of hearing and ringing in the ears, tickling in the throat, and cough, foul breath, and finally decomposition of the facial bones, and loss of taste and smell.

A slight affection of catarrh may be induced by cold. Repeated colds may render it chronic. The seat of the disease is then located in the blood. In a cold or checked perspiration the effete vapors which pass off readily through the skin in health, are thrown back into the blood, cause inflammation and consequsnt decomposition of blood particles, just as a running sore decomposes the animal fiber about it. An outlet for this purulent matter from the blood is most readily found through the mucous membrane of the nose. If the general bodily health is cared for, and colds and exposure avoided, the symptoms will disappear; otherwise the discharge continues and increases until the blood becomes poisoned and the disease chronic.

Treatment—Contrary to the general opinion respecting this disease, it is among the most readily cured maladies, provided the patient can be placed under proper conditions, and can receive proper treatment. Among the necessary conditions, we mention as of the greatest importance, warm clothing, which should be carefully regulated according to the season of the year. As a general rule, flannel should be worn next the skin both summer and winter. The skin must be kept active and vigorous by tepid or cool baths or saline baths. The general health must be improved by a simple but nourishing diet, proper exercise, sufficient sleep, and attention to all matters pertaining to health. It is also of special importance that the diet should be of an unstimulating and unclogging character. Animal food should not be taken too largely, and condiments and rich food should be avoided altogether. The bowels should be kept loose and regular by the abundant use of fruit and coarse grains. The patient should be protected as much as possible from sudden changes of the temperature. This is best accomplished by not keeping too much indoors, but by hardening the skin and accustoming it to daily out-of-door exercise at all seasons of the year.

In addition to the above measures, much can be done toward effecting a cure by the use of proper local applications. When there is an abundant discharge, a cleansing lotion, followed by a lotion of an astringent character, should be used daily by means of the air atomizer. When the discharge is offensive, a disinfecting lotion should be used in addition to the cleansing and astringent lotions. When there is dryness of the membrane and scabs are formed, cleansing and stimulating lotions should be employed.

In all catarrhs, chronic or acute, long or short, a wise physician will do nothing to stop or repress the "flowings" or "runnings," but will use means to cause a greater activity of the liver, and prescribe an unstimulating and cooling diet, warmth and judicious exercise.

For ourselves we would give physic a wide berth. If we had a "flowing from," a catarrh, a cold, all of which mean precisely the same thing in nature and essence, we would let it flow, and thus have the system relieved of an enemy whose presence it will not tolerate. But there are three other things which may be done to very great advantage, because they would expedite the cure.

1. Keep the body very comfortably warm by all available means, especially the feet.

2. Take a good deal of exercise in the open air, to the extent of keeping up a very slight perspiration for several hours during the twenty-four.

3. Live on light, loosening, cooling food. Eat moderately of ordinary food, but partake freely of stewed fruits or ripe fruits.

A good gargle, if any is used, is a solution of salycilate of soda—a teaspoonful of the powder dissolved in a goblet of water.

The Diphtheria Cure Endorsed.

Editors Press:—I feel it my duty to speak of the value of a "cure for diphtheria" published in your paper of Jan. 3, 1885. The cure referred to consists in the use of liquid tar and turpentine burned on live coals.

I have tried it for a violent attack of cold. Two applications effected a cure. Other persons have been cured the same way, in my house. One day a little girl seven years old came in. She had had an attack of fever some weeks before, but still continued feeble, and had more or less fever daily. It was with some difficulty we could prevail on her to stay in the rooms to inhale the smoke. The result is, she has had no more fever, and has entirely recovered.

Another case is that of a 4-months'-old babe. She was attacked with fever, and, soon white patches were seen in her throat. A prompt application of the remedy relieved her immediately.

Now, I consider the information of a remedy of so much practical utility is worth ten years' subscription to the Press, and I wish the value of this simple remedy could be made known more generally. Robert S. Taylor.

Hanford, Cal.

Eat More Vegetables.—The vegetarians have done something in opening the eyes of sensible people, and of their doctors to these enormities of diet, says the London *Times*, and have even shown them that meals may become better and less monotonous by exchanging much of the meat for vegetables. Lentils, peas and all their kindred are almost as nourishing as animal food, and a cook will find plenty of palatable ways of dressing them. Rice, the food of a large fraction of the human race, is not half enough employed by us, except for the benefit of our children. Why is not more use made of maccaroni? No doubt, too, the vegetarians are right in denouncing "the present system of living chiefly on white bread and butter, alcohol, or even teakettle slops," as deteriorating to the constitution of our artisans and country laborers. A real service is done whenever these people can be shown how at no increase of cost they may vary and improve their food; and this the vegetarians can do, if only from their experience of different kinds of vegetable diet. But they must not expect the British artisan to agree with them altogether, though they draw up a frightful list of diseases and disasters to which carnivorous flesh is heir, and though they match this with another list of "leading men, strict vegetarians"—a list beginning with Prof. Newman and John Wesley and ending with "Rossean, Pythagoras, Borromeo."

Danger in Smelling-Salts.—A doctor who ought to know says that the practice of the wholesale use of smelling-salts, which came in with the universal fashion of carrying smelling-bottles, is sure to have its influence upon the olfactory nerves sooner or later, and will render the victim unable to distinguish cologne from assafœtida. More than all that, it causes headache, sore throats and red noses. The last argument will have its weight. The smelling-bottle must go.

Mental Activity and Physical Beauty.—A modern scientist has discovered that mental activity enhances physical beauty, thus controverting an old theory. It says: "A handsome man or woman who does nothing, but lives well, or self-indulgently, grows flabby, and all the fine lines of the features are lost; but the hard thinker has an admirable sculptor always at work keeping his fine lines in repair, and constantly going over his face to improve the original design."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO.—Cor. Amador *Ledger*, March 21: Mr. Hopkins, one of the principal owners in the Acme mine, was up here on last Saturday, and is thinking about starting up the mine at the commencement of spring. Rock from three different parts of the mine was taken to San Francisco, and assayed respectively $140, $110 and $22 per ton. This appears to encourage the owners. The Gillick mine, located on Sutter creek about one mile below town, is considered by all mining experts to be the biggest kind of a bonanza. The mine consists of two parallel ledges about 40 ft apart, and each ledge is 3 ft in width. The mill owned by Mr. Gillick, situated on the opposite side of the creek, is at present undergoing repairs, and we understand the wheel will be finished at the beginning of next month, when a crushing will be immediately made. R. C. Downs and wife of Sutter Creek were in town on last Saturday. We understand that he intends to start up his mine in the beginning of spring. The St. Louis mine owned by Reed & Smith, and located at Irishtown, had a crushing one day last week and the rock paid on an average $16 per ton. A tunnel runs into the hill about 200 ft, at the end of which a shaft has been sunk to the depth of 150 ft, the rock taken from this shaft paid $22 per ton. There is also at the mouth of the tunnel another shaft, and the rock from this place paid over $25 per ton.

GOOD ROCK.—Amador *Sentinel*, March 21: Good rock is shown as coming from Stewart's Ligbthouse mine. The prospects appear very favorable here for a permanent mine. Charley Mitchell of Sutter is confident that he has the boss mine. We hope he has. It is situated just across the river in Calaveras county and is upon the main lead. There is continued good news from the Mammoth tunnel. They have now a hard, well-defined ledge of a good character of rock. The depth is 700 or 800 ft, and would indicate a large ore body in the river region. Messrs. Moon & McConnell have disposed of an interest in their mine, between the town and the river to John Steinberger, the latter to have the management of the working of the same. Mr. Steinberger can put money into the development of the property and it is presumed that he will do so. The St. Julian stamp continues pounding away, and does good work in helping to pay the expenses of prospecting the mine. The owners are talking of erecting a 5 or 10-stamp mill upon the property, it being possible to run a mill of that description almost as cheaply as the one they now have.

SUTTER CREEK.—There is talk about forming a partnership between some of the idle men about town and the Mahoney Mining Co. to work the mine, the company to furnish the material and the men the labor, the profits to be shared equally. This is the rumor; how it will turn out we shall have to wait and see. John A. Steinberger, one of the principal owners of the Amador Consolidated, was up last week for a few days looking after the mine; he left Thursday morning for Mexico, where he has charge of a coal mine. Dick Eden and Jack Truan are prospecting their claim, on which they have a sbaft 45 ft deep, with some very good looking rock carrying a large amount of sulphurets. The McIntyre mine is at a standstill, but will start up the first of May, when new machinery, consisting of an engine and hoisting works, will be set up, and the indications are that Mr. McIntyre will have a good paying mine before long.

A NEW QUARTZ MILL.—*Dispatch*, March 21: We are informed that Messrs. Morgan & Shugert, of the Amador Queen mine, will commence shipping up the necessary machinery in a few days for erecting a new 20-stamp quartz mill on their mine. They have been prospecting this mine for some time, and are now thoroughly satisfied that it will pay them to work it on a large scale. There is every indication now that it will prove to be a big paying institution.

Calaveras.

BIG MILL PROJECT.—*Mountain Echo*, March 21: It is reported—with how much truth we are not prepared to say—that a hundred stamp mill is to be erected on the Gold Cliff mine. The most incredulous man in the county can no longer doubt the permanency of the mining boom in this vicinity. We are informed that one day last week, a miner who was prospecting in a gulch near Duck Bar, on the Stanislaus river, found a piece of gold weighing a fraction over $80. A gentleman called at our office the other day and exhibited some exceedingly rich specimens of quartz which he said were extracted from a mine near French gulch, this county.

CAVE.—Calaveras *Chronicle*, March 21: A cave occurred in the Penobscot hydraulic mine, on Tunnel Ridge, the other day. The cave was not extensive, but the bank being very high the debris scattered considerably and the wind caused by the falling mass was powerful. Eight Chinamen were knocked down while beating a precipitate retreat, but no one was badly hurt.

Del Norte.

QUARTZ.—Del Norte *Record*, March 19: From all appearances it now seems that the several quartz mines in this immediate neighborhood are destined to amount to something in the near future. The quartz in which these mines abound is known to contain the precious metal in a reasonably fair proportion, and their position being of such easy access it is a thing to be wondered at that they have till now failed to attract foreign capital to bring about their fuller development. A company composed of Eastern men have the agency for Wiswell's Improved ore pulverizer and amalgamator combined (one of which machines is now on exhibition in San Francisco) has at last interested itself in one of these mines, and says that if the quartz will produce gold in an amount not less than three dollars a ton the company will have the necessary machinery on the ground inside of 60 days to vigorously carry on the works. The mine to which we refer is situated about a mile and a half east of the Bald Hills quartz mine, and is now and has been owned and prospected by Messrs. Dave Gordon and Jose Teran. These gentlemen were to bring in this week something over a thousand pounds of ore to be shipped below on the next steamer for the purpose of having it tested. They feel confident the ore will go far above three dollars a ton. They prospected the lode sufficiently last summer to satisfy them that there is an almost unlimited supply of ore, and that it can be placed on the surface at a cost not exceeding 50 cents a ton. In the absence of water facilties to run the machine an engine will here be used sbould the product of this thousand pounds of ore demonstrate to the satisfaction of the company the feasibility of putting up the works. We look with no small interest upon the test.

El Dorado.

GOOD FIND.—*Mountain Democrat*, March 19: In speaking with some gentlemen from Shingle Springs about "finds" in course gold, we were told that something like a month ago, M. S. Grainger of that place had picked up a piece weighing $1,515. This nugget was found near the surface on Mr. Granger's ranch. He had previously found pieces weighing from $100 to $300 in the same vicinity.

OLD HICKERY MINE.— — Ball, of Oakland, has been in Placerville the past week looking after his interests. He has concluded to resume work on the Old Hickery mine north of town, and prospect it to a greater depth. Mr. Ball says he intends to know what this mine is good for.

HENRY'S DIGGINGS.—Bradley has completed the work on the flume and ditch, and the water was turned in March 16th. The boys are all getting ready to work up their pay dirt. W. T. Armstrong has discovered and located a fine quartz ledge which prospects well.

Inyo.

MODOC CON.—Inyo *Independent*, March 19: Started drift from bottom of winze on the 10th. Southwest drift shows a strong ledge with occasional bunches of ore. Northwest drift shows from two and a half to three feet of clean ore. Amount of ore at the furnace and on the dumps, 134,000 pounds. The ore now being extracted will smelt without flux of any kind.

PROSPECTING.—Freeman and Coates are prospecting on their claim west of Bishop creek. They have no men employed and do not want any. No other prospecting is being done in this locality. Not enough work has yet been done to enable any one to determine what the value of the late discovery may be, nor even to prove if the ore will pay for working. Of course every one in Inyo county hopes Messrs. Freeman and Coates may find millions in it.

CASEY MINE.—At the Casey mine there is a very large quantity of ore in sight; at present Mr. Cook has but four men at work, but enough has been developed in the mine to determine the company to build a mill. On ground belonging to the company there is a vast quantity of low-grade ore that will go at least $20 per ton. A way will be found for working this ore.

BROCKMAN MINE.—There is reported to be a large quantity of ore in sight in the Brockman mine, north of Bishop creek, that contains 30 to 60 per cent copper and from $100 to $500 per ton in silver.

Mariposa.

SULPHURETS.—Mariposa *Gazette*, March 21: The ores in the Eureka mine at Hornitos, Mariposa county were thoroughly tested in 1883 by S. E. Holcomb and found to be a sulphuret proposition, and recommended the mine as such to Eastern capitalists. From this standpoint, Eastern investors have purchased this property and have erected thereon a new 10-stamp mill which will be in running order in a few days with all modern improvements to save sulphuret ores, which in early California mining were considered worthless, particularly in this county.

THE GRANT MINES.—There are scores of mines in this county with an unlimited quantity of rock that will pay over $13 per ton, with every facility for cheap working, but capitalists do not appear to want them. When the mines on the Grant are worked, however, the attention of mining men will be attracted towards Mariposa, and then our prospectors and mine owners will have a chance to either sell their claims or induce others to advance money with which to work them. Now that Donahue & Kelly have a perfect title to the Grant the working of it is only a matter of a little time, as those gentlemen are not the kind of business men to keep such a large property idle for the privilege of paying taxes on it. They desire to sell it, we are informed, as they know nothing of mining, and it ought not to be a hard matter to do when we consider the large number of developed mines on the property.

Modoc.

HAYDEN HILL.—Cor. Adin *Argus*, March 19: The Juniper arastras are to start up to-day, though it will be some time before the quartz mills will begin to grind. The "Golden Eagle" is still taking out ore on the east levels, and running a prospecting drift north in heretofore unprospected grounds. Billy McDonell is expected to arrive here in the near future and resume work on the "Don't Care" mine. The Harbet mine has suspended work for the present. The "Brush Hill" now owned and worked by Beckman & Vanderelst, is still producing considerable good ore. Jerry Rose has leased a portion of the "Golden Eagle" and is tunneling near the "Providence" line.

Mono.

OLD MAMMOTH DISTRICT.—Bodie *Free Press*, The Lisbon mine is opened by three tunnels, one 50 ft from the apex of ledge which runs northerly and southerly. Second tunnel 100 ft lower than the first and the third 100 ft still lower. Winze connects Nos. 1 and 2. Another winze is being sunk to the third tunnel and is now over 60 ft deep. Good ledge exposed in all averaging from 2 to 3½ ft. Free gold bearing quartz. They are now prepared to take out rock for a new 5-stamp mill to be erected the coming summer. Have already made some successful runs in arastras. Alpha tunnel shows good spots of ore. Chas. Albright is working the Foulk mine which makes a fine showing and some good ore on dump. Plenty of base ore of low grade in the district. Seven men wintered in the camp. From the Punch Bowl, 6 miles from Williams' ranch, snow continues to Mammoth, the average depth of which is about 3 ft. No sign of animal life anywhere. Snow ceases at Casa Diablo springs and Long Valley to the southward is clear as far as the eye can reach. Teams from Bishop Creek can get within 3 miles of Mammoth. Not a soul to be seen in the old town of Mammoth. Houses overthrown by wind, tables, chairs, beds, etc., in wild confusion. Roofs breaking and broken down under weight of snow; clanging doors and shattered windows showing the deserted interiors. The once lively streets are filled with broken odds and ends incident to a hasty departure. The old Mammoth mill battery and pan room has caved in upon the machinery. Office, stables, boarding houses are in good condition. An immense lot of wood lies piled at the foot of the tramway and mill. Mineral Park and Pine City present the same appearance as described above. The snow is from 4 to 5 ft deep, and on the big lake is 3 ft with 4 ft of ice. Boats of all kinds lie half buried on the banks. The west side of Mammoth hill is free from snow about two-thirds of the distance from the summit down.

A NEW DISCOVERY NEAR MONO LAKE.—Bodie *Free Press*, March 21: The Olsen mine, located and prospected by Uncle Dan Olsen, is a recent discovery which gives promise of a mine of considerable importance. It is situated in Jordan district on the northwest side of Callihan's canyon and about three miles from Mono Lake. Mr. Olsen has run a tunnel 75 ft in a westerly direction, the face of which is about 100 ft from the surface. There is a cross drift 25 ft—no walls. The formation is black clay and quartz carrying gold and silver with assays as high as $500 per ton and bears a close resemblance to the old Gold Hill diggings in early days. About 300 ft above the mouth of the tunnel the cropping is from 6 to 10 ft running in an easterly and westerly direction. Several other parties are prospecting in the neighborhood with good success thus far.

Nevada.

WASHINGTON DISTRICT.—Cor. Nevada *Transcript*, March 21: The Washington mining district is proving equal to the expectations of the most sanguine, and it is now generally conceded to be one of the richest gold-bearing sections in the State. The general average of the rock will work by mill process, from $8 to $20 per ton, which with the strength and number of the veins is a sure indication of the wealth of the district. In all cases the ore has steadily increased in value as depth has been attained and the opinion largely prevails among men of acknowledged capacity in this branch of industry, that owing to the continuity of the ledges and the extreme width of the mineral belt there will eventually be as deep mining in this district as in any other part of the State. During the past few days I personally visited nearly if not quite all of the mines, both developed and undeveloped, within certain boundaries in this district. The first mine I visited was the IXL, located at the head of Diamond creek. Their ledge is small, but well defined, as gold could be seen in almost every piece of rock taken from the dump. The company have a number one five-stamp mill running steadily, with all the improvements for saving the gold, sulphurets, etc. John Deardoff is their present superintendent. The old Last Chance mine, considered to be one of the richest in the district, lies just to the north of the IXL, and at present is idle, though work is expected to be started up on it some time this summer. This property belongs to Messrs. Webber and Haggin of San Francisco, owners of the Yuba mine. At the Cornucopia and Secret Treasure they are working night and day sinking their shaft. They have it now down about 70 feet, carrying a four-foot vein of good character rock, as gold can be freely seen in many pieces taken from the dump pile. Their new mill is not running at present, but it is not for the want of ore to work as they have in the mill and on the dumps from 100 to 200 tons ready for crushing. At the Yuba mine, 700 feet south from the mill, they are down 200 feet. That is their lowest level. At that point they have a 12-foot vein, and a large portion of the rock shows well in free gold and galena. Mr. Webber informs me that the mine never looked as well as at the present time. An additional ten stamps is to be added to the mill as soon as it can be done conveniently, making 25 in all. At the Eagle Bird, on the 200-foot level the ledge is from 15 to 18 feet wide and all good paying ore, and a good deal of it shows rich in free gold. It is said that 20 more stamps will be added to the mill during the summer, making 40 in all. The Waters mine is located about 1,000 feet above the Eagle Bird. It has a tunnel in on the ledge about 300 feet, carrying a vein of from three to four feet thick which shows well in sulphurets and free gold. Mr. Waters has out about 150 tons, which will average at the lowest calculation $8 per ton. A Huntington mill with a capacity of from 12 to 14 tons per day is to be erected immediately on the mine. All of the material for building is now on the ground, with the exception of the machinery and the mill itself, and the groundwork is being prepared as fast as workmen can be found to do it. At the Lindsay mine, the oldest in the district, they have now at their upper works a vein about six feet wide and all good rock.

NEW DRIFTING MINING ENTERPRISE.—Nevada *Transcript*: R. P. Denoon, formerly superintendent of the Derbec drift mine, arrived here night before last from San Francisco and yesterday morning left for North Bloomfield. He has leased a large tract of gravel at the latter town and will at once begin working the same by the drifting process. A comparatively small number of men will be employed at first, but the force will be increased as fast as the ground is opened and the circumstances permit. This enterprise may develop into a very extensive one, and if it does it will be a great thing for North Bloomfield and vicinity, as employment will be given to many men who have been idle since the suspension of hydraulic mining at that point.

Placer.

WORK AT HOTALING.—Placer *Argus*, March 21: During the past winter prospecting and mining have been steadily prosecuted at the California Iron and Steel Co.'s works at Hotaling, resulting in the discovery and opening up of what bids fair to be the most important body of ore yet uncovered in this State. At the present workings a shaft has been sunk 50 feet through solid ore, which was still in ore when sinking was stopped and drifting and crosscutting commenced. At present writing the two drifts are in fine ore, one having passed through 35 feet of high-grade ore, assays from which show 68 per cent iron. Ore is being hoisted as rapidly as possible with a view of starting a prolonged blast as soon as raw material is accumulated sufficient to run the furnace for a year.

FOREST HILL.—Placer *Argus*, March 19: The dry weather continues and ditches are getting lower, so that water consumers look somewhat dejected at the prospect of a short season for mining. It is reported that rich gravel has been struck at the Mayflower mine. Everybody here sincerely hopes the report is true, as it may be the cause of other mines being developed on the Divide. The company is in want of several good drift miners.

San Bernardino.

CALICO NOTES.—*Print*, March 22: The Sue mine is taking out 7 or 8 tons of good ore daily and hauling it to the Waterman mill. We were informed that a rich deposit of ore was recently struck in the lower workings of the mine. The little mill at Alvord is to be enlarged to a 5-stamp. The machinery has arrived and was loaded on large freight wagons yesterday. The sampling works are not receiving ore in as large quantities and as regularly as was at first anticipated. Recently 70 tons of ore were milled by the Waterman mill with most satisfactory results. Twenty or thirty men have recently been employed on the Garfield and Occidental mines which makes the present force about 45 or 50. A great many chloriders and unemployed miners have left Calico district recently to prospect in the eastern and northeastern part of the county. The other day we were shown, by Wm. Robinson, some good looking base ore from the new mines about 10 miles from Soda Lake, that assays over 100 ounces to the ton. Mr. Robinson will go out there shortly to see if the ore exists in paying quantities, and corroborates the statements of parties prospecting in that locality. There are about 3,000 tons of second-class ore from the Garfield and Occidental mines ready to be reduced at Barber's mill. About 62 tons have just been reduced at this mill from the Humbug mine, the returns being satisfactory. Also 62 tons from the Golconda are waiting to be milled.

PROVIDENCE MINES.—Cor. Calico *Print*, March 22: In my last I intimated that the Bonanza King mine would likely start up soon again as a $3 per diem camp. My predictions have been fully justified. The mine started up last Sunday with 15 miners and at date of writing there are 30 working in the mine, miners are put on as fast as they arrive and it is likely the Bonanza King Co. alone will work 85 to 100 men. The mine is said to look better than ever before, at any rate your correspondent saw as good ore, piled up on the dumps to-day as it bas had since the commencement of the working of the mine. The owners of the mine claim to have cut the miners wages with reluctance, but owing to the very low prices of bullion they were compelled to do so. It is quite evident that it is their intention to push the working of the mines more than ever before. The mill will likely start up again whenever the mine will have sufficient ore ahead. The president and some of the principal owners have been here for the past week, and everything is being arranged for the more complete development of the Bonanza King Consolidated Mining Co's. properties. You may confidently expect to see a larger output of bullion than ever before. The Kerr, Belle McGillroy and Mozart group of mines are all being worked and they are all showing good ore bodies. It was stated on good authority to-day, that the Belle McGillroy and Mozart group of mines have been bonded to a Pennsylvania Syndicate represented here by Mr. A. G. Hoyt a nephew of ex-Governor Hoyt of that State. Miners wages are $3 per day, and board $7 per week.

Shasta.

GOLD AND SILVER.—Shasta County *Democrat*, March 18: Dale & Fife of the Silver King mine are getting ready to commence shipping ore. Dan O'Neal has struck another rich body of ore in the Florida and is now putting it through his new arastra. We are told that fully 100 men are prospecting in the mountain range between Iron mountain and the Sacramento river. F. B. Simonds Sr. is up on Backbone prospecting. He has found two claims that prospect first rate in free gold. Tom Green was in town Monday and deposited with the bank a chunk of gold bullion weighing 7½ pounds. This is one of Tom's little cleanups. Our local capitalists are over looking the best-paying investments that are open to practical business men of the county in our rich and undeveloped mines. Development is all that our mines need to yield thousands. Tucker & Keifer, who are sinking on the Monarch near the Silver King were compelled last week at a depth of 20 ft to stop work for a few days on account of too much water. They will resume work as soon as they can put in a steam pump. Mr. D. McCarty, section boss, has struck what appears to be a big silver ledge on the west side of the river near the mouth of Spring creek. We have seen samples of the ore that look splendid and closely resemble the rich ore of the Silver King. Kempton of Salt creek for several days has been running his cannon-ball mill on ore hauled from the Fair View mine, situated on the ridge west of the old Hall reservoir. Ore from this mine already crushed has averaged over $100 per ton. Lowrey & Brincard are finding good ore in the shaft they are sinking on the Silver Queen, the first extension north of the Silver King. About two weeks ago O. P. Whitton and Bob Small struck a fine free gold-bearing quartz ledge on the mountain between Squaw creek and Backbone, about a mile and a half from Jack Coonant's rich ledge. It appears to be an extension of the same vein much higher on the mountain. We are reliably informed that 800 feet of the croppings show free gold and prospect big. The shaft on the Pioneer mine, on the Silver King lead, is now down about 20 ft, at which depth fine looking ore was struck. The vein proper is 4 ft wide and dips about 30 degrees east. The owners of this mine feel sanguine that it will develop as good property as the Silver King. Water will soon compel them to put in a pump. From the many samples of gold and silver ores that are daily brought to this office, judging from their character and the formation they are in, we can't help feeling confident that good work will this summer develop a number of splendid mines within a radius of from 10 to 20 miles of Redding. It is hardly possible that all these fine prospects will fail; some of them must turn out to be good property. Every day brings something new that is very encouraging.

TO BE WORKED.—Shasta *Courier*, March 21: The owners of the once renowned, and rich mine known as the Bunker Hill mine, near the Middle Creek depot, are making extensive arrangements to have it thoroughly worked again, and already have a force of men at work. It is to be hoped it will pay as rich as it did 20 years ago when gold was taken out by the bucketful.

Sierra

NEW QUARTZ MILL.—*Mountain-Messenger*, March 21: Supervisor A. C. Busch, P. Deidesheimer,

and the other owners of the Young America quartz mine, located about four miles above Sierra City, have decided to erect a ten-stamp mill upon the property this summer. They have spent the past year in thoroughly developing the ledge, and now have a strong vein exposed for a distance of 300 feet in the lower tunnel, with a backing of 150 feet below the tunnel next above, showing quartz enough to run a ten-stamp mill for more than a year. A tunnel still lower has been started. Samples of the rock we have seen are very rich, and the whole ledge wherever it has been exposed, shows a fine quality of ore, with a uniform prospect such as is seldom seen. The iron-work of the new mill will be furnished by Taylor & Forbes of the Downieville foundry. The stamps for the mill will weigh 750 pounds, and the frame work will be so planned that more stamps can be put in as required. The motive power will be water, of which there is a sufficient supply, and a Pelton wheel.

GOOD SHOWING.—During the past three weeks the Bald Mountain Co., Forest City, have cleaned up 224. 189 and 247¾—660¾ ounces; and the Bald Mt. Extension, 50. 87, 120½—257 ounces, a total of 918¼ or about $17,079.45. an average yield per week of $5 693.15. Who says Forest City is on the decline can't be posted well in the underground workings of her mines. There is enough good-paying quartz in sight at the ledge of Jerome York to last about a year. It costs $1.50 to mine and $1 per ton to mill the ore, leaving a fair margin for profit. The lower tunnel of Gold Bluff is now in over 900 feet and has to be run only about 600 feet further to be under the upper workings. It is thought the ledge will be reached at the farthest by July, and perhaps before. Two shifts are at work and the rock is good.

Siskiyou.

PICK AND PAN.—Yreka *Union*, March 21: The Boulder creek quartz mill is idle, and has been attached for debts. As soon as litigation ceases it will no doubt be started. The rich Bonanza mine on Indian creek has been bonded by local capitalists. Terms unknown. Four years ago the owners refused $60,000 for the property. Several mining experts from below are in the county. We told you all the time we had 'em, and rich and permanent ones at that. Our mines will compare with any in the State. Mr. A. H. Denney has bonded the Fortune mine at Callahan and will soon start the pumps at work. The Fortune adjoins the Montezuma on the south branch of Scott river, and is excellent property. The cost of placing and operating the electric lights in William McConnell's Klamath river claim last year did not cost within $600 of the amount expended for pitch-wood the year previous. Those who are lighting their claims with pitch fires should study economy.

SAWYER'S BAR.—From Mr. J. J. Curran, who arrived Monday from Sawyer's Bar, we learn that the miners on Salmon are complaining of the scarcity of water, and that hydraulic miners are all idle. At the Uncle Sam mine they have taken out some very rich rock, but there is no water to crush it with. The Russian Company who own the Red Hill claim, are digging a ditch from the Little North Fork, a distance of 2 miles, to bring water on to the claim. A short time since they took out 27 ounces in one week, Chris. Barry & Co. are ground-sluicing, but have not bottomed up as yet. The Gus Mohr claim will be drifted this season. Mr. Hickey is waiting for water to commence operations in his hydraulic mine. Klein & Bigelow are cleaning out their ditches preparatory to commencing operations in the river. At the Klamath mine they are taking rich rock, and the cleanup this month is expected to be fullly up to that of last. At the Black Bear they are waiting for the arrival of Mr. Daggett, when it is expect that active operations will be commenced. Mr. Jas. Kean, at Evening Star, is crushing rock, but no cleanup has as yet been made, and no estimate can be made as to the final result.

Trinity.

PROVING GOOD.—Trinity *Journal*, March 21: The ledge recently found on Mule creek, near Minersville, by Lupee and O'Shea, and in which others are interested, has every indication of proving to be way-up. A shaft has been sunk on it to a depth of 20 feet, and the ledge at this depth has widened to three feet, the ore showing free gold. "After All" is the name given the mine.

Tuolumne.

POCKET.—Tuolumne *Independent*: John Morris and Mike Page and brother have been unloading a rich pocket in the old Bauli claim, at Brown's Flat. Page is working the claim on shares for Morris who was taken sick at the time of the strike. One piece of quartz was believed to contain $500 worth of gold. It is estimated that they have taken out near $5,000, with more in sight. Rumor has it, that Messrs. Shine and Oliver took 90 pounds of gold ($18,000) to the city, last week, being half of the yield of the pocket struck by them, recently, at Brown's Flat. We learn that the Chrystaline quartz mine, near Jamestown, is proving immensely rich. A little over two weeks ago a great strike was made. Report says that over $100,000 is in sight, and that the chute is so rich that a pick cannot be struck into the rock without striking gold. The mine is on the Mother lode, between the Alabama and Harris mines.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, March 21: Work is being pushed at the above mine, and the managers intend to find an ore body if there is one to be found. On the 2900 level the north drift has been advanced 40 feet during the past week. On the 3000 they are driving a north lateral, just skimming the ledge, and are in a fine, heavy clay formation. They will cross-cut after advancing further.

OPHIR.—On the 500 level have been engaged in cutting a drain and retimbering. The drift which is being run north from the west drift on this level is a joint Mexican and Union Con. drift.

OVERMAN.—Two shifts have been put to work in the Overman mine. The old Lambert tunnel has been cleaned out, and will be driven in to strike the croppings on a level with the railroad track.

CROWN POINT AND BELCHER.—At the Belcher and Crown Point the usual amount of low grade ore is being extracted from the old upper levels and sent to the Carson river mills.

C. AND C. SHAFT.—Ore is being extracted from the 1200 level under the Jones contract, and is shipped to the Eureka mill.

SAVAGE.—Nothing of importance is being done in the Savage, but they are waiting for the result in Norcross.

GOULD AND CURRY.—The usual work is being done, but nothing of importance has occurred during the week.

CHOLLAR.—They are running a drift in west on the 2800 level, and are in good looking ground.

Bernice District.

DEVELOPING.—Cor. Reno *Gazette*, March 16: Mr. Williams, superintendent of the Golden Crown mine and mill, started for Lovelock this morning with nine bars of fine bullion of the value of $10,320, the result of 25 days working of the mill on ores from the Golden Crown mine. The Williams, or lower tunnel, has been run 110 feet during the past month, and on this level was found the best body of ore that has yet been found in this district, some of the ore assaying $1,900 to the ton. The ore on the lower levels has become slightly base and requires five hours' roasting, but the increase in the cost of roasting over free milling is richly compensated for in the increase in the value of the ore. Wood is delivered at the mill for $4 per cord and salt for $10 per ton. A winze has been started in the lower tunnel to connect with a tunnel that is to cut the ledge at 500 feet in depth. The bullion has averaged so far over 900 fine. On the Wild Goose mine four men are at work taking out ore; 175 tons of ore worked at the mill from this mine, yielded $130 per ton. M. W. Hart is at work taking out ore on the Silver Ridge mine. The Mine is looking well and its ores work about $125 per ton. This district needs a ten-stamp mill, as Williams cannot offer any inducements to work outside ores, there being more profit to him in working his own ores, and he has plenty in sight to run the mill steadily. Arrangements are being made to erect a ten-stamp mill this summer, which will materially assist in the shipment of bullion from this district, and the outlook is good for a prosperous camp here for years to come. In Granite district, four miles south of here, D. L. Healy has sold his half interest in the Silver Wave mine to Mr. Hoofer, a merchant from Austin, for $2,000, and I understand that they intend to put on a small force of men. As soon as the weather gets a little warmer there will be considerable prospecting done, as nearly all that have tried their hand have succeeded in getting good results.

Columbus District.

MOUNT DIABLO.—*True Fissure*, March 22: The west drift on the sixth level is in 179 ft, and the north crosscut from this drift is in 15 ft. The stope above the west drift on the fifth level shows a wide ledge formation and is yielding considerable $55 ore. The west drift, between the fourth and fifth levels above this stope, shows 18 inches of $80 ore, A little ore of good grade is being taken from the west drift on the third level. The intermediate, between the third and fourth levels and east of the shaft, is giving a little ore of fine grade. The intermediate, east of the shaft between the second and third levels, shows a small streak of rich ore. The stope west of the shaft between these levels, does not look so well but is giving some ore of fair grade. A little ore is being taken from seve al places on the second level, also from the first level, and from the intermediates between the first and second levels. A bullion shipment of $10,591.43 was made on the 15th instant.

Eureka District.

PRODUCING PROPERTIES.—*Sentinel*, March 21: There has been little or no change in the mining situation in Eureka district during the past week. Some 80 men are working in the Eureka Con. mine, and ore is being extracted from the second, fourth, seventh, eighth and twelfth levels. Altogether, the mine is looking and producing well. During the past five days 259 tons of ore have been shipped to the company's reduction works. It is the general belief that more miners will find employment in the property just as soon as the new reduction works are completed and operations begun. As it is now the bins are glutted with ore, and to extract more than at present would only incur extra handling and unnecessary expense. The furnace is expected from San Francisco during the coming week, and Supt. Robbins will probably have it in full blast within a fortnight after its arrival. Many of the smaller mining properties of the district are looking and yielding well. The fact that more custom ores are being shipped to the Eureka Con. and Richmond furnaces than ever before speaks well. This is owing to many who have for years been waiting for capitalists to come in and purchase their properties going to work on their own account. In several cases the merits of properties are exceeding the anticipations of their owners. On Adams Hill are several mines from which good ore is being extracted at a depth of 30 and 40 ft. What there is at greater depth is hard to forecast, but inasmuch as the character of that section is somewhat similar, geologically, to that of Ruby Hill, whereon are the famous Richmond and Eureka properties, it is safe to predict a steady yield from there for many years to come. The Silver Lick is located there, and from it good ore is being extracted. The leasers of it have shipped during the past six days to the Richmond furnaces for reduction 56 tons. The Silver West, also located there, sent during the same time to the same works 17 tons. The Lone Pine made a shipment of 9 tons, and the Bowman shipped 7 tons to the Eureka Con. furnaces. The Lord Byron on Prospect mountain continues its output of ore, which works well. During the last week the company shipped to the Richmond works 47 tons. The Maryland mine of Silverado made a shipment of 4¼ tons, and 9 tons, which will work up the in hundreds, were brought in from the Reveille district yesterday. The Silver Connor mine is also among the producing properties, and yesterday a good-sized load of ore was taken to the Eureka Con. furnaces. The Albion also made a shipment Thursday to the Eureka Con. furnaces of 8 tons.

ARIZONA.

THE OLD DOMINION CO.—*Silver Belt*, March 20: On the first of this week our community was greatly surprised at the announcement of the suspension of the firm of Pope, Cole & Co., of Baltimore, the financial agents of the Old Dominion Copper Co., whose works are in this place. The firm was known to be strong and the wonder was how a house of its commercial standing could be forced to suspend, but this is easily accounted for by the large quantities of metal which they had to carry, and were unable to immediately realize from by reason of a glutted and falling market. The firm, we learn, will pay dollar for dollar and have a handsome surplus, but what more nearly concerns this mining district is a question of payment of last months' indebtedness, for which checks were given, and as is customary, were cashed by several of our merchants. Some of these checks have already been paid and Supt. Trippel is assured by telegrams that all obligations will be speedily met, and that a special agent of the assignee of Pope, Cole & Co., now on his way to Globe, will pay all indebtedness of the company not otherwise provided for. In order to reduce expenses, some of the development work in the mine may be temporarily suspended, but the ordinary work of mining and smelting will continue.

COLORADO.

GENERAL NOTES.—Georgetown *Courier*, March 19: The Corry City mine shipped 15 tons of ore last Monday. The Colorado Central mine paid a dividend last Monday. The Daniel Peters is producing 457-ounce ore. Second-class 134 ounces. The cross-cut tunnel has nearly reached the main shaft on the Summit. Arnold & Co. are working the Plebeian lode on Leavenworth mountain, on 276-ounce ore. Matthews & Webb have commenced the foundation of their concentrating works at Idaho Springs. G. W. Rockwell milled five tons of Swamp Angel ore last week, which returned 46 ounces silver and 2-10 ounces gold. Joseph Pirot, on the Free America had a mill run of over five tons of ore last week the first-class milling 96 ounces per ton. Over 30 tons of ore was brought down from the Terrible last week. The returns showed from 80 to 150 ounces silver per ton. The Cooper lease on the Polar Star Extension east is keeping up a steady production. A large amount of unassorted ore is stored in the ore house. The lessees on the Owasco, Brown mountain, are taking out some excellent ore. One party is working on a 600-ounce streak, and another is taking out rich "sulphurets." Some big shipments were made from the Seven-Thirty mine last week. About 30 tons were treated at the at the Public Ore Market, the ore ranging from 90 to 600 ounces to the ton. McNulty & Co. are working on a streak of 150-ounce ore from five to six inches thick, in the breast of the lower Junction adit. They intend to make a shipment of about ten tons in a few days. During the month of February 47 cars of ore were shipped from Georgetown, 35 of which went to Denver, 7 to Argo, 4 to Golden and 1 to Idaho. There were nearly 320 tons, valued at over $70,000. McVeaty & Co. are so well satisfied with the financial worth of the Fred. Rogers that they have leased additional ground below their present workings. It is reported that they have increased their force, and have over a dozen men employed. They are making some excellent shipments, and from one to six inches of ore is shown in different portions of their ground. George Mills informs us of the recent strike made on his property, the Carbon lode, Red Elephant mountain. About 12 inches of mineralized quartz and a nice streak of solid ore has been encountered in the cross-cut run from the hanging to the foot-wall. Between 20 and 24 inches of mineralized quartz and two inches of solid ore is shown in the shaft. Mr. Thomas Cunningham, superintendent of the Horseshoe Mining Company, in Peru district, Summit county, just over Argentine Pass, was in town yesterday. He reports the Queen mine as looking better than ever before. The shaft which has been sunk from the tunnel level has reached the depth of 75 feet, and drifts have been run each way for a distance of 30 feet on the vein, showing a continuous streak of sulphurets from two to four inches in thickness. There are about 12 tons of ore on hand, which has been taken out by development only. No stoping has yet been done. As soon as the trail is opened to Georgetown for a pack train, a shipment will be made.

IDAHO.

LAVA DISTRICT.—Wood River *Times*, March 18: A gentleman just arrived from Champagne creek, in Lava mining district, reports quite a number of prospectors arriving there, and scattered about the hills, which are hardly bare. A fourth lot of ore is ready for shipment, and it is the richest yet shipped from the district. The first shipment from that camp arrived here about the middle of last July, and returned 485 ounces silver per ton, with some gold; no lead. The second was also sampled at the Hailey sampler, and sold at the rate of 633 ounces per ton. The third lot—of four tons—was shipped to Salt Lake City last December, and sampled 814 ounces per ton. The fourth lot on the dump ready for shipment, is said to be much the richest of any. A company is being organized in the East to purchase the Martin and adjoining mines and erect a 20-stamp mill there this summer. There is no doubt but that this promising district is at last coming to the front.

MONTANA.

RICH PROSPECTS NEAR HELENA.—Helena *Independent*, March 18: On January 8th, Messrs. Wm. Butler and James Russell located on the east side of Mount Helena the Butler lode, a relocation of the Silver Belle lode, and realized their fullest hopes in striking it rich. They have a shaft on the claim 40 ft deep, and have struck a claim that is 9 ft between walls. Three and one-half ft of the vein assays in silver and gold $122.50 per ton, and the balance will average as per assay $26. The discovery of this and other lodes within the past few days in sight of Helena is of no small consequence to our city, and it is not unlikely that in a short time Helena will hear the toot of the mill whistles and the hammering of numerous quartz stamps.

THE ANACONDA COMPANY.—*Inter-Mountain*, March 18: The Anaconda Company is now working between 600 and 700 tons of ore per day, and shipping daily almost 100 tons of copper matte; but not content with present facilities, it is also preparing for the erection of a second large concentrator a mile below the present plant and grading for a railroad for the transportation of ore and concentrates. This is a cheering prospect. Taking into consideration its wood contracts, the Anaconda Company is now giving employment to 1,500 men in this and Deer Lodge counties and undoubtedly it supports in Butte and Anaconda fully 5,000 people. Thus is afforded some idea of the immensity and the beneficial results of the Anaconda Company's operations. That such a concern could exist except by adherence to the strictest business principles and under the direction of a master of finance like Mr. Haggin, aided by capable lieutenants, is absurd.

THE STEVENS.—*Inter-Mountain*, March 18: The record of the Stevens as a steady producer of pay ore is being fully maintained. The daily product from the lower level is about 20 tons, and its average assay value in silver and gold $40. Last month the shipments were considerably over 500 tons of ore which was worked. At the mine there is also an extracted reserve of about 500 tons of $25 rock, and at the mill about 1,000 tons more of the same grade. This ore, though of a somewhat low grade, will pay for milling. It was taken from the lower west level while drifting for the richer shoot which now looks so well. The supply of $40 ore is not great, and it is probable that within the next two months deeper sinking will be required, but it is likely that Judge Davis will decide not to incur further expenses for dead work at present, as in other mines he has plenty of available ore to keep the mill supplied. The product of the Stevens is treated at the Silver Bow mill, of which R. B. Wallace No. 1, its former superintendent, is again in charge.

NEW MEXICO.

STRIKE.—A rich gold strike is reported on Cherry creek in the Burros. The old wagon road crosses the lead where the gold was found. Several men are now at work on the property. James St. Clair has made a strike of $500 ore on the Big and Little Colorado mines, on Chloride Flat. The vein is eight inches wide. The ore carries brittle silver. Several tons of ore have already been taken out. "Rusty" Holman is jubilant over a strike made in the Gunsight in Chloride Flat, on the Sherman belt. He says that the slate, of which there is a large quantity, will average $25, and that there is a small streak of mineral through the same which assay $2,000. A two-car shipment of ore from the Great American mine in the Swisshelm mountains last week netted the company $3,300. A force of 20 men is steadily engaged in taking out good ore from this property. There is about 2,000 tons of what is termed low-grade upon the dumps awaiting the erection of a mill at the property. During the past two weeks there has been shipped from Whitewater 13 cars of iron ore to the Benson smelter. It was produced by the Santa Rita mine. There was also shipped one carload of high-grade ore from Smith, Tower & Co.'s mine, at Georgetown, to the Socorro smelter, and one car of concentrates, from McGregor Bros. mill, at Georgetown, to the Socorro smelter. A test made of the ore sent to the Gold Hill by Black & Parks, to be worked at Pinos Altos, shows that the average grade of ore will pay very well to ship from this camp. A sack was picked out of the shipment by Col. H. H. Carpenter, which was believed to be an average, and it returned $77.77. A rich gold strike was made on Whiskey creek, about eight miles from this city, on Sunday last by Messrs. Matt. Rosecrans and L. R. Gordon, who located Harry Garvey in for one-third. The ledge is about 12 inches wide, with from one to two inches of exceedingly rich gold quartz, specimens of which are very fine. Several men were immediately put to work to develop the property, when the true merits of the strike will soon be ascertained. The specimens created quite a sensation on the streets. Everybody was talking of the new strike. No other mineral seems to create so much excitement as free gold.

OREGON.

PLACER AND LEDGE.—Jacksonville *Times*, Mar. 21: Howard & Wakefield are at work in some mines near the mouth of Slate creek and are doing well. Thos. P. Kahler is sinking down on his quartz mine near Rogue river and securing excellent prospects. L. Martin of Ashland, who bought a 40-acre tract of L. Applegate last year, has found a ledge of quartz on it. He has sent samples of the ore to Portland for assay. Mr. Knapp, who took the contract for sinking a shaft on the Enterprise Co.'s ground in this place, is making excellent progress. He is an old miner and understands his business. Abrahm, Levens & Co. have rented what is known as the Grand Applegate mines to a company composed of J. N. Casteel, Chas. Nail and Jas. Wright. The ground has been worked for sometime past by Chinese. The continued pleasant weather has dissipated all hopes for an extended run and most of the miners are cleaning up. Some of them have no water at all, while others will not be able to clean up this season's work unless timely rains intervene. A flourishing mining camp has sprung up on Wagner creek and considerable gold is being taken out there. Garvin & Lewis, who are mining in the bed of the creek, have struck favorable prospects. Neil Bros., who took out good pay last season, are doing very well and doubtless have one of the best claims. Elliott & Snyder also have good diggings. Torrey & Hubbard of Medford are getting down to pay dirt, with favorable results. Noah Allen's claim is the lowest on the creek and Messrs. Anderson, Stephenson and Brown are at work just above him. Six claims in all are being worked. The great drawback there is the depth to bedrock and the numerous boulders, which necessitate the use of derricks.

UTAH.

REVIEW.—Salt Lake *Tribune*, March 20: The clear warm weather stays with us remarkably well; but the movements of metals remains light compared with last year's product, the chief falling off being accounted for in the non-production of the Horn Silver. The receipt of bullion and ore in this city during the week ending March 18th, inclusive, were as follows: Bullion, $79,422.65; ore, $9,950; total, $89,372 65. Product of the week previous, bullion, $39,998.36; ore, $8,640.56. The Ontario produced during the week 73 bars of bullion, $54,802.65; a total yield for this year to date, of $360,397.38. The Ontario is on a solid basis, and all is going on well with it. The Silver Reef district yielded during the week $6,420 in silver, of which the Stormont furnished two bars, valued at $3,450, and the Christy two bars, $2,970. The product of the Hanauer smelter since its starting up anew on the 11th was seven cars of bullion, $18,200. The ore receipts were $2,500 from the Crescent; $4,800 from the Honerine at Stockton, Utah, and $2,650 of Wood River ores.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

The Pacific Coast Labor Convention.

Resolutions and Principles.

During last week the delegates to the Pacific Coast Trade and Labor Convention met in this city to discuss the matters concerning the labor question on the coast. The meetings were secret, and on their conclusion the following report of the proceedings was given to the press:

For three nights the convention of the trades and labor organizations of the Pacific coast has been in executive session debating the resolutions which are finally put forth to the public as embodying the line of action which they propose to follow in the future, and to secure the carrying into effect of which an organizing committee has been appointed and ample funds provided. Upon each of the subjoined resolutions the debate was earnest and long continued, and when carried they were adopted unanimously. The resolutions not adopted are not given to the press. Those adopted and found below summarize the work of the convention. Upon each resolution means have been provided to carry them into execution. The convention having been called to unify labor and discuss "hard times," the following resolutions were carried:

Hard Times.

Resolved, That in the opinion of this convention "hard times" are the result of a monopolization by non-producers of the natural resources, the tools of production and the medium of exchange, and must occur periodically until these monopolies are abolished.

Resolved, That the remedy for "hard times" can only be ascertained by the education of the producing classes of shop and farm, and, when found, can only be put in practice by their organization and federation. [Proposed by J. J. McClimont of Colorado].

The Grangers.

Resolved, That this convention is of the opinion that the agricultural classes represented here by the Grangers' organization, which pursues an active propaganda on the lines of practical co-operation, dispensing with middle-men, and which is composed of the producers on farm and field, are necessary and important factors in the solution of the labor question.

Resolved, That as representing the workers of the cities and towns, we extend to them the hand of fellowship and pledge them fraternal aid. [Proposed by J. J. Martin of San Francisco.]

Resolved, By the representatives of the Grangers, on behalf of the Patrons of Husbandry represented in this convention, we pledge to the organized labor of the cities and towns our good will, our friendship and our assistance in the work of organization and education. [Proposed by E. Kelsey, of the Grangers.]

Declaration of Principles.

Resolved, That, revoicing the words of such menas Louis Blanc and Victor Hugo of France, Karl Marx and William Liebknecht of Germany, H. M. Hyndman and William Morris of England, Bronterre O'Brien and Michael Davitt of Ireland, Piy Margal of Spain, Andreas Schen of Austria, and John Swinton, Joseph R. Buchanan and Henry Appleton of America, we, the Pacific Coast Congress of Trades and Labor Organizations, unanimously declare: First, that every individual who is willing to work has a right to demand from organized society the opportunity to labor and to receive for that toil its full value; second, that it is the duty of the whole people in their collective capacity to so administer the affairs of the commonwealth as to secure to all their just demand. [Proposed by P. Ross Martin of Sacramento, Cal.]

WHEREAS, The continued invention of machinery, the monopolization of the natural resources, competition, profit, production and the concentration of capital are fast reducing the working classes to absolute slavery;

Resolved, That it is imperative that every branch of wage workers be organized and that when so organized the work of agitation, organization, federation and education be unceasingly pursued. [Proposed by J. H. Thorner and Alfred Reed of the Seaman's Union.]

Plan of Action.

Resolved, That an organizing committee of eleven be appointed to federate all the labor organizations of the coast upon the following basis: The name to be the Central Labor Union of the Pacific Coast; each union to send one delegate for each 250 members or fraction thereof; each class of unions in particular occupations to be federated under the name of Trades' Assemblies at the earliest possible moment. [Proposed by Martin Schneider of the Dyers' Union.]

The Organizing Committee.

The committee elected to organize the movement were these: E. A. Wallazz, of S. F.; P. Ross Martin, of Sacramento; E. Kelsey, of the Grangers; W. C. Owen, of S. F.; C. Danielswietz, of S. F.; A. B. Tully, of San Bernardino; J. A. Anderson, of S. F.; E. G. Anderson, of S. F.; Edward Cagney, of Eureka; B. G. Haskill, of S. F.; Theodore Hallhick, of S. F.; James J. Martin, of S. F.; Frank Roney, of S. F.; C. F. Keller, of Tulare county; J. H. Redstone, of S. F.

Resolved, That this convention, while not condemning strikes for shorter hours or higher pay as temporary measures of relief, regards the nationalization of land, of the means of transportation, of the circulating medium and of the implements of production as the only satisfactory solution of the labor question.

Resolved, That this convention, having regard to the strained relations at present existing between employer and employed, looks with the gravest apprehension upon the virtual establishment of a standing army in this country by the continued enrollment of the new militia corps, and the employment by the capitalists of armed detectives, and that this convention commends this matter to the serious attention of the labor organizations of the coast.

Resolved, That it shall be the duty of all accredited delegates to this convention to invite their respective organizations to attend a mass meeting in a hall, to be fixed by the committee, on Saturday, March 28th, for the purpose of receiving the report of this convention, and that a committee of nine be appointed to prepare and speak to such report.

SHIPPING business amounting to nearly four millions yearly has been established in Philadelphia, since June, by American agents of European capitalists engaged in refining petroleum in France, Spain and Austria, and since October last the agency has shipped nearly 500,000 barrels of crude oil.

Market Reports.

Lumber at Wholesale.

There is a fair trade in lumber, but no special changes in price. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No. 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $39; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 6 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 refuse) do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and ¼x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates—Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.20; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for fir and spruce are as follows:

ROUGH MERCHANTABLE.—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.60; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $24.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

Dressed T and G Flooring, 1x0, No. 1, vertical grain, ₱ M ft, $38.60; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.60; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $20.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.60; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1½ inch, ₱ M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

PINE—Rough, $14.00: No. 2, $11.00; do do in lengths, $12.00; rough, 40 to 50 ft lengths, $15.00; do 50 to 60 ft, $16.00; T and G Flooring, 1x6, $25 00; do do 1¼x6, $27.00; do do 1x4, $27.00; do do No. 2, $20.00; Vertical Grain T and G Flooring, 1x6, $28.00; do do do 1¼x6, 1x4, $30.00; Stepping, $35.00; Furring, 1x2, per lineal ft, ¾c.

REDWOOD—Rough, $16 00; No. 2, $12.00; Surfaced, $30.00; do, 1x8, $28.00; do, 1x0, $28.00; T and G, 6 in. 12 ft and over, $28.00; do do, 7 to 11 ft, $25.00; do do, under 7 ft, $20.00; Rustic, $30.00; do No. 2, $25.00; T and G Beaded, 12 ft and over, $30.00; do do, 7 to 11 ft, $25.00; do do, under 7 ft, $20.00; Siding, ½ in, $22 50; Picket, fancy, $25.00; do do, rough pointed, $15.00; do do, square, $14.00; Battens, ½x3 in, per lineal ft, ¾ c; Shingles, $2.00; Lathe, 1½, $3 25; do 1½, $3.75; Dunnage Boards, less 5 per cent, delivered, $16.00.

Nails.

We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.90: 8d and 9d, $3.00 6d and 7d, $3.25 4d and 5d, $3.50; 3d, $4.25; 2d, $5.50

BARRELS.—¾ inch, $6.75; ⅝ inch, $5.75; 1 inch, $5.25; 1¼ inch, $4.50; 1½ inch, $4.25; 1¾ inch, $3.75; 1½ inch, $3.50.

LINING.—¾ inch, $7.25; ⅝ inch, $8.75.

TOBACCO.—10d, $3.25 8d, $3.50; 6d to 7d, $3.76.

CLINCH.—6d to 30d, $4.50.

SLATING.—5d, $3.75; 4d, $3.75; 3d, $4.50; 2d, $5.76.

FINISHING.—2d, 1 inch, $8.75; 3d, 1¼ inch, $6.76; 4d, 1½ to 1¾ inch, $4.50; 6d, 2 inch, $4.25; 8d, 2½ inch, $4.00; 10d, 1 inch and over, $3.75.

CASING AND BOX.—10d to 30d, $3.50; 8d, $3.75; 6d, $8.00; 4d, $4.25; 3d, $5.25.

FINE BLUED.—4d, $4.50; 3d, $5.75; 2d, $6 50

CUT SPIKES.—All sizes, $3.00

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 00 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Material.

Lime, per barrel, $1.50@$1.00. Plaster, $2.75–3.00. Eastern Plaster, $3.00–3.26. Rosendale Cement, $2.25–2.75. Portland Cement, $3.50–3.75. Fire Brick, per 1,000, $40 @ $45, according to brand; hard, $10.00@$12,00; red, $8.00@$8.50; soft, $7.50; face, $30.00.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—San Benito and Monterey Counties.
GEO. MCDOWELL—Santa Clara and Santa CRUZ Co's.
G. W. INGALLS—Arizona.
M. S. PRIME—Alameda County.
MRS. OZIER—Napa County.
W. H. H. HUSSEY—Contra Costa County.
C. M. CARR—Oakland.
W. B. TURNER, Santa Barbara and San Luis Obispo Cos.
J. M. LOGAN, San Francisco.
F. W. SMITH, Arizona.
ED. SMITH, San Jose.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY TO THE LABEL ON YOUR PAPER.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING MARCH 17, 1885.

313,975.—FRUIT CANNING APPARATUS—W. H. Austin, Vacaville, Cal.

313,911. GRAIN CLEANER—Daniel Best, Albany, Or.

314,099.—FRUIT JAR—J. G. Briggs, San Jose, Cal.

313,928. AUTOMATIC RAILWAY SWITCH—C. L. Drake, S. F.

314,117.—PUMP—C. H. Foster, Alameda, Cal.

314,015.—DERRICK—O. E. Halin, S. F.

314,180.—TESTING SEALED CANS—M. L. Hutchings, Astoria, Or.

314,026.—ILLUMINATING BASEMENTS—P. H. Jackson, S. F.

314,135.—ROAD SCRAPER AND EXCAVATOR—C. M. Jones, Fresno, Cal.

313,872.—CLINOMETER—J. Kindleberger, Los Angeles, Cal.

314,036.—DYNAMITE SHELL—M. F. Jones, Fort Apache, A. T.

314,086.—BUNG CUTTER—Henry Waas, S. F.

314,093.—STOVE—Sarah A. H. Williamson, Carson, Nev.

nent officers will be elected to-day, and in our next issue further information will be given to the public.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CABLE RAILWAYS.—Joel B. Low and A. K. Grim, S. F. No. 313,602. Dated March 10, 1885. This improvement consists in novel frame-work sections by which the tube, track and slot-irons are supported, the sections being in turn united and bound together by the track, slot-irons and tube in such a manner as to prevent the slot from opening or closing.

BITTING AND DRIVING HARNESS.—Richard C. Irvine, Sacramento, No. 313,673. Dated March 10, 1885. This is a bitting harness which may readily be converted into a driving harness and *vice versa*. It consists in the adaptation of the hip-strap of the driving harness to serve as the side back-straps of the bitting harness; in a fastening on each side of the saddle adapted to engage the ends of the side back-straps and the side check straps of the bitting harness and the shaft bearers and tugs of the driving harness, and in suitable fastenings upon said straps by which their various engagements are readily effected. In teaching a colt to become accustomed to the bit or "bridle-wise," as it is termed, a harness known as a "hittiug" harness is employed. This differs from the ordinary driving harness in the omission of some parts, and changed construction and adaptation of others to make the harness serve the special purpose. The bitting harness is usually a separate and distinct one from that used for driving, and they cannot be used interchangeably. It is the object of this invention to provide by means of a proper construction, arrangement and adaptation of parts, a harness which can be readily converted from one to the other kind and answer effectively for either.

GOVERNOR.—Byron Jackson, S. F. No. 313,595. Dated March 10, 1885. This governor for steam engines is especially applicable in that class in which the valve-operating eccentric is moved relative to its shaft by centrifugally acting weights, so as to vary the throw of the valve, and thus control the admission of steam to the cylinder. It consists of two eccentrics, one of which is movable about the first, a means for actuating the two eccentrics, so that the action of the weighted, centrifugally-operating arms is relieved from the strain caused by the friction of an unbalanced slide-valve. It also consists in a means for adjusting and regulating centripetally-operating springs, so that they may be regulated for different rates. In the construction of engines—governors of that class in which either a single eccentric is turned upon the shaft, or in which a second eccentric is turned upon the first, in order to insure uniform lead-openings of the valve, while the closing or cut-off point is varied, the whole strain of moving the valve under the friction caused by the steam pressure devolves upon the eccentric, and from this it acts upon the weights, by the centrifugal action of which the eccentrics are adjusted, so that with a varying steam pressure the action of these weights will vary considerably and the cut-off be made irregular. In Mr. Jackson's invention he has connected the eccentrics and driver by a crank arm or link, so that one eccentric may be moved about the shaft within the other, which drives the valve and the weighted arms, by the centrifugal action, by which the eccentric is moved to vary the throw of the valve, and relieved from the strain of moving the valve.

DOUBLE-ACTING SUBMERGED PUMP.—Chas. H. Foster, Alameda. No. 314,417. Dated March 17th, 1885. This double-acting submerged pump is for deep wells, and more especially for artesian or bored wells, in which the diametrical space is limited. The invention consists in a novel double-valved plunger and hollow piston as applied to a cylinder having valves at each end. The object is to provide a double-acting pump having small area in cross-section, whereby it is adapted for artesian or bored wells, or for any wells in which the space is limited, and by reason of its double action has an increased capacity in a given time.

DERRICK.—Ole E. Halin, S. F. No. 314,015. Dated March 17, 1885. The improved derrick consists in a platform supported by peculiarly-hinged folding legs, horizontal, spaced, and intermeshing gears, bearing sprocket or chain pulleys between them, a chain tackle passing around and between the chain pulleys and over guide pulleys in the platform, a retaining pawl for the chain, a hinged lever and ratchet wheel mechanism between it and the driving shaft of the operating gears, and in a mechanism for throwing the lever out of engagement.

ELEVATOR AND FIRE ESCAPE.—Zachariss Ludwig, East Oakland, No. 312,784. Dated, Feb. 24, 1885. This is an apparatus which is especially used as a fire-escape, although it may be used for other purposes, where it is necessary for persons to raise or lower themselves within a building without the use of an engine or any other exterior mechanism. It consists of a cage or platform suspended by a cable from a drum or roller at the top of the building, having guides between which it travels, suitable safety catches, and weights suspended from ropes passing around pulleys which are fixed upon the shaft or drum, around which the cable passes; a brake and a means for applying the same so as to regulate the rate of ascent; secondary ropes passing around pulleys upon the upper cable drum, and other pulleys situated beneath the lower floor; a point of rest, and levers or arms within the cage which may be applied to produce friction against the ropes passing around these pulleys to regulate the descent of the cage. It also consists in the application of supplemental weights having ropes passing over pulleys and leading down into the inside of the well in which the cage moves, with hooks or attachments near the bottom, where they remain attached when out of use. When it is desired to elevate the cage to the top of the shaft or well, two or more of these ropes may be detached from their fastenings and attached to the sides of the cage, so that with the additional weights upon the opposite ends of the ropes will assist in raising the cage to the top. Between the walls of the elevator shaft and the surrounding portions of the building may be formed an air space which will carry away any smoke which may enter it, and may also prevent undue heating of the elevator shaft, by reason of the fire surrounding it, so that it will be possible for persons to descend it in a case of emergency.

Mining Share Market.

There has been very little of interest in the stock market for the week past. The people here are like those in Virginia City, close by the mines. Of these the *Enterprise* says: The fact of the matter is that the people here expect everything to be done in a moment, and cannot wait for developments. If a bonanza is not produced in a week the small buyers get frightened and sell out. The consequence is that the price of any particular stock is liable to go down. The people here are extremists; there is no half-way about them, and they are either very enthusiastic or very blue. If any one would for a moment consider the situation they must come to the conclusion that it takes time to run drifts, build stations, make cross cuts and do other work in a mine necessary to ascertain the condition and prospect of the same. The price of Norcross has dropped a little from the fact that cross-cutting has not been commenced on the 2900 and 3000 levels, and a bonanza has not been shown up. The managers of the Norcross do not propose to cross-cut until the drifts have been advanced to a distance satisfactory to themselves, and as they fully understand the situation, it is folly for outsiders to imagine that the Norcross is a failure. The officers of the mine say that the prospect of finding a large body of ore is better at present than ever.

Bullion Shipments.

Christy, March 17, $1,500; Honerme, 18, $4,800; Ontario, 19, $19,605; Stormont, 20, $2,850, Crescent, 20, $2,600; Wood River ore, 20, $1,150; Hananer, 20, $18,200; Wood River ore, 22, $1,800; Christy, 22, $1,555; Ontario, 22, $19,605. The Utah base bullion and ore output for the week was 54 cars of bullion and eight cars ore. The weight of the bullion was 1,328,400 pounds, and the ore 242,700 pounds.

A GAS METER inspector, examined by the Gas Committee of the New York Legislature, on Monday, said that some meters run fast and some run slow. In Philadelphia he found meters were from 3 to 16 per cent fast.

HEALD'S BUSINESS COLLEGE, 24 Post St. S. F. Send for Circular.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

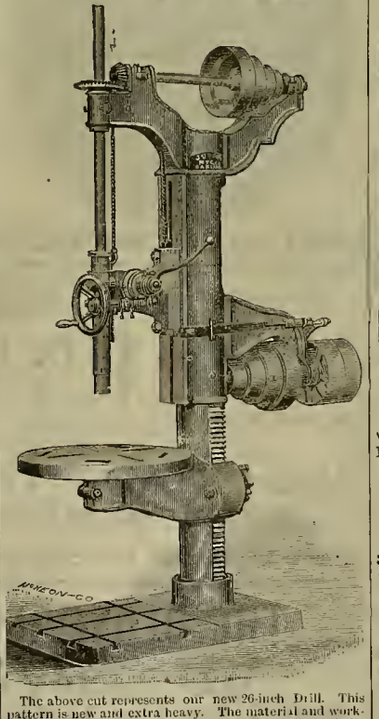
Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES"—By C. H. Aaron—Is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores. The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is $1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

DRILL PRESS.

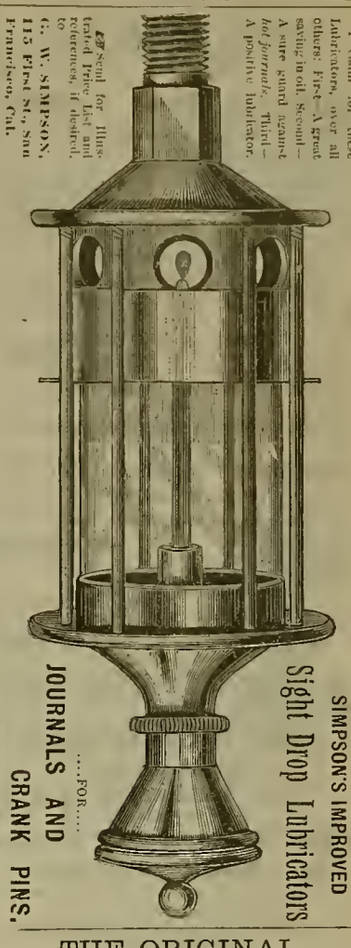


The above cut represents our new 26-inch Drill. This pattern is new and extra heavy. The material and workmanship is first-class in every particular. The spindle and head is counterbalanced with chain and weight, with a vertical adjustment of 20 inches. The spindle is made of hammered steel, bored out to fit the No. 3 Morse Drill Socket, and has 8 inches of travel. The quick return attachment is very strong, simple and perfect in its action. The face-plate swings round the column in any position, can be raised or lowered 18 inches, and will receive work 32 inches high and 26 inches diameter. The bed-plate is planed, and will receive work 46 inches high. The pinion and rack for lowering the table is placed on the side and revolves with the table. In this position, the dirt and borings falling from the table cannot get in the rack. The pulleys on lower cone shaft are 10 inches diameter for 3-inch belt, and should run 250 revolutions per minute. There are four belt speeds on cones, which are turned suitable for 2½-inch belt. Weight, 1,500 pounds.

Price, $275, less 10 per cent.

We also manufacture a Pulley Drilling Machine for drilling the set screw holes in Pulley Hubs without drilling through the outside rim. It can be attached to our drill in one minute, simply by removing the face-plate and setting pulley drilling attachment in the face-plate socket. This machine can be attached to any ordinary drilling machine. Weight 100 pounds. **Price, $50.**

JUDSON MANUFACTURING CO., 8 Pine St., San Francisco, Manufacturers of Machinery, Bar Iron, Files, etc. Finished Shafting, Pulleys and Hangers made to order.



I claim for these Lubricators, over all others: First—A great saving in oil. Second—A sure guard against hot journals. Third—A positive lubricator.
Send for Illustrated Price List and references, if desired, to
G. W. SIMPSON, 115 First St., San Francisco, Cal.

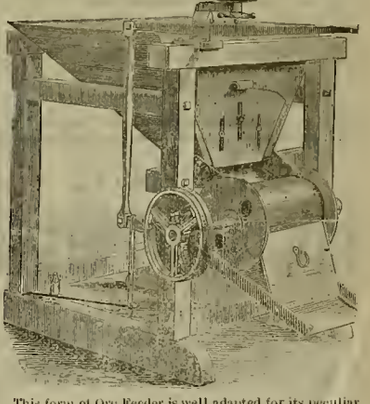
THE ORIGINAL
Roller Ore Feeder.

(PATENTED JUNE 24, 1873.)



This form of Ore Feeder is well adapted for its peculiar work.

Manufacturers of the Celebrated "Challenge" Ore Feeders for wet and sticky ores; also "Stanford Improved" Ore Feeders and Tullock's Ore Feeders for dry ores.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco.

Smith's Patent Belt Fasteners.

Are positively unequaled for fastening **Leather, Rubber,** or **Cotton Belting.**

THE ONLY FASTENER that will run under tighteners, on patent rolls in flour mills, and Electric Light machines

Easier to apply than Lacings and far more Economical.

Patented Sept. 20, 1881; Aug. 15, 1882; June 16, 1884.

PRICE LIST.

No. 1—For large drive belts, per box of 100.....$2 00
No. 2—For Cotton drive belts, per box of 100..... 1 75
No. 3—For Rubber drive belts, per box of 100..... 1 50
No. 4—For single Leather belts, per box..... 1 25
Combination Punch with guides and nippers..... 1 25
Reamers for taking fasteners out..... 25

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

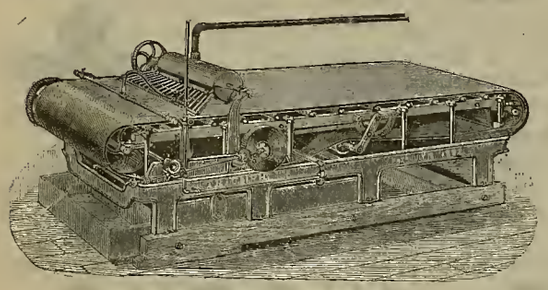
$1,000 CHALLENGE ACCEPTED!



THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue" Vanning Machines**, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarly saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000**, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

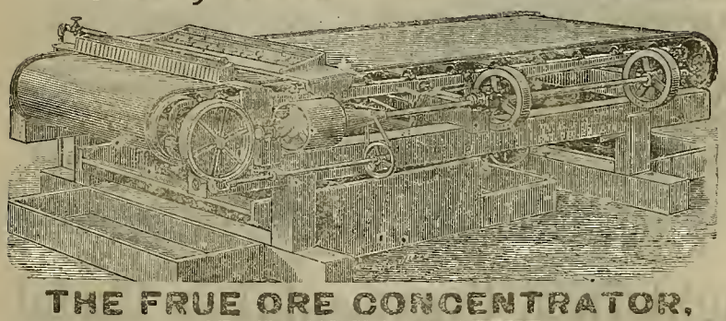
We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St., San Francisco, Cal

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

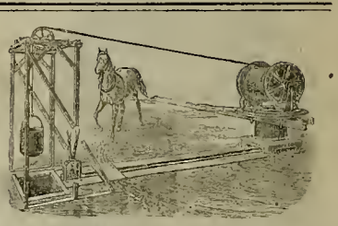
THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been **THOROUGHLY TESTED** for the past **TWO YEARS**, under a **GREAT VARIETY** of **CONDITIONS**, giving most **EXTRAORDINARY** results **FAR IN ADVANCE** of anything **EVER BEFORE REALIZED.** A recent **COMPETITIVE TEST** at the Carlisle Mine in Mexico, showed an **ADVANTAGE OF OVER 30 PER CENT** in favor of **THE DUNCAN.** The amount **SAVED OVER THE FRUE** being sufficient to **PAY THE ENTIRE COST** of the machines **EVERY MONTH OF THE YEAR.** One of its **MOST VALUABLE** features is as an **AMALGAMATOR.** It saves all **THE AMALGAM GOLD** and **SILVER** that **ESCAPES** the **BATTERIES, PANS** or **SETTLERS**, making the machine worth **MORE** than **ITS COST** for **THIS PURPOSE ALONE.**



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of a Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope SEND FOR CIRCULAR.

HOISTING WORKS.

FOR SALE—TITLE U. S. PATENT.

A one-half interest, or the whole, of a valuable GOLD MINE, situated in the Quartzburg Mining District, Mariposa County, Cal. This Quartz Mine prospects from $30 to $90 per ton in gold upon the pay streak, and will pay $15 per ton, average, for all the ores. It is a 3-foot ledge, and a double compartment shaft is now down 200 feet. A mill and reduction works are now well under way; a boarding-house completed, and a water ditch, and a large part of the machinery bought and erected; roads made, etc. The only reason for selling any part is, that the owners lack sufficient means to put the property into productive shape. For further information address, GILBERT CLEMENTS, 313 Front St., San Francisco.

VOLUME XLXX
Number 14.

The Efficiency of Centrifugal Pumps.

We publish below a report by Mr. J. C. Pierson, C. E., Surveyor of Sacramento County, respecting the performance of a pumping plant erected by the San Francisco Tool Company for the San Francisco Savings Union, both of this city. The pumps were constructed under instructions from Mr. P. J. Van Lohensels, the agent of the Savings Union, and were erected on the Pierson district, 25 miles below Sacramento, near Walnut Grove.

The pumps are of dissimilar character, one being of the turbine, or enclosed runner, type, the other of the Gwynne type.

Mr. Pierson was a neutral agent in the tests, acting by consent of both the San Francisco Tool Company and Mr. Van Lohensels. No one representing the Tool Company was present at the tests, which were conducted by Mr. Pierson alone.

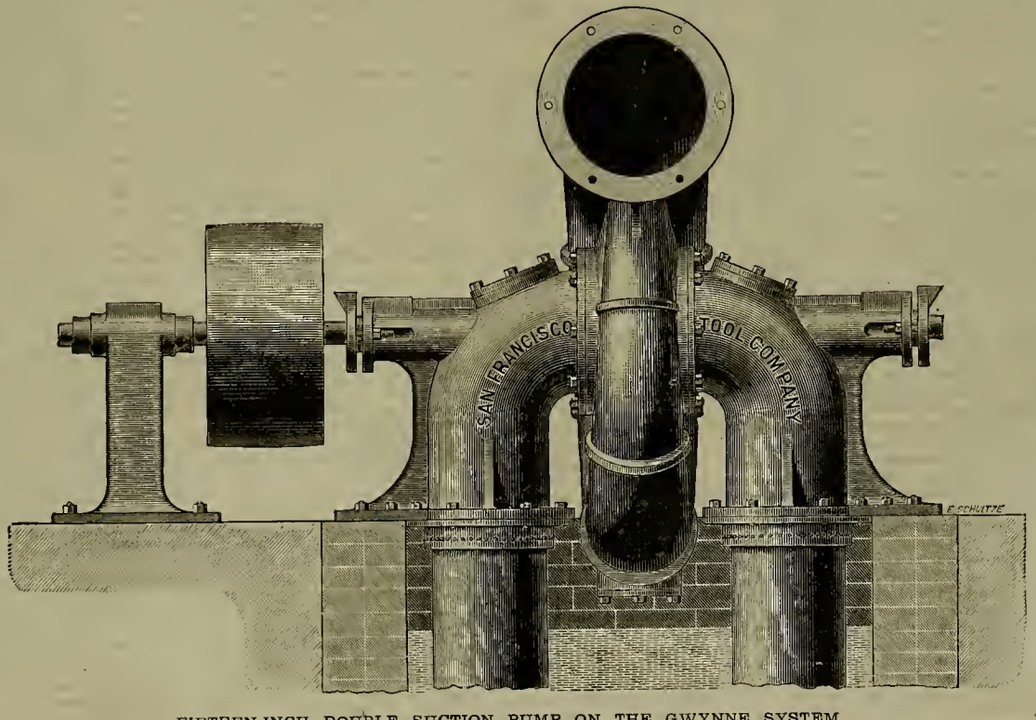
The table, aside from the valuable information it contains in an engineering way, discloses a higher duty for pumps of this class than has hitherto been thought practicable, about 75 per cent of useful effect.

Messrs. Gwynne & Co., of London, the most celebrated and extensive makers of this kind of machinery in the world, have attained an efficiency of 67 per cent in some cases, but with machinery constructed with the greatest care and costing twice as much in proportion as that referred to in the report. It should be explained that the 12-inch turbine pump referred to is one wherein there is centrifugal action alone, there being little or no effect from mechanical impact. The efficiency declines as soon as the flow of water has passed a speed of 10 feet per second, or the pressure much exceeds that due to the head. The Gwynne pump, on the contrary, employing direct impact, can be forced to any degree without the same proportionate loss of power. The tables will show this in the separate tests at different speeds and pressures.

The San Francisco Tool Company propose soon to conduct some careful tests with what are called "Torrent" pumps. These are a recent invention and operate without pipes or valves, and it is fully expected that an efficiency equal to that in the Parsons' experiments will be obtained—not the maximum of 80 per cent, which has always been questioned, but 75 per cent or perhaps a little more under a moderate lift. The efficiency of centrifugal pumps diminishes with the head or lift for obvious reasons.

Considering the water ducts from the inlet to the discharge as being of uniform area, it is evident the greatest efficiency is attained when the velocity of the water is uniform or is slowly changed. In high lifts this uniformity of flow is disturbed or destroyed by the higher speed of the runner required and the relative reduction of velocity through the runner. Otherwise the discharge would increase with the head, a thing not in accordance with facts, and disproved by all experiment.

The San Francisco Tool Company have constructed pumps to work successfully under a head of 80 feet, and in one case in El Dorado county a single runner pump drives water 115 feet high. We publish an engraving of the 15-in. Gwynne pump referred to in the tables,



FIFTEEN-INCH DOUBLE SUCTION PUMP ON THE GWYNNE SYSTEM.

The district drained by the pumps contains 8,700 acres, and is enclosed by a levee fifteen and a half miles long. The whole of this vast tract was kept clear of water during the great freshets of January last, working most of the time against a head of 14 feet. The whole of the district is under cultivation at this time.

Mr. Pierson's report is as follows:

SACRAMENTO, CAL., March 2, 1885.

To the San Francisco Tool Co., First and Stevenson streets, S. F.:—In answer to your request of the 12th ult. I herewith transmit to you the result of the measurements made in February last, of the volume of water discharged and the power consumed by the pumps in the Pierson Reclamation District. The pumping plant, as you are aware, is for drainage purposes and consists of one 12-in. Turbine pump and one 15-in. Gwynne pump, the motive power being a 12x24 engine, "Myers Cut-off." The reservoir or basin used for the purpose of collecting the seepage and rain water, covering an area of about 300 acres is distant from the pumping station about half a mile; the water being conducted to the pumps by a ditch of nearly uniform cross section, but of such limited size as to cause a variation of the height of the water in the sump with each variation in the volume of discharge, consequently the head or height through which the water is raised to the discharge pipe varies with the volume. The amount of water discharged by the pumps in a given time was ascertained by a series of gaugings of the ditch leading to the pumps, the mean of three or more tests being taken as the volume of discharge for that time, the speed of the pumps remaining uniform during the trial. Simultaneously with these gaugings, cards were taken from the engine by means of a Richards indicator, from which the gross power exerted by the engine was computed. Subsequently cards were taken of the pumps running empty, *i. e.*, not primed, and also friction cards of the engine. Deducting these from the gross power and the power consumed in lifting the water and driving it through the discharge pipe was arrived at. In the following table each measurement numbered one, two, three, etc., is the mean result of three trials:

No.	1	2	3	4	5	6	7
Water area of Ditch in sq. ft.	19.36	12.50	14.80	34.40	20.58	33.30	30.70
Mean velocity of Flow in ft per second.	1.77	2.90	2.44	.30	.77	.40	.80
Volume of Water discharged in gallons per minute.	15421.4	16312.5	16250.4	4644.0	10232.3	5594.0	11070.0
Head or height to which water was raised in feet.	8.0	9.0	8.65	6.4	6.9	6.5	7.1
Equivalent in H. P. of weight of water discharged per minute.	31.15	37.07	35.50	7.50	17.83	9.83	19.85
Gross indicated H. P. of Engine.	55.86	62.93	54.66	18.20	40.66	24.35	40.12
Net H. P. after deducting friction	43.86	50.93	42.66	12.20	28.56	18.35	37.12
Speed of Engine in revolutions per minute.	86	91	88	84	84	92	80
Per cent of power realized in actual weight of water lifted.	.71	.728	.83	.614	.624	.535	.54
Velocity of water in suction pipes in ft. per second.	14.5	15.4	15.3	13.1	14.5	16.56	10.90
Size and number of Pump.	Both Pumps.	" "	" "	Single No. 12	" " 15	" " 12	Both Pumps.

I am not prepared to draw conclusions from tabled results must be considered as so much this single series of tests, owing part to the fact that the results having been worked out subsequent to the trial, and having had no opportunity of since extending the trial, I am unable to reconcile some apparent differences; and further, owing to the fact that test 2 was the maximum capacity of the ditch to supply the pumps with water, no extreme in respect to velocity *vs.* power could be reached. Again, the fact that the runners of the two pumps run at different velocities makes the matter of conclusions more complicated. Therefore, these preliminary data to be used in connection with further data to be obtained hereafter. In this respect they may be considered valuable as being perhaps the first measurements of volume and power where accuracy has been aimed at of this form of pumps.

Most respectfully yours,
J. C. PIERSON, C. E.

Metallurgical Works.

The lead refining and desilverizing business has developed into very large proportions in this country. The only two mining companies which do their own refining, are the Richmond, of Eureka, Nevada, and Horn Silver, of Utah, the latter having extensive refining works at Chicago. In addition to these, there are the Germania Works at Salt Lake city, Pueblo Works at Pueblo, Colorado; the Omaha, Kansas city; Aurora, (Illinois); St. Louis, Chicago and Pittsburgh Works; the works of Balbach & Co., Newark, N. J.; the Manhattan, and the Crooke Works at New York, Nathorp Refining Co. at Nathorp, Shaffer Co., Colorado; and Selby Lead Works at San Francisco. The latter named works, for many years situated at North Beach, in this city, are to be removed shortly to a point on the bay shore, near Vallejo junction, in Contra Costa county, alongside the overland railroad track. For many months workmen have been grading and preparing the site for the new plant. The establishment will be much enlarged and improved, and have better facilities for carrying on its work. There is a wharf for vessels immediately in front of the works, and the railroad tracks are in the rear of the buildings, so that the transportation facilities are good. The Selby Company will have its own steamer running to the works. A good deal of the old plant will be removed to the new site and many new appliances will be added. The works will run night and day, an electric lighting plant having been put in to admit of this. The many years' experience in the business will enable the works to carry on the various branches in the best manner, and the extension of their facilities cannot fail to be of benefit to the mining interest of this coast.

LOCAL incorporations disbursed $287,780 in dividends in March as follows: Gas and water companies, $51,000; insurance, $8,000; powder, $15,000; street railroad, $17,650; mining, $194,930; miscellaneous, $1,200.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Cannot Let the Mining Law Alone.

EDITORS PRESS:—It was stated some weeks ago in the pages of the PRESS that a memorial and joint resolution had been presented to Congress praying that our mining law might be so changed that $50 paid into the school fund of a State or Territory would commute the $100 expenditure for labor as now required. The particular Legislature from which this memorial emanated was not mentioned, but it may be assumed to be that of some State with a depleted school fund, and not at all anxious to be publicly just, provided it can only serve its own petty ends. Why will not agitators and political schemers let our excellent mining law alone?

It is working satisfactorily for all who are relying on mining as a legitimate business. Under the law as it is now, a centless prospector or miner can by his own labor preserve his title to mineral lodes he has gone out into the mountains to discover, even at the risk of losing his life from Indian bullets. He may have held such lodes for years, and may hold them for years more, but who will dare to say that it is not just and right he should hold them as long as he meets the requirements of federal law? If the iniquitous change as proposed in the memorial and resolution referred to were effected, not one prospector in twenty would be able to comply with its requirements. What would he the result? The claim-owner would relocate his ground at the end of the year, and let the school fund of his county or State remain empty. But just then, it is supposed, the capitalist would come to the front, and laying claim to abandoned lodes would go on year after year paying $50 for each to help the public schools.

The ordinary capitalist is very rarely a fool, and hence he frequently refuses to take even a present of an unprospected mining claim. He knows too well by experience that it is judicious labor which gives value to a mineral lode to throw his money into a school fund under the pretext that he is holding mining ground. The "tenderfoot" speculator might want ledges of that sort, but he would soon tire of paying $50 a year for each, without any improvement being effected by work. The annual labor of the prospector will not develop a lode, but it frequently proves whether it is worthy of more extended efforts or ought to be abandoned.

There is a sort of under-current swaying green speculators, and silly legislators, too, as it now appears that the days of the pioneer explorer are numbered. They suppose that he has performed his part in finding lodes, but they deprecate his sitting down by them to wait for a cash reward. As long as the present mining law is in force the prospector who is able to work cannot be despoiled of his treasures. If the law were so modified that the tenacious, successful discoverer could be ousted from his claims, there would be rejoicing in some quarters from which only the flash of covetous eyes comes now.

Within the last five years several attemp's have been put forth with the very end in view I have indicated. Again and again the MINING PRESS has successfully checked these wily raids. The present attack from a paltry Legislature will amount to nothing, but it ought to warn the mining community that in order to maintain inviolate our really effective mining law, there must on its part be constant vigilance and a readiness to battle for its rights.

A PROSPECTOR.

Cochise County, Arizona, March 28th, 1885.

Lively and Dull Times.

Is Gold King?

EDITORS PRESS: I have recently read the admirable and earnest article written by Mr. A. B. Paul, and published in your issue of March 7, 1885.

His position, loosely stated, is that gold being king, we want plenty of gold, that we may have a strong and vigorous king. In two places he regrets the fact that "things are as they are," admits that in some way, society is a living error, but maintains that it is best, nevertheless, to make the error a *lively* one.

General Grant once said, "If we have a bad law, let us execute it vigorously; its evils will all the sooner appear, and it may the sooner be repealed." On that ground, the proposition of Mr. Paul would be, and is, a practical one. Let gold and silver be placed before and in the hands of the people, in any quantity, and, as in bonanza times, everything would be lively; but the liveliest process in operation, as then, would be the concentration of gold and silver, and other real wealth, and the sources of wealth, in the hands of the few. When, so rapidly and universally, did the fortunes of the moderately wealthy of this city and State, go into the hands of the few as in bonanza times, as when during a series of years, the Comstock and other mining camps, were manipulated in every possible manner to throw their entire product in the hands of a few prominent operators? And this would now be the result, were the whole silver belt put under the immediate process of resurrection.

The mines would be opened by capitalists, all the percentages of profit, even the miners' wages would, by devious paths and pernicious processes, which are to-day in legal operation, be turned into the already groaning coffers of the men and the class who, to-day, more than all others combined, stand in the way of beneficial production and progress. Their capital would be enormously increased, and looking for new investments, it would fasten on the most fundamental and productive elements of bargain and sale, land and water, land and water privileges, transportations, manufactures and staple commerce; and more than *ever* these would be concentrated in the bands of a few, and more *firmly* than ever a privileged class would become fixed and settled upon the country, and more than ever would the laboring classes become the unresisting slaves of the capitalistic lords and the subjects of the Gold King, whose rule has never been any too merciful.

It is an erroneous impression which many have, that "lively times" constitute good times; good, in the sense that every man secures the results of his own handiwork, sits under his own vine and fig tree unmolested, undisturbed, unplundered. "Lively times" are those times when pre-eminently the profits which should be enjoyed by the producers are being transferred from the pockets of the many to the pockets of the few with the greatest possible rapidity. From 1879 to 1882-83 times in the United States were comparatively lively. Jay Gould, and Vanderbilt, and hundreds of others during that interval piled up their tens of millions. From less than a million of men who were out of employment previous to 1879, the number has been increased to about two million, at this date with two or three more years of "dull times" yet to hear from.

In all probability before another revival of trade sets in, such as come every few years, two and one-half or three millions will be out of steady employment. It is no time to judge of the results of "lively times" until they are gone, and the subsequent period of depression and dullness has well nigh come to an end. At this particular point, when all the debtor class have liquidated or, have been fleeced; indeed, when the shearing time, for the producing industrial classes has passed, then can be determined the result of the previous lively years, active with business and enterprise. Then it will be found that the wool is in the hands of the shepherds or money kings and the sheep are shivering in bleak March and April winds, compelled to throw their energies into another period of lively commerce, trade and manufacture. Not only compeled but ready *from* sheer want to accept any wages; merely because they are enabled by their labor to supply their necessities, which recently they have been barely able to do, and secure themselves and families from starvation, ready to join as chorus singers in the tune of good times arranged and pitched by the men who have reduced them to the level of poverty and borders of distress, and who under the noise of the anthem which they have started anew, intend anew, to carry on the old process of concentration of values into their own hands.

With Mr. Paul, if I understand him, I believe we want more money to facilitate productive operations; but money, which originates from the Government, made of imperishable but cheap material, is the bravest, strongest money—better than gold and silver, which in times of danger, as at the beginning of the war of rebellion, shrinks away like a coward, and leaves the machinery of exchanges unlubricated.

Gold and silver are well enough in their way as articles of merchandise, as are other valuable metals; but as a basis of circulation have not one-tenth the value that the national credit backed, not only by the gold and silver, but by the entire wealth of the nation, would have as a basis of circulation.

I regret to differ with so intelligent and sincere a gentleman as Mr. Paul, and I am willing, in the long war for the rights of humanity still ahead of us, to take, as he seems to propose, any small advantages which may be secured, provided they are in the right direction; but this cry for "lively times" and the means to bring them about, means only another season of concentration of the real wealth of the world into still fewer handst; he breaking down of weak individuals, small partnerships, and pigmy and recent corporations, and mapping the wrecks of their fortunes into the hands of the stronger concerns.

Business being conducted on the principle of a *race*, the more racing we have the stronger the successful become, and the weaker and more discouraged, abject and servile, those who always come in second and last best, while this system, which has no basis of humanity underlying it, cannot be at once changed, and if it could be, a sudden change would not be wise. It is well for all to begin to understand that much that we complain of is caused by a system which has in it the elements of periodical distress, and ultimately, of unbearable oppression.

If a dozen children collected some afternoon to pull candy, and if after the product was completed three or four of them by virtue of superior prowess and assumption of skill and wisdom, should confiscate, by law, seven-eighths of the whole amount to themselves, it would fairly represent our boasted system of economy with its results on mankind; results which become more marked year after year, by a progressive ratio.

As in this children's work, there is now a system almost universally co-operative so far as production is concerned; but the distribution is like the handle of a jug, all on one side, determined by the sense of justice and selfish instincts of a few, and of course generally in their own interests.

Systemize co-operation under some general control—a co-operation of equitable distribution, as well as production, which latter is even now well-nigh general, and the vast map of economic troubles which at present are tossing the civilized world on the financial rack, will disappear to return nevermore.

Then, all the gold and silver dug from the eternal hills, will carry to humanity everywhere its blessings untrammeled and unalloyed.

W. N. GRISWOLD.

"Mineral Wax."

J. E. Clayton contributes to the *Engineering and Mining Journal* the following information concerning the "mineral wax" or ozokerite deposits of Utah:

The paraffine oil shales are found in the east flank of the Wahsatch range, the south flank of the Uintah range, and the west flank of the Colorado portion of the continental divide, or the Rocky Mountain range, especially that portion of it north of Grand river. These beds are probably Miocene Tertiary, and at one time undoubtedly covered the entire area of the great inland sea now known as the sandstone country of Utah, Colorado, Arizona, and New Mexico—a region about 400 miles in length from northwest to southeast, and 200 miles or more in width from northeast to southwest.

At the close of the Tertiary age, the elevation of the Wahsatch, Uintah, and Colorado ranges—especially that portion known as the San Juan mountains—gave a new outlet to the waters of this basin through what is now known as the Colorado canyon, one of the deepest gorges in the world. The vast flow of water during the "flood period" immediately following these great geological disturbances at the close of the Tertiary age—which, later on, merged into the Glacial epoch—gradually cut down this outlet, so as to drain out the entire basin. Then began the process of denuding the upper beds of the basin itself, by first cutting deep channels on the principal lines of drainage into the main outlet, and smaller ones later on, gradually extending back to the flanks of the surrounding mountains, until, at the present day, it is perhaps the most wonderful system of "box canyons" and deep gorges known on this continent or in the world.

Bituminous Shales.

The Tertiary shales have been swept away from all the central areas of the old basin; but in the higher plateaus along the flanks of the ranges, between the deep canyons, and even to the summit of the Wahsatch range in many places, these Tertiary oil shales are found covering large areas of country.

A peculiar feature of these oil shale beds is, that they are not equally rich in paraffine or wax. In some localities they are very thick, and rich in oil, but poor in paraffine, and the exudations along the flanks of the canyons are simply asphalt, with little or no paraffine. In other localities, the exudations are wax like and rich in paraffine; but I do not know of any locality where the wax exists in any considerable deposits. In all the localities that I have examined in the Wahsatch range, about the heads of Spanish Fork Canyon, and the heads of Price River (including White River and Fish Creek, its principal tributaries), the wax occurs as exudations from the shale-beds that have been cut by ravines so as to expose sections of the beds, or where they have been folded by the upheavals, and their edges exposed by denudation.

In studying the underlying as well as the overlying beds, I find, below the richest zone of shales, a series of compact beds, in places aggregating in thickness 100 feet or more, that are full of fresh-water fossils of the usual Tertiary type. The shells in some bands form the major part of the mass. The shaly portion is dark or blackish, in fresh fractures, and contains more or less oil. In some cases, thin splinters of it can be lighted with a match.

Overlying these fossil beds is a very fine clay shale with very few fossils in it, varying in thickness from 5 or 6 to 20 feet or more, which is very rich in oil, and, in some localities, rich in paraffine, both as impregnations and in very thin scales and films between the thin laminæ of the shales.

This upper bed of oil shale is remarkably tough. Weathered samples assume a grayish or brownish-gray color, and divide readily into thin sheets, and will warp in the sun like thin sheets of wood. There seems to be no sand or grit in them. One can saw them as readily as if they were boards. Above this is a continuation of what appears to be the same close-grained clay shale, of a dove color, many feet in thickness—say from 29 to 40 feet, but containing no oil or paraffine. The oil appears to have penetrated a few feet into this overlying clay shale from below, in some places impregnating it from 10 to 20 feet, while in other places not more than a foot or two.

Origin of the Ozokerite.

These facts seem to indicate that the oil is of animal origin from the underlying fossil beds above mentioned. Be that as it may, the facts are substantially as I have stated them.

Why these beds give crude oil and asphalt in some localities, and paraffine oils in other plac is a conundrum not yet answered. The h paraffine shales yet found are near the rim or ou edge of the old Tertiary lake or sea. He large lagoons or lakelets may have been fil with fresh water, and the vegetable slimes a mosses were sufficiently abundant to feed myriads of mollusca that became periodica entombed in the muddy ooze of the shall lakes or lagoons that were more or less isolat from the main body of water, thus giving m organic remains of the right sort in some loc ties than in others.

Ths facts seem to warrant the suggesti that the local conditions gave an abundant ty of organic life of the right kind in some plac while in other localities, the vegetable and a mal life produced oils almost destitute of par fine.

A careful investigation of the fossilifer beds underlying the different varieties of oil i pregnatious would throw some light on ths su ject. It might possibly reveal the true ori of all the fossil oils, as well as the causes th have produced the different varieties of oil the same zone of beds, only a few miles apa

Economic Values.

No deposits of "mineral wax" have be found in this old Tertiary basin, that equal richness or purity the ozokerite deposits of G licia in Austria. Such deposits may exist som where in this large stretch of the Tertiary be of the Rocky mountains; but they have not y been discovered. In the light of our prese knowledge, I am inclined to believe that t only way to get the paraffine in large quanti is to distill the shales on a large scale, by similar process to that now used in Scotlan The deposits of "wax" are small, and scatter over large areas of country. Hence, the colle tion of the impure varieties of ozokerite fou in Utah could not be relied upon to supply a considerable demand.

Systematic explorations by boring and othe wise may reveal rich deposits of the miner but this requires the employment of special sk and the expenditure of considerable sums money. All I can say about it now may summed up in this: That it is a promising fie for such explorations; but in my opinion, th distillation of the shales must be finally relie upon for the production of any large supply paraffine.

Dakota Coal Lands.

The following statement of the results of survey conducted by a party of the Unite States Geological Survey in the Great Sioux Reservation, Dakota, last summer, is made i answer to the many inquiries concerning th supposed deposits of that portion of th country.

The region west of the Missouri river, as fa as Slim Buttes, does not differ in general ap pearance from the settled portion east of th river. It is a plateau rising very gently wes ward, deeply cut by the valleys of the Gran Moreau and Cheyenne rivers and their tributa ries. This plateau is treeless and grassy, th monotony of its slightly undulating surface is ing broken only by scattered isolated butte from one to two hundred feet high. The large river valleys are a quarter to a half-mile wid with steep clay bluffs on either side, while th rivers flow in narrow cuts, with vertical bank ten to twenty feet high. Generally the wate is more or less alkaline, and occurs in the highe plateau only in water-holes. The soil of th plateaus for forty miles, and of the valleys fo 100 miles west of the Missouri, is of clay, vary ing in color from a dark bluish gray to blac "gumbo." Though essentially a clay soi throughout, west of this it becomes more sandy Timber occurs only in the cottonwood grove along the larger streams.

Coal.—Liguite occurs in thin beds of limite individual extent west of a line drawn from th forks of the Cannonball of the mouth of Cherr creek. It is possible that beds similar to thos mined at Sims, on the Northern Pacific R. R. may be found in the extreme northwest portion of the Sioux Reservation; such beds, if they ex ist, would furnish a poor domestic fuel for loca use. But within the area covered by the Geo logical Survey party—which includes the east ern part of the Fox Ridge—the geologist in charge found no coal of any kind serviceable fo domestic purposes, the lignite beds discovere being too thin and too dirty to produce a sal able fuel.

The area surveyed extends from the Missour river west to the Bismark territorial road, and from the Grand to the Moreau river. The geo logic formations carefully examined in this re gion extend south beyond the Cheyenne, and the observations apply to all other portions of the reservation south of it, including the Fox Hills. The reports of the existence of bitumi nous and anthracite coal in the Great Sioux Reservation are not borne out by the investiga tion conducted by the Geological Survey.—*Copps' Land Owner.*

THE Smelting Company engaged in leaching the tailings at Bullionville, Nevada, are doing very well. They are now working 12 ounce raw tailings up to 30 per cent, at a cost of $1.21 per ton. When the tailings are roasted which will be as soon as the company can erect a large Stedefelt furnace, Mr. Russell says that he will work them up to 80 per cent, putting through 175 tons daily, at a cost not to exceed $4.50 per ton. They have about 100,000 tons of tailings on hand.

MECHANICAL PROGRESS

American vs. English Machinery.

Mr. Arthur Rigg, C. E., one of the English engineers who visited this country last summer in company with the English scientists, is evidently a man of close observation, and one who is anxious not only to improve himself, but to impart instruction to his countrymen, from whatever source such information can be gained. Since his return, and at a meeting of the British Society of Engineers, held March 2d, 1885, he read a very lengthy and well written paper, giving in detail the result of his observations while in this country, and which appears in full in *Iron*, a leading mechanical publication printed in London.

It appears from this paper that nearly every branch of our manufacturing, and mechanical and mining industries was carefully studied by him, and his views are freely given. He saw but little to criticise, but much to commend. He was very decided in pointing out whatever improvements in method or manner of work he observed here, which he thought might be useful for adoption by his own countrymen.

In reference to the disinclination manifested by many to receive instruction or accept new ideas from foreign sources, Mr. Rigg uses the following words of wisdom:

"Some people seemed imbued with an idea that anything said in praise of either American or of foreign workmanship involves an unpatriotic distinction of what we produce at home. This is a very narrow view of things, for without having any sympathy with that cosmopolitan philanthropy which exalts every country at the expense of our own, it is plain that we can never indulge a generous ambition, nor aspire to lead the van of progress, if we shut our eyes wilfully to what goes on in the world around.

"There are no countries from which we can more fairly take example than those whose original habits came from this. America has been peopled by the more energetic of our own race, who now possess a country of marvellous internal resources. By the help of their laws, and to their enormous gain, new inventions are eagerly sought after, and talent meets great encouragement. There a man does not need to labor for many long years in perfecting an invention, taking the doubtful protection of those statutes of limitation called our Patent Laws, only at last to find his ideas appropriated by another—a pirate who takes undue advantage of the numerous pitfalls by which an inventor is encompassed. And for another reason, it is no wonder that foreign countries get ahead of us, when even their Governments wisely encourage every new departure, every improvement in existing methods. With them there is little of that nervous timidity about anything out of the beaten track, and none of that provoking interference due to the conceited half-knowledge of those who have learnt enough engineering to meddle with and spoil what they cannot understand.

"Abroad, engineers are more fully trusted than here, and they are therefore more free to obey the sound maxims—Make first sure of those general principles you intend to apply; then trust them implicitly; and, finally, never be afraid to carry them out."

We append in full his remarks in regard to the distinguishing characteristics of

American Machinery.

"The direct adaptation of tools to their intended purpose is very noticeable in all American machinery. In their planing machines, for example, everything is done to facilitate the attendant's labors by numerous little devices. The handles are arranged all ready for use; and, as the table runs quickly back, its catch strikes against an elastic lever, and so moves the narrow belt with the utmost quietness, and only about half the distance needed for an English machine. Then this action puts a friction pall into gear, and it deliberately advances the tool for another cut. The driving pulleys of these machines are ranged along the side, so they need not be placed across the line of main shafting as with ours, and, altogether, this one example might serve as text for a long dissertation upon the art of intelligent design, more particularly as contrasted with the clumsy planing machines which satisfy people here.

"Indeed, at one works the proprietor showed the writer an American machine for a different purpose, that was working well and with the utmost silence; while, not far away, was another doing corresponding work, and hearing the name of a large firm in this country. This latter was creating a deafening noise, and seemed as if concentrating its energies upon self-destruction every few minutes. A barbarous design, most appropriately named by its owner, as we left it, "Brute Force and Ignorance."

"In setting out manufacturing establishments of the best class in America, one cannot fail to notice that the object kept steadily in view is the need of cheap production with the disadvantage of expensive labor; and to this end the original first cost of machinery is considered of far less importance than any diminution of its productiveness, for that would be a continual drain upon profits. Settling the commercial aspects of any manufacturing concern may not lie strictly within the province of an engineer, but it ought to receive from him an amount of attention equal to its importance. That point where interest on first cost balances annual expenditure can be determined by very simple calculations, for if we assume capital all to be borrowed, and the machinery constantly in full work for fifty hours a week; and further, that a return of 10 per cent per annum just covers interest, repairs, and depreciation, then it follows that unless an investment gives more than 10 per cent it is not worth making. All excess over such interest becomes clear profit, and is frequently found enough to justify an opinion that no investment yields so high a return as first-rate machinery fully employed; and this is further illustrated by the old Lancashire saying that it is always worth investing $5,000 to save the annual cost of one man's labor.

"Those who commence doing everything which imperfect knowledge considers cheap are little aware how wide-spreading are the consequences of such an opinion being entertained by themselves and communicated to their workpeople. That idea not only saps the foundations of permanent success, but also poisons the springs of all honest dealing. It acts by the force of an evil example, and constantly depreciates the quality of manufactures. Many of our goods are already nearly driven out of foreign markets in spite of our immeasurable advantages, and are being replaced by the productions of America and foreign countries.

"If there is much to see and admire in Canada and the United States, there is nothing more worthy of imitation than the system which prevails there to so large an extent, of having the best of everything, whatever it may seem to cost—a system which ensures prosperity to trade, self-respect to the manufacturer, and one that is consonant not only with the sound principles of political economy, but also with ordinary common sense."

Cutting Steel Without Touching it with the Cutter.—We give herewith a new application of an old philosophical toy to a practical use. Make a disc of soft iron about 42 inches in diameter and three-eighths of an inch thick. Revolve this at a speed of 2,500 revolutions per minute. This gives a periphery speed of 25,000 feet. Against this edge a bar of steel, no matter how hard, may be brought and slowly turned. Care should be taken that contact does not take place, allowing "daylight" to be always visible between the disc and the steel; but the latter will be nevertheless cut by the soft iron. A stream of sparks is thrown off, which are hot enough to agglomerate as they gather in a small cone under the wheel. But like the glowing sparks thrown of from an emery wheel when grinding metal, these drops of apparently molten steel do not burn the hands, which may be held in the stream of steel sparks. A bar of steel two or three inches in diameter, whether rolled, polished or hardened, is cut through in a few minutes, and the operation does not heat it enough to draw its temper out.

Straightening Grate Bars.—It is stated by a correspondent of the *Scientific American* that ordinary grate bars, if not actually burned, can be brought back by heating the twisted portion to a very dull red, just enough to detect while in the fire; then nip the bar in a vise close enough to admit of its being shifted, bring a very gradual pressure on the other end with your hip, shifting the bar along so as not to take the warp all out at one place. The correspondent says that with one heat he has taken three or four inches out of a bar. A very little beyond the right heat will cause them to break like old cheese. The degree of heat and gradual pressure that twisted the bar without breaking is the remedy to bring it back. Judging from the tons of old grate bars which may seen about the foundries and old junk shops, it would appear that a very important saving might be made out of this new "shop wrinkle."

Power Wasted by Shafting Being Out of Line.—The amount of power wasted by shafting being out of line, badly lubricated, of insufficient size and imperfectly coupled, can hardly be estimated. Great as is this loss, that from badly laced, crooked, stiff, and generally outrageous belting is but little less. In some establishments a belt lacing of sufficient size for the main belt of the establishment is considered plenty good enough to lace a three-inch belt with, and is used accordingly. A punch large enough to make holes for the biggest lacing is, of course, necessary, and it has the advantage of answering for all sizes of belt: The apparent advantage of having but one size in a large establishment is captivating to the business department. The result in belt efficiency, however, is something which would astonish the coun ing house if it could be made to understand the figures—*Industrial American.*

Steel and Iron Girders.—Experiments on an extensive scale have been made by the Dutch Government to ascertain the relative strength of iron and steel girders. The soft steel girder proved to be 22 per cent and hard steel girder 66 per cent stronger than the iron girders. It was pretty well established that the strength of steel girders is about the same for the two flanges if they are made alike in section.

A good mechanic advises machine operators never to put resin on a new belt.

SCIENTIFIC PROGRESS.

The Grand Forces of Nature.—A grand exhibition of one of the levelling processes of inanimate nature was witnessed in the vicinity of the Homer group of mines, south wall of upper Mill Creek Canyon, on Friday afternoon of last week. Jasper Parrett, who is doing some work on the Homer group, was climbing the wall by the Homer trail, and had just emerged from the narrow gorge, through which the trail passes, about 1,700 feet up from the creek, when a great obtruding dyke of greenstone dropped from a beetling cliff nearly 2,000 feet above him, broke into huge blocks and came leaping and thundering down the nearly vertical declivity toward him. Mr. Parrett had barely time to escape over a field of compact snow clinging to the steep mountain side, and had the slide taken place while he was climbing through the steep and narrow gorge just below he must inevitably have been killed, as the flying mass raked both walls from end to end of the gorge. Some of the blocks, leaping several hundred feet down the mountain at a single jump, would strike upon a hard snow bank and hurl clouds of snow hundreds of feet into the air, and one block, which weighed perhaps not less than one hundred tons, ran clear down into Mill Creek, a distance of about 4,000 feet, or nearly one mile.

How Serpents Climb.—The movement of a snake in climbing a perpendicular surface, as I have observed, says a writer, is a vermicular, undulating motion, not spiral but straight up the face of the surface. I have seen a black snake thus glide up a beach tree with that easy, careless grace of movement which is characteristic of that snake when moving over horizontal surfaces. The bark of the beech affords few inequalities into which the edges of the gastrosegal hands could he thrust claw-fashion, and I have no doubt that atmospheric pressure is the force that holds the snake against such surfaces in climbing, sucker fashion, as the boy lifts the brick with the piece of wet leather. I once knew a black-snake to ascend a stucco wall to the eave of a carriage house to the swallows' nest; straight up the up-and-down boards. I have seen them glide from tree to tree and loop down near the top of large trees, but never saw one descend by climbing down a smooth perpendicular surface. I have no doubt of their ability to do so, however. I do not believe that this power is enjoyed by the copperhead or rattlesnake, or any venomous sort with which I am familiar, they being heavy and sluggish in their movements. I have seen them go up on leaning trees and crawl into the foliage of bushes, however.

Apparent Enlargement of the Sun and Moon.—Every one has noticed that the sun and moon, in rising or setting, appear unusually large. Paul Stroobant points out the absurdity of the vulgar explanation that intervening objects enable us better to estimate the real size of the heavenly bodies, in that the same effect is visible at sea, and indicates the fallacy of several other theories. He believes that there are two real causes of the phenomenon in question, both purely physiological—one, the greater sensitiveness of the eye to angular magnitudes near the horizon; the other, a direct effect of the feebler light in the enlargement of the pupil, which, it would appear, tends to magnify objects, even when artificially produced. His theories are supported with numerous illustrations and experiments, the most interesting of which are to show that the distance between two luminous points within a room suffers the same apparent change as in the constellations, when, without altering the distance from the eye, the altitude is gradually increased; and the maximum augmentation is estimated in either case as about one part in four.

The Denudation of the Two Americas.—T. Mellard Reade, C. E., F. G. S., in his presidential address to the Liverpool Geological Society this session, "On the Denudation of the Two Americas," showed that 150,000,000 tons of matter in solution are annually poured into the Gulf of Mexico by the Mississippi river; this, it was estimated, would reduce the time for the denudation of one foot of land over the whole basin—which time has hitherto been calculated solely from the matter in suspension—from 1 ft. in 6000 years to 1 ft. in 4500 years. Similar calculations were applied to the La Plata, the Amazone and the St. Lawrence. Mr. Reade arriving at the result that an average of 100 tons per square mile per annum are removed from the whole American continent. This agrees with results he previously arrived at from Europe, from which it was inferred that the whole of the land draining into the Atlantic ocean from America, Africa, Europe, and Asia contributes matter in solution which if reduced to rock at two tons to the cubic yard would equal one cubic mile every six years.

Chemistry now affords the means of giving to marble a beautiful coloring of yellow, without any injurious effect upon the polish or hardness of the stone. Neutral chloride of iron is first dissolved in 90 per cent of alcohol, and, after gently heating the marble to be colored in an oven or over a fire, the solution in question is applied by means of a brush, a sprinkler, or even by pouring. The strength of the solution is, of course, proportioned to the depth of the color desired, and care is requisite, also, in regard to the degree of temperature. For the production of light tints it is considered preferable to apply very diluted solutions repeatedly. On the marble becoming perfectly dry it is moistened with water or exposed to moist air when the decomposition of the salt of iron takes place in the upper strata and the process of coloration is complete, all that remains to be done being to polish the surface, if necessary, or it may be simply rubbed off with a wet cloth.

Leather from Fish Skins.—Mr. Jacob Trungenwalt, of Philadelphia, has discovered that catfish skins may be tanned into elegant and serviceable leather. His first experiment was on the skin of a fish weighing about 160 pounds. He has now been engaged in the business for several years and finds it very profitable. The leather is used for anything, from shoe laces to slippers, cabas, pocket-books and fancy pocket case covers, etc. The leather is light gray in color, very soft, and Mr. T. says "Tougher than the hide of a badger." This hide fair to prove another profitable way of disposing of these skins, which have heretofore been used principally for the manufacture of glue and isinglass.

The Effect of Cold on Tin.—It is stated in a recent number of the *Comptes Rendus* that, according to Herr Fritsche, tin exposed at St. Petersburgh last winter to a temperature of forty degrees below zero was converted into a semi-crystalline mass containing cavities like basalt. In masses of tin weighing from fifty-five to sixty-five pounds, these cavities in some cases had a volume amounting to nearly twenty-four cubic inches. According to M. Dumas, facts of this kind are not new in Russia; for instance, in one case the pipes of a church organ were so altered by the cold as to be no longer sonorous.

Weatherwise.—By observing and comparing the sounds emitted by a telephone connected by leads with two iron bars, stuck into the ground a few metres apart, it is possible to have an indication of the coming weather, sometimes ten or twenty hours in advance. So says Le Franklin. In case of a thunderstorm especially, a noise like that of shriveling leaves increases until a flash of lightning occurs, when it resembles that of rain or hail falling on glass.

Palpitation of the Heart.—A French physician announces that distressing or excessive palpitation of the heart can always be arrested by bending double, the head down and the hands hanging, so as to produce a temporary congestion of the upper portion of the body. In nearly every instance of nervous or anemic palpitation the heart immediately resumes its natural function. If the movements of respiration are arrested during this action, the effect is still more rapid.

The Skin of Insects.—The skin or outer cover of the insect consists of the cuticle, not comparable with any part of the skin of a vertebrate, and underlying tissues. The cuticle consists of two very distinct layers—one thick and transparent, the other, in which also pigment is developed, thin and opaque. The pigment is disposed in beautiful microscopic markings, differing in different species.

A New Alloy.—*La Nation* gives the formula of a new alloy which is especially adapted to many important uses in the arts. It melts at the low temperature of 160° Fahrenheit, or considerably below that at which the magical spoons of long ago melted in a cup of tea. Its composition is: Bismuth, 48; cadmium, 13; lead, 19; tin, 20. The alloy will withstand severe pressure.

The Old-Fashioned Way Becoming Obsolete.—In the manufacture of leather the old-fashioned bark tanning process seems to have died out, judging from the amount of extract used. Another substitute for the ordinary simple ingredients used in tanning has just been used in Germany. It consists of a mixture of soap, rape-oil, yolk of egg and sal-ammonia.

Attraction of the Moon.—M. Poincaire contends that the attraction of the moon modifies the intensity of gravitation. Hence at the equator the clock is retarded by half a second yearly by the combined attraction of the sun and moon, and advanced a second at the poles.

The Light emitted by insects, when examined under the spectroscope, is very beautiful, but is without bright or dark bands. When the intensity diminishes the red and orange rays disappear, and the spectrum is reduced to yellow and green rays.

Improved Insulation.—The latest discoveries render insulation so perfect that today there is less loss of electrical force between the United States and England than there was formerly between New York and Brooklyn.

Land and Water.—The total superficies of the seas in the world is given as 231,915,905 square miles, and that of all the continents and islands as 34,354,950 square miles.

Bromide of Silver an Explosive.—According to the *Comptes Rendus*, bromide of silver in contact with heat is an explosive.

SAN FRANCISCO:
Saturday Morning, April 4, 1885.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Fifteen-Inch Pump on the Gwynne's System—Double Suction, 217. Registering Apparatus for Mine Shafts; Steam Hammer for Light Work, 220.

EDITORIALS.—The Efficiency of Centrifugal Pumps; Metallurgical Works, 217. Passing Events; Iron Precipitation Process for Lead; American Machinery Still to the Front; Electric Railways; The Sutro Library, 220. Safety Indicator for Shafts; New Mexico Copper; Chinese Coal Mines; An Improved Steam Hammer; Coal Dust, 221.

CORRESPONDENCE.—Cannot Let the Mining Law Alone; Lively and Dull Times, 218.

MECHANICAL PROGRESS.—American vs. English Machinery; Cutting Steel Without Touching it with the Cutter; Straightening Grate Bars; Power Wasted by Shafting Being Out of Line, 219.

SCIENTIFIC PROGRESS.—The Grand Forces of Nature; How Serpents Climb; Apparent Enlargement of the Sun and Moon; The Denudation of the Two Americas; Chemistry; Leather from Fish Skins; The Effect of Cold on Tin; Weatherwise, 219.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 224-225.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 226.

USEFUL INFORMATION.—Silver Surfaced Iron; Manufacture of Liquid Gunpowder: Unburnt Brick; Why China is so Named; A New Paint; Bones and Horns for England; Soapstone Finish for Walls; A Soap Bubble Recipe; Liquid Hand Grenades, 223.

GOOD HEALTH.—Good Common Sense; A Dietetic Investigating Society; Healing Properties of Water; Prehistoric Dentistry; Inoculation of Tubercles, 223.

MISCELLANEOUS.—"Mineral Wax;" Dakota Coal Lands, 218. The Ore in the Black Hills of Dakota; American Engines for Egypt; Timbering of Mines; Assaying, 222 Recording Mining Claims; San Jacinto Tin Mine, 223.

Business Announcements.

Passing Events.

Reports came last week of rich gold strikes near Salt Lake City, but later advices from there do not confirm the richness. A few men are at work on their prospects, but there is no excitement.

The Wood River mining trouble continues. The men working in some of the mines have quit at the request of the Miners' Union. The mine superintendents, however, seem to remain firm, and insist that they will employ whom they wish at whatever wages they choose. Governor Curtis and General Brisbin have visited the mines to prevent trouble.

There is quite an excitement just now at the old Black Foot road, close to Helena, Montana, where several rich lodes have been found. The prospects are said to show up well. Some ground has even been taken up within the city limits of Helena.

A new trail is to be built from Weaverville, Trinity county, to the New River mines, which will make the time only one day between the two points. It is said the trip can even now be made from Weaverville easily.

Interest is now centered on the war news from Europe and Asia; and even nearer home there is trouble. In Guatemala Barrios is marshalling his forces, and at Panama revolutionists have seized on an American ship and officers.

ANTIMONY is selling in Liverpool at £39 to £40 per ton.

Iron-precipitation Process for Lead.

Whenever sulphur, arsenic, antimony and other electro-negative elements enter into the composition of a lead ore, we have to eliminate them before we can extract pure lead without difficulty. This is either done by precipitation by means of metallic iron or by roasting the ore. Of the latter method we spoke in this PRESS recently. The iron-precipitation process is only applicable to galena ores and lead ores contaminated with small quantities of the sulphides, arsenides and antimonies of other metals, to which should be added all sulphates, arseniates and antimoniates as they are reduced in the furnace to sulphides, arsenides, etc.

The process is based on the fact that iron has a greater affinity for the electro-negative elements than lead or silver. If, therefore, iron is brought in contact with molten sulphide of lead or silver it will, as soon as it has acquired the proper temperature, combine with the sulphur, while lead and silver are set free as reguline metals. The affinity of silver to sulphur is, however, stronger than that of lead, which is the reason why some sulphide of silver is undecomposed, remaining with the sulphide of iron.

The compound of iron and sulphur is metallurgically called a *matte*, while that of iron and arsenic or antimony is termed *speiss*. The latter has a higher specific gravity than the former, which is the reason why, if both are produced during the smelting operation, the matte floats on top of the speiss. The mattes retain more silver than the speisses, while with gold the case is exactly the reverse. Lead enters the speiss only in the metallic state in the form of shots, while in matte it will be present as a sulphide. Copper enters into either as sulphide and arsenide respectively, as it has a strong affinity for both sulphur and arsenic.

As it is not easy to obtain metallic iron in every locality, and as it is not generally in a proper shape for being weighed out and mixed accurately with ore and fluxes, it is preferable to supply the iron as a desulphurizer in its nascent state, in which it can be obtained by using a properly constructed furnace and working a slag of sufficient acidity, at the same time adding so much ferruginous matter to the smelting mixture as will correspond to the amount of metallic iron required for the saturation of sulphur, arsenic, etc. Basic slags are, according to O. H. Hahn, not good reducers, because they form at a temperature at which iron is not reduced; they will, therefore, merely mechanically dissolve the magnetic oxide which forms out of the additional ferruginous matter in the upper part of the furnace.

It may be inferred that this process is not a perfect one, because it gives rise to the formation of intermediate or by-products which contain gold, silver or lead. If thrown away these metals will be lost entirely. If we wish to extract them additional processes have to be resorted to, and the question then is, will it pay? It is, therefore, advisable to subject only such ores to the iron-precipitation process as contain a minimum of sulphur, etc. What the maximum should be can be determined by the local price of the iron flux compared with the cost of roasting.

American Machinery Still to the Front.

It is gratifying to know that although the first reports of American dredgers at work on the Panama Canal were detrimental to their reputation yet they have won their way, and against all foreign prejudice and opposition and have proved themselves far more effective than their costly and elaborate opponents, and are constantly at work, while the foreign machines are in the repair shop. These American machines were built in San Francisco, by the Golden State and Miners' Iron Works, after models which had been well tested in this State.

THE superintendents of mining companies at Wood River have peremptorily declined to hold any conference with the committee from the Miners' Union, stating emphatically that they will submit to no dictation as to how they shall conduct their business; that they will employ whom they please and pay such wages as they can agree upon with men whom they employ.

THE daily average amount of ore shipped from Gold Hill to the mills on the Carson river is 640 tons.

Electric Railways.

It is expected that in about a month preparations will have been completed by the elevated roads of New York for a test of electric locomotion on the Second avenue line. A central line will be laid between the rails from Chatham Square to the Harlem river terminus, to which electricity will be conducted from dynamos. This rail will be insulated, the present tracks remaining as they are. The expense of building the third rail will be divided among the electric railway companies, all of whom will be allowed equal facilities for experiments with the motors. A commission is to be selected by the companies to decide on the relative merits of the inventions, and after their decision a company will be formed to control all the patents for the several companies for this country, and for these rights each company will receive stock in the new company in proportion to the value of the property and patent rights conveyed by it. It is claimed that the regulation of the speed of trains will be less difficult with electricity than with steam, and that the trains can be stopped more quickly and be at all times under more perfect control. The noise will be less and the smoke and cinders will be avoided altogether.

The motors of the whole track will be under the control of one person, and the system will permit the trains to be of any desired length. Five cars can be controlled as easily as one. Air brakes will be used instead of the steam brakes now employed on the elevated railways, and there will be advantages in many ways. The distribution of the weight of the motive power will be an important one. The steam locomotives of the Manhattan Company weigh about 18 tons, but the new motors will increase the weight of each car perhaps not more than one ton, thus saving 14 tons of dead weight for each train. The new motors will weigh about eight tons. Its driving wheels will be four feet. The motor will be about twelve feet long and nine feet high. It will move an elevated train of four well-filled cars at any desired rate of speed.

In San Francisco, too, plans are being arranged for an electric railroad. Very shortly an experimental one, being built by the Pacific Coast Electrical Construction Co., will be running from the Southern Pacific R. R. depot to the new Union Iron Works, on the Potrero. It will be for both freight and passengers. This company is perfecting plans for more extended roads, as we remarked in an article a few weeks since: "The road is to be constructed in a manner exactly similar to the method of building cable roads, and the cars and dummies will also be similar to those on the cable lines. The power will be distributed from a central station, where the electricity will be generated by steam power. Underneath each track in a conduit will be a positive and a negative wire, through which will run a current of electricity from the generating machine. The lever of the dummy will have two arms below the track, and at the end of each arm will be a grip, which, when the car is in motion, will grasp the conducting wires, thereby closing the circuit. As soon as the car stops these grips will be lifted from the conducting wires, the circuit broken, and just so much energy as is necessary to propel a car thus be saved. The generating machine will be so arranged with cut-off and other appliances that as soon as a car stops the machine will cease to generate the amount of electricity necessary to propel one car. By this method if by a procession or any other cause the line is blockaded and half the cars are stopped, the generating machine will run at only half its usual capacity. The company claims that it can build its road for 40 per cent less cost than a cable road and run its cars 40 per cent cheaper.

Electric railroads similar to those proposed for this city have been in successful operation for over two years in Frankfort and Berlin, Germany, and for over a year at a place in Ireland, at Coney Island, at Menlo Park, N. J., and at Saratoga, N. Y.

THE Candelaria miners have called a meeting to consider the proposition of employing a competent physician and surgeon on the assessment plan. The idea is an excellent one, and its practical application would cause greater security to the safety of all in case of sickness or accident.

The Sutro Library.

Mr. Adolph Sutro, well-known to all mining men as the originator of the famous tunnel in Nevada, which bears his name, is engaged in a work which will perpetuate his name better than any monument would do, since practical results will follow. He is founding an immense library, which he will present to the city of San Francisco. We had an opportunity last week of examining the nucleus of the library, which is temporarily arranged at 107 Battery street. The library is intended to be mainly technical and scientific. The books so far here amount to between 60,000 and 70,000, while enough more are now on the way to make up a total of 150,000 volumes.

About a year ago Mr. Sutro was in Wurtemburg, when the Buxheim library was being sold. Buxheim is a little town, principally remarkable for its monastery founded in A. D. 1200, the monastery in its turn being noteworthy for its library of old and rare books. The library fell into the hands of Count Bassenheim, a spendthrift; the Count had to sell the library, or a bank sold it for him, and Adolph Sutro bought the bulk of it. Again Mr. Sutro was in Munich when the State library was being cleared of its duplicates, seized the opportunity and bought them. Within a comparatively short time he was in England when the sale of the Blenheim library was announced. He attended and bought many of the treasures there disposed of. Almost contemporaneously with this came the sale in London of Dr. Charles Clay's collection of Bibles and Sutro bought the entire accumulation of the eminent bibliophile. Beside himself purchasing at many other places in Europe, he has agents engaged in the same work.

A large portion of the books now here are very old and rare ones, culled from many libraries. Rare and curious editions, ancient manuscripts, old proclamations and edicts, illuminated missals, files of ancient journals, odd bindings, collections of autographs,—in fact everything is there to rejoice the lover of books. It would be idle to even attempt to enumerate a portion of the collection. The collection of Bibles is very full and curious, as many rare editions are seen.

Mr. Sutro's object in collecting these old books is to have a basis on which to build up complete sets on given subjects. More modern works can be obtained later, but such as he has now are more difficult to get. The collection is a wonderfully curious one, and months could be spent in merely looking at title pages, illustrations and bindings.

When completed the library will be one of great scientific value, as reference and text books on the various subjects will all be grouped. For instance, Mr. Sutro informed the writer that he had specially looked out for works on mining and metallurgy and had procured many rare ones. He will add those of modern times, and eventually have a complete and full group of mining books of every kind, which will show the advance of the industry from earliest times. The same is the case with botany and other branches of science; music, political economy, etc.

It is Mr. Sutro's intention to build in this city a large fire-proof building in which this vast collection of books will be stored for the benefit of the public. The present quarters are already filled, and as many more books have also been bought. His agents are constantly purchasing, and before long a most magnificent library will be the result. All lovers of rare books will be gratified to learn that arrangements are being made as rapidly as possible to place the books in a position for reference. Not even the famous Astor library of New York will afford such opportunities for scientific or historical research as will this one now being formed.

A STEEL STEAMER.—On Thursday of this week the first steel vessel ever built on this coast was launched at the Potrero. She was built by the Union Iron Works at their new ship-yard and shops. The launch occurs too late for us to give any description of it in this issue and it will appear next week. An interesting feature of the occasion was the placing of the engines in the vessel immediately after the launch; the new steam crane being used for the purpose. The whole thing was very successfully accomplished, and there was a very large attendance of representative citizens.

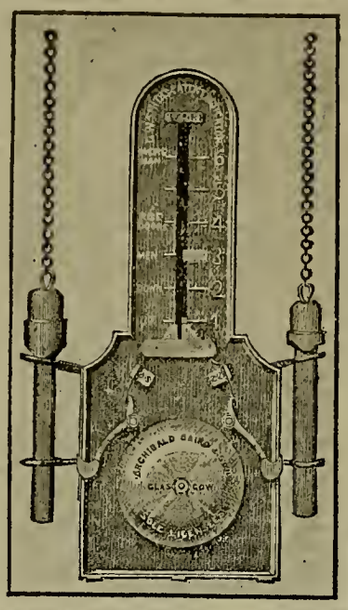
Safety Indicator for Shafts.

A new form of safety indicator for mining shafts has been brought out in England, which possesses the peculiarity of combining both a visible and audible signal with a safety guard for pit bottoms. The object of the indicator is to provide a safer and more effectual method of signalling between the "bottomer" and the engineer than at present in use, and at the same time ensure the entrance to the shaft being closed while the cage is in motion. The indicator consists of an iron frame about 33 inches high, fitted with a clear-rounding gong and hammers. An index pointer showing red, is lifted up to a corresponding number of bells rung by means of the ordinary pit-bottom lever.

The engraving of the appliance we take from the *Colliery Guardian*. When the "hutch" or "tub" is on the cage, and the protection bar or gate is put down at the pit bottom, the red danger signal of the indicator drops, and leaves behind a white signal at the same figure, a bell being rung by the same movement is the signal to "lift." After the work has been performed, and the opposite cage has descended, the act of raising the protection bar or gate to take off the return hutch or tub allows the white index to drop behind the red one. In short, when the pit is open and unprotected, the red signal is against the engineman, when the pit is closed and protected the red or danger signal is off, and the white signal shown at the required number. The whole work is done by the "bottomer," who has the indicator under his control. The following are a few of the advantages the indicator possesses: (1.) Only one distinct signal can be given at a time. (2.) The rising of the red signal with the simultaneous ringing of the gong shows the work to be done; the dropping of the red and "one bell" sounded, the time for doing it. (3.) Should two or more seams open into one shaft, and any protection bar or gate be accidentally left open, no signal to "lift" can be given till all the bars are down and the pit secured—it is a locking signal. (4.) Should any accident occur from wrong winding, the white index stands as an evidence against the man who made or read the signal wrongly.

The arrangements on the surface consist of the indicator erected in the engine-room, on a stand about three and a half feet high, as nearly as practicable in front of the engineman, the indicator being screwed down to stand and iron rests erected on each side. Into the rafters of the engine-house a six-inch pulley is screwed directly over each eye, at the side of indicator; the indicator weights are connected by light chains, which pass over the pulleys; and are connected with wiree from the pit-head hammers or cranks. The tongues on the pit-head hammers or cranks are fixed below the bare, and on the weighted side of the fulcrums or centres; the signal wire from the ordinary signalling lever at the pit bottom is connected with the weight on the left hand side of the indicator (looking at it from the front) the protector bar wire being connected with the weight on the right hand side. The stroke or travel of both weights must be the full space of the slots in side standards, and require regulating from time to time, till the wires are thoroughly stretched. The right hand weight is kept full down while working left one. When the fittings at the pit-bottom, hereafter described, are erected, the pit-head fittings above described are regulated by (1) holding up the "protection" bar hammer; and (2) working the signalling crank or hammer up and down. The loose wire, etc., are adjusted before working signals from the bottom—the "protection" bar crank or hammer is always up before a signal can be given, and when put down it cancels the signal.

The arrangements underground consists of "protection" bars of one and a half inch steam tubing placed across the various openings leading into the shaft. "Protection" bars work in hardwood journals, secured on the mid-wall side of the shaft; the ends of the bars project beyond the journal, and are turned up on one end, and fitted with a muzzle to take the wire. With glands in center of bar a circular disc of sheet iron, ten inches in diameter is fastened as a danger signal, and it is preferable to paint the whole a bright red. A light chain is attached to the disc, and passed over a pulley, weighted sufficiently to assist in raising the lever. A hook is in to hold bar up when required. The "protection" bar falls when relieved to horizontal position. Where gates already exist at entrance to shaft the protection wire should be connected to it in same manner as for a bar. The muzzle on end of all the "protection" bars in the shaft should be connected by a branch wire to the main wire; only one wire is required the whole way up the shaft for any number of "protection" bars or gates. The bars should be placed high enough to stop a hutch or tub, and rest on blocks when down.



Registering Apparatus for Mine Shafts.

The following are directions for working. Signals can only be given by observing the following order:

Signal at bottom,	Result in engine room.
First, Lift up "protection" bar	Cancels last signal made.
Second, Signal message..	Danger signal up at number
Third, Put down "protection" bar.	Danger signal off—white one at number

and so on, keeping this order in signalling. When "pit" is open "danger" signal is exposed. As engineman won't "lift" till "danger" signal is off, all bars must be down before the cage leaves the bottom. To disconnect indicator lift both weights out of eyes of indicator and secure them. Written or printed instructions should be posted at each bottom or engine-room, as follows:

Instructions to Engineers.—When pit bottom is open red or "danger" signal is shown. When white is shown, bottom is protected. Dropping the red is the signal to "lift." The index pointer should correspond with the number of bells rung. The white index registers the signal till the work is done. To stop the cage after starting, the bottomer signals one, and then makee new signal.

Instructions to Bottomers. — "Protection" bar *must be up* when signal is made. Putting down "protection" bar drops the "danger" signal, and is signal to lift. All bars in all seams must be down before signal to lift can be given. To stop the cage, signal ons with bar down, then raise bar and make new signal.

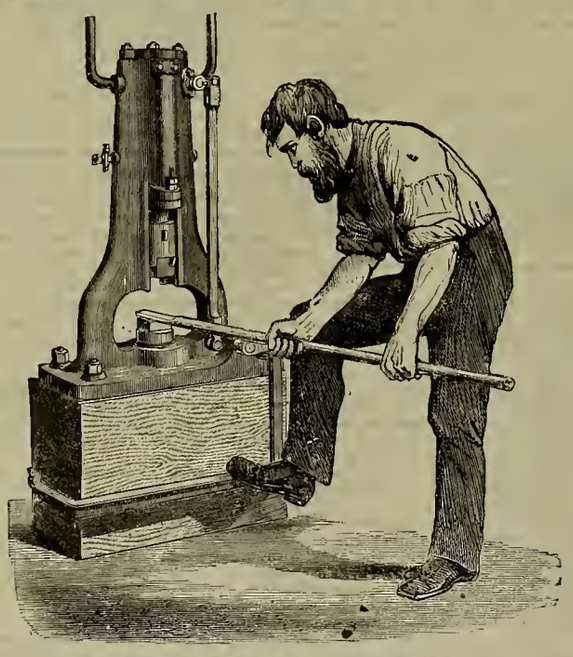
New Mexico Copper.

In New Mexico copper occurs abundantly in many counties. For years the Mexicans and Indians have brought very rich specimens of copper ore from the Jemez and Nacimiento mountains. It was known that there was a rich body of mineral there somewhere, but no systematic effort was made to discover it until 1880. A fine property was found on the west side of the Nacimiento mountains. The copper occurs as copper glance and gray copper in the ledges of sandstone. A small amount of silver is found with the copper on the surface, and seems to increase with the depth. The Nacimiento company now own over a dozen claims, on all of which large deposits are found. At a distance of 50 feet from the surface a large vein of conglomerate, 12 feet wide, averaging 25 per cent copper, was struck. The Copper Queen shows a smaller vein, but is much richer. It runs over 50 per cent, and parts of it as high as 60 per cent. In all of these mines there is ore that will run 40 per cent copper.

The Santa Rita copper mines are five miles from Fort Bayard, which lies between the town of Central City and the copper mines. The Santa Rita mines are peculiar. They are not veins or lodes. In sinking a shaft the miner meets with veins or sheets of native copper, from one-eighth to two inches thick all through the rock. Sometimes nuggets or boulders are found.

Chinese Coal Mines.

The Chinese are laying aside their prejudices in a new direction, and intend to work their coal mines in a systematic manner, with the most experienced European miners. The Chinese Government has applied to the great John Cockrell Co. for 30 miners to superintend the extensive collieries which they propose to open up in certain of the rich deposits already "prospected." Very liberal salaries have been offered, and the appointments have been eagerly accepted. These 30 miners thus officially engaged are likely to be followed by another 30, who will proceed to China on the chance of obtaiuing an engagement on their arrival. As the former will probably be glad to avail themselves of European aid, there is hardly a doubt that the latter will speedily obtain the appointments they desire. It is probable also that the Chinese will obtain a plant of the necessary machinery to work their mines properly. But they will soon learn the ways of the "outside barbarians," and in opening up these other mines will adopt the system they learn and not call in the aid of Europeans. In this the Chinese are very expert. Our experience with them is that they learn things readily, and then conduct matters themselves, the trade or occupation once learned. There are large deposits of coal in China, and with the assistance referred to they will very quickly be developed so as to be of more importance than heretofore.



STEAM HAMMER FOR LIGHT WORK.

An Improved Steam Hammer.

The accompanying illustration represents a class of steam hammers now imported by H. P. Gregory & Co., Nos. 2 and 4 California street, S. F. They have in stock constantly two sizes, viz., the 55 lb hammer, which is now being used on this coast in welding up iron to 2¼" in diameter; and the 110-lb hammer, which is equal to work 3" and over. They are built entirely of iron and steel; the blows can be varied in strength and speed at the will of the operator. No attendant is required in their use other than the forgeman, the valves being operated by a treadle.

The utility of steam hammers is recognized, but the general impression exists that it is only large establishments, or those establishments doing heavy work, that can make them profitable. This idea has probably arisen from the fact that steam hammers have from the first, until very lately, been of the heavy order, and necessarily expensive in their first cost; this objection is now met by the manufacture of these 55-lb and 110-lb hammers. They take little space; prices are within reach of all, and their adaptation to every form of work complete.

Their uses are applicable to the lightest description of forgings, such as are usually made by hand, as well as for heavier work. In consequence of the almost endless variety of purposes to which they are adapted, these steam hammers are economical even in the smallest shops with only a single fire, and indeed none can afford to be without one. The principal advantages derived are:

First. A great saving in wages, as one smith with a steam hammer can do as much as two or three without it, and for these sizes he will need no assistant, as the hammers are worked by the foot.

Second. Great economy in fuel, as at one heating of the iron so much more can be done than is possible by hand.

Third. Economy in iron, since scraps, old shafts, etc., which commonly are almost useless, can be worked up into forgings of the very best quality.

Fourth. The forgings are more accurately finished, and require less labor in fitting and turning than is possible to attain by hand work.

In many cases the saving by the use of these steam hammers amounts to fully 50 per cent, defraying the cost of the hammer in a few months.

These hammers are all tested before leaving the manufactory, so that no difficulty is experienced in starting them.

The weight given, and by which the hammer is designated, does not include the pressure of steam upon the piston, but only the weight of the tup and piston. The blow given will vary from the lightest tap to from five to ten times the weight of those parts which would be equal to a pressure of 100 times the same weight. In another issue we will illustrate some of the larger hammers of the same manufacture.

Coal Dust.

Recent scientific investigations by the Prussian Firedamp Commission, in inquiring into the causes of explosions in mines, have developed some very interesting facts. Among other things they find that many explosions attributed to firedamp, or outbursts of gas, are really due to the fine coal dust in the mines. It appears that all kinds of dust are capable of exploding violently when ignited by such means as the electric spark; and second, that the explosion extends much further with coal dust than with firedamp. We are told that every kind of coal dust was tried, not excepting schist even; that the tests were many times repeated, more than two hundred times in all; and that explosion occurred in every case. The German Commissioners found no such limits as fifty yards, and no such mild phenomenon as a simple "tongue of flame." The results they have obtained bring a valuable addition to our stock of knowledge, and enable us to explain many accidents given up as inexplicable. There is no longer need to assume in every case a sudden irruption or "gaseous emanations." The ubiquitous dust might have been the sole agent of destruction, and henceforth these floating particles of carbonaceous matter must be regarded as a foe to be combatted scarcely less potent than the firedamp itself. The discovery is both alarming and re-assuring. It is in a high degree disquieting to call to mind the license allowed in dusty workings in the matters of lighting and shot-firing.

The experiments relative to the inflammability of coal dust were made at the Koenig Mine at Neunkirchen, Sarrebruck, and were devised as nearly as possible in accordance with the conditions prevailing in practice. A gallery or drift driven from the surface was chosen as the place wherein to treat the dust, and means were provided to keep the particles in a state of violent agitation by currents of air. To provoke ignition of the dust, the electric spark was made use of, a means which is far from furnishing that volume of flame the French experimentere found to be necessary to explode coal dust.

Tin Ore in the Black Hills of Dakota.

The following paper was read by William P. Blake, New Haven, before the American Institute of Mining Engineers: The discovery of tin ore in the Black Hills of Dakota dates from June, 1883, and short preliminary notices were published in September of that year. The discovery-point is known as the Etta Mine, in the central portion of the Hills, about six miles east of Harney Peak, and twenty from Rapid City. The Etta was located for mica. It is a granitic mass, rising in the midst of fine-grained micaceous and arenaceous slates, which resemble the Coos group of the White Mountain formations of New Hampshire. Some portions of these slates are highly garnetiferous; other portions contain staurotide; and in some places there is a large development of sandstones of regular stratification, in thick beds, which form prominent ridges. These sandstones are compact and solid, and possess a bluish-gray color, due to protoxide of iron. They are in the condition of quartzites, and they indicate shallow seas on the borders of some continental or extensive shores in that remote period of the world's history.

There is a singular absence of limestone strata and of magnesian rocks in these old formations. Hornblendic slates and syenitic rocks are also rare. Granite, in the form of bosses, and (nearer to the Harney Peak range) in long dikes is common. But at the Etta, and in its vicinity, the granitic masses are columnar, rather than tabular, in form. The Etta outcrop is nearly circular, in horizontal section, measuring about 200 feet in its longest diameter, and 100 to 150 feet in its transverse diameter across the outcrop.

The line of demarcation between this granite mass and the slates is sharp and distinct; and where the contact is opened to view by the lower tunnel, there is a clay selvage making a distinct wall, as in regular veins. This mass, like most of the similarly-formed granitic masses of the region, is characterized by extremely coarse, massive crystallization of the constituent minerals. Slabs of pure feldspar, from twelve to twenty inches in length may be frequently seen, and masses of white quartz, several feet thick and nearly pure, are abundant.

Structure of the Etta Vein.

The outcrop and the whole columnar mass have a rudely concentric structure; the outer portions, next to the country rock, being characterized by a band or belt of dark-colored mica, alternating in places with muscovite in large plates. This is succeeded by massive quartz, with irregular bunches of massive albite and of orthoclase (feldspar, together with enormous crystals of spodumene and irregular bunches of a dense aggregation of small crystals of mica and albite, forming a kind of greisen-rock, an albitic greisen, in which cassiterite is abundantly disseminated in small grains and partly-formed crystals.

Percentage of Black Tin in the Ore.

The mineralization is remarkably even. The masses of greisen are rarely without the black grains of cassiterite sprinkled through the mass. The percentage of black tin is not yet ascertained by working in a mill in the large way; but average samples show that it is about 2½ per cent. Hand-samples of selected rock will yield as high as 6 per cent. The result originally obtained by sampling the outcrops was 3 per cent. A sample lot of two tons of greisen-rock ore sent to New York, and there worked, yielded between 3 and 4 per cent. of concentrate—black tin of high grade—some of which, smelted by Mr. Riotte, at the New York Metallurgical Works, gave a number of 25-pound bars of excellent tin.

These percentages are, of course, independent of the massive cassiterite, of which some hundredweights have been found outside the greisen-rock. This occurrence is exceptional; but more may, at any time, be brought to light by the excavations.

The percentage of black tin in the ore compares favorably with that found in the ore of other tin regions.

The general average percentage of black tin of six large mines upon the great flat lode of Redruth, Cornwall, in 1876, was 2 22-100; and less than this has been worked with profit in some places.

Minerals Associated With the Tin Ore.

The mineralogical association of the tinores at the Etta and other places in the Black Hills, appears to be very similar to that observed in other tin regions. As a general rule, mica is the most common associate. This is the mineral with which the cassiterite is most directly and closely connected. Albite may be mentioned as next in intimate relationship, while in some of the veins—notably in the Hill City district—quartz is the pervading gangue of veinstone. At the Etta, also, spodumene, rich in lithia, is a close associate, and occassionally cassiterite is found in the midst of the massive crystals. This association of spodumene with tin stone is common in several of the granite masses in Maine, and was brought to my attention by Mrs. Ellen Richards, or the Massachusetts Institute of Technology (one of our members). I am not aware that this paragenesis has been observed abroad.

The absence of topaz, so far as yet known, is a little peculiar. Beryl, which is common in the Black Hills in other granitic masses, has not yet been recognized as present with the tin-ore. The same may be said of tourmaline, which is very abundant in some of the granitic dikes, and especially in the great cliffs of Harney Peak and its vicinity, yet does not occur to any noticeable degree in the Etta; and where it does occur, so far as yet ascertained, tin is absent. An exception may be noted in the Boh Ingersoll dike, where indicolite, a beautiful blue tourmaline, is abundantly entangled with muscovite mica in large plates; but it is not in direct association with the tin ore, which is enclosed in albite. This species, tourmaline, is generally enumerated as one of the associates of tin stone; but my observations in the Black Hills lead to the belief that it is not so, thus confirming the observations of Lodin upon the tin-bearing veins of Villeder and Morbihan, France, described in his paper recently presented to the Geological Society of France, which notes the fact that tourmaline, though abundant in the region, is not found in close relationship with the cassiterite.

In addition to the minerals already mentioned as found with the tin stone at the Etta mine, the following should be mentioned:

Apatite, tripbylins, beterosite, leucopyrits (or rather a stanniferous arsenical iron, requiring furtber examination), tantalite, or columbite, a small quantity of vitreous copper (the only sulphide seen), and a few secondary oxidized species, due to ths surface-decomposition of the arsenical compound and the copper sulphide.

The associates of cassiterite in New South Wales, according to Professor Liversidge, are quartz, mica, otboclase feldspar, fluorspar, molybdenite, garnet, beryl and topaz; also, mispickel and tourmaline. Wolfram does not occur in the same veins with the tin, but is in other veins almost in juxtaposition. This association is not unlike that found in Dakota, with the exception of fluorspar, topaz and molybdenite, which have not yet been recognized. Wolfram has not yet been found with the tin ore, though it occurs in the region.

Extent of the Tin Region.

There are now three well-defined districts of tin-bearing lodes in the Dakota portion of the Black Hills:

1. On the east side of the Harney range, at the Etta, Ingersoll, Monarch, Peerless and other claims.

2. Near the summit, at Bismarck's rancho, where cassiterite occurs in several narrow veins of quartz.

3. At Hill City, on the western side of the Harney range, where there are both granitic veins and quartz veins bearing tin ore.

To these we may add mention of a tin district in the Wyoming portion of the Black Hills, about 20 miles west of Deadwood, where a considerable amount of stream tin has been washed out of the bed of Sand creek, and the discovery of the ore in place in granitic veins is reported.

In ths Hill City district, the cassiterite is generally in crystalline hunches or masses in the midst of quartz, together with a bordering mass of mica in close compact crystals, frequently forming sheets of mica crystals in the midst of the quartz, parallel with the walls. It is rare that any other minerals are found in these veins. In the granitic veins the grains of cassiterite are smaller, blacker and more crystalline than in the quartz veins.

Contemporaneous Origin of the Ore and Rock.

In the numerous tin-veins and tin ore-bearing granitic dikes of the Black Hills tin region, the phenomena of occurrence and association indicate that of all the minerals of the dikes—the quartz, feldspar, spodumene, mica, beryl, columbite, tantalite, phosphates and other associates of the cassiterite, were contemporaneous in origin. The tin-stone is apparently as much a part of the mass as the mica or quartz. It was, to all appearance, present when the whole mass assumed its crystallization. All the constituents of the dike appear to have crystallized from a semi-fluid or pasty magma, in which the elements were free to arrange themselves from one side of the dike to the other and to crystallize out slowly. This is indicated in several ways, but strikingly by the gigantic crystals of spodumene stretching across the mass at the Etta, in straight lines, for 20 to 40 feet, in the midst of quartz, feldspar and tin ore.

The aggregation is totally unlike that seen in narrow fissures, filled gradually by the flow of solutions depositing layer after layer on each side, until the fissures were gradually filled up. In the granitic dike, or intrusion, or segregation, of the Etta, and other places where tin occurs, the rude concentric or parallel structure seems rather to be due entirely to the different conditions of pressure or temperature next to the walls while the fissure was full of the unsolidified constituents of the lode or the dike. There are no signs of infiltration or of alteration or of replacement, in a secondary way, of the minerals by the tin stone, which, in all cases, would appear to have been one of the original constituents of the granite, as much so as any of the other earthy minerals. So far, also, as yet seen, there is nothing to sustain the views expressed by Dr. Le Neve Foster, that the tin-stone of Cornwall, at least, is the result of the infiltration of solutions depositing it in the granite adjacent to fissures, and partly replacing and altering the minerals of the granite.

It is also difficult to find in the conditions observed in Dakota a full confirmation of the theory of Daubree, which supposes that cassiterite results from the decomposition of volatile fluorides or chlorides of tin. The usual association of cassiterite with minerals of which flonring is a constituent, is considered an evidence of this. But in Dakota such conditions are not prominent.

American Engines for Egypt.

In a recent number of ths PRESS we referred to the feeling which had been created in England over the contract by the Government with an American firm of pump manufacturers, to supply the pumping engines for the supply of water in the pipe line system to the British troops about to traverse the desert in Egypt. In this country the contract gave great satisfaction, inasmuch as coming from such a source it was particularly a tribute to American skill and scientific advancement. From a member of the firm of Henry R. Worthington (who have the contract) the New York *Commercial Bulletin* learned that the necessities of such a perilous journey had been considered by them as far back as last fall, and proposals and estimates had been submitted months ago by their London house to the British Government. Expediency alone had not induced the English Government to award them the contract; the special facilities they had for producing precisely the class of work required were perhaps quite as important factors to he considered. About 20 engines would have to be sent. One was already on the way, three or four more would leave in a week or so, and the whole contract be completed within three weeks. The engines are from 150 to 200 horse-power. Skilled hands were at work night and day. The journey for troops from Cairo to Berber by way of the Nile is about 1,200 miles. From Suakim to Berber in a direct line across the desert, the distance is not more than 260 miles. But the absence of water makes the journey an impossibility for large bodies of troops. Even a railroad would be difficult to maintain, owing to the need of large quantities of water for the engines and for the guards along the road. Water must be had at any cost. The plan now adopted is to run two four-inch pipes over the whole distance. Every 30 miles or so will be a tank and two engines, with a capacity for forcing water along at a pressure of 2,000 pounds to the square inch. Two pumps are used in case of accident to one. In forcing oil from the oil fields to the sea-board they have to cross mountains, and the work is tremendous compared to running water along a level surface. The pumping engines to be used are about 15 feet long, and require from 150 to 200 horse-power of steam. The pumps will deliver water at the end of the route at the rate of about 150 gallons a minute.

Timbering of Mines.

A writer in the *Colliery Guardian* gives some of the rules of the colliery with which he is connected, and which have worked well in preventing accidents from imperfect timbering. The two special rules are as follows:

"1. It is the duty of each hewer to attend to the safe timbering of the place in which he works; for which purpose he will at all times be supplied with a sufficient quantity of timber; and if from any cause he is unable to make such working-place secure, he is to discontinue working and give immediate notice to the overman.

"2. In 'benching' or 'holing' the coal the hewers are to work under the direction of the overman, and set a sufficent number of sprags to keep the coal up, until the benching or holing is completed and the coal let down with safety.

"I am pleased to say that under this system of working we have not had a fatal accident by a fall of coal or roof in a working place for twenty-four years, though we have raised about 2,750,000 tons of coal, and this with a roof—on one seam in particular—which the late Mr. Brough, inspector of mines, characterised as one of the worst he had ever seen. The only fatal accident from a fall of roof during the period referred to was in a main road, where a portion of the roof, loosened by shot-firing, fell and caused a man's death. This system of timbering prevails generally throughout this district, with fairly equal results."

INDIANS AND MINES.—The Shasta *Democrat* says: That the noble red man is not slow in "catching onto" the little games and sharp tricks of his more civilized white brother was illustrated a few days ago on Squaw creek. An Indian brought one of the miners of that region a magnificent specimen of silver-lead ore assaying $400 per ton, and told the miner that he had discovered a ledge of the same kind of material 15 feet in width, and that for a small consideration he would guide him to the locality of the find. The miner didn't bite, but instituted inquiries on his own hook, which resulted in the discovery that the cunning descendant of the first families of the Sierras had found the specimen at Delta in a box-car formerly used for transporting Arizona ores to San Francisco. Who says the Indian ain't improving and advancing in civilization?

Assaying.

Determination of Chrome Ores and Minerals.

Chromic iron is valued for the percentage of the sesquioxide of chromium it contains. The assay is simple. Chromic iron is, however, extremely difficult to wholly decompose, which must be effected before a perfect assay or analysis can be made.

The following method is given by Fresenius: The ore must first be extremely finely divided by triturating in small portions in an agate mortar, or in a large way by bolting. For the assay, fuse eight parts, by weight, of borax in a platinum crucible; add to the mass while in fusion one part of the pulverized ore, and keep the crucible for half an hour at a bright-red heat; add dry carbonate of soda as long as it causes effervescence. Then gradually, and with frequent stirring with a plantinum wire, add three parts of a mixture of equal parts of nitrate of potash and carbonate of soda, and keep the mass for a few minutes in fusion. When cold, dissolve in distilled water with heat, and filter. The residue which remains on the filter must wholly dissolve in hydrochloric acid, or the decomposition has not been successful, and the operation must be repeated with more care. The chromic acid, in the yellow aqueous solution, is thrown down by a solution of nitrate of mercury and the precipitated chromate of mercury, well washed and dried. When calcined, the volatile mercury is driven off, leaving pure sesquioxide of chromium, which is weighed and the percentags calculated. Sometimes the solution from the crucible is precipitated by acetate of lead, and the oxide of chromium calculated from the weight of the chromate of lead. It will be necessary in that case to nearly neutralize the solution with acetic acid before adding the acetate of lead. The calculation is made as follows: Suppose one gram of the ore was used in making the assay, and the sesquioxide of chromium obtained by the first method was 0.436. This multiplied by 100 would give the percentage = 43.6. In the latter case it would be as follows, using the same figures: One part of neutral chromate of lead contains .3096 parts of chromic acid, and 43.6 of chromate of lead obtained would equal $43.6 \times .3096 = 13.498$, the percentags of chromic acid in the ore. To obtain the sesquioxide equivalent calculate as follows: One part of chromic acid contains .5200 of chromium, and one part of the sesquioxide .6842 parts of chromium, $.6842 \cdot 5200 = 1.315+$. Then one part of chromium, obtained by the above calculation, would be equivalent to 1.3154 parts of the sesquioxide.

To simply test for the presence of chromium in a mineral, the following will afford quick and reliable results: The ore is finely powdered in an agate mortar. A bead of borax is then formed in a loop, on the end of a platinum wire, by heating the loop by means of a blowpipe flame. While still red-hot, the end of the wire is touched to some powdered horax and again heated. This is repeated until a transparent bead of borax glass incases the loop. When cold, the bead should be colorless, if the wire was clean and the borax pure. The bead is then to be slightly wetted and touched to the powdered ore. Only a small portion should be allowed to attach itself to the head. The blowpips flame is again applied until the substance is perfectly fused with the borax. While hot, the bead will generally be of a faint yellowish color, but when cold, if chromium is present, it will become emerald green. If the bead is touched while hot with a piece of tin-foil, the reaction will be intensified. It sometimes happens that too much of the powder attaches itself to the bead and an opaque glass results. In this case the bead may be broken by a blow from a small hammer, and the powder placed on a piece of white paper, when the characteristic green color will be seen. This color must not be confounded with the 'bottle green, which results from iron treated in the same manner.

To make this assay still more certain, the California State Mineralogist, Mr. Hanks, recommends proceeding as follows: Saturate the horax bead as directed, using more of the mineral without regard to the color—dip the bead into pulverized nitrate of potash, and heat again strongly in the blowpipe flame. The bead will now be yellow and opaque. Repeat the operation as long as the flux can be made to remain on the platinum loop. Let it cool and detach by a blow from a small hammer. Grind the powder in an agate mortar with water until a solution is formed. Add a drop or two of acetate of lead, using a glass rod for this purpose. A yellow opaque precipitate will appear. Now transfer the liquid and precipitate to a small white paper filter, and dry. It will be easy now to recognize, under a microscope, chrome yellow on the paper. This is a very conclusive test, and can easily be made in twenty minutes.

CONSIDERABLE excitement prevails among the people of Cherokee and vicinity, so we are informed, in relation to the location of quartz mines and wood ranches. A number of what are supposed to be rich quartz lodes have been located between Cherokee and Columbia Hill, on the east side of Shady creek. Good prospects have been obtained from some of the locations, and the locators are jubilant.—*Nevada Transcript.*

TENTS and small buildings will be probibited on the beach at Santa Cruz this summer.

Recording Mining Claims.

The following is the new Nevada law to pro de for the better preservation nf the mining cords of the State:

Sec. 1. It shall be the duty of each and ery mining recorder nf the several mining stricts of the State to require all persons lo ting and recording a mining claim to make a uplicate copy of each and every mining notice, hich copy the said mining recorder shall eare lly compare with the original and mark "Du icate" on its face or margin, and he shall im ediately deposit with nr transmit the same to e County Recnrders nf the respective counties which said mining district may be located.

Sec. 2. The said district mining recorders, the time of comparing said duplicate notices ith the original, shall collect from the loca rs of said mining claims the sum of one dollar r each and every notice compared, which sum shall transmit, together with the duplicate tices, to the County Recorders of the respec ve counties in which said mining claims shall located.

Sec. 3. Whenever, owing to the distance of the mining district from the county seat, it comes inconvenient for the district mining re order to personally deposit the duplicate copy ith the County Recorder, then in that case he ay forward the same by mail or express, or ch other manner as will insure safe transit d delivery to the County Recorder.

Sec. 4. The County Recorders of the several unties shall receive for their services for re rding each of said duplicate notices, the said m of one dollar, mentioned in section two of is Act.

Sec. 5. The county record of the duplicate pies in the office of the County Recorder, as erein provided, shall be received in evidence, d have the same force and effect in all courts the State as the original mining district cords.

Sec. 6. Any person neglecting or refusing to mply with the provision of the Act, shall be eemed guilty of a misdemeanor, and, upon nviction, thereof, shall he punished by a fine ot exceeding five hundred dollars, or by im risonment in the county jail not exceeding six onths, or by such fine and imprisonment.

Sec. 7. All acts and parts of Acts in con ict with this Act, are hereby repealed.

San Jacinto Tin Mine.

In the United States Circuit Court, Judge awyer has rendered a decision in the case of is United States vs. The San Jacinto Tin Com any. The ownership of a tin mine in San eruardino county was the occasion of this case nd of other litigation, the beginning of which ates back 32 years. The name of the United tates was used by Col. S. H. Baker, he being he plaintiff. The suit was to set aside the pat nt under which the tin mine is held by the San acinto Tin Company. Judge Sawyer dismissed he hill, leaving the victory with the tin com any. Mr. Hilborn intimated that an appeal ould be taken. Both parties at interest an ounced an intention to confer with the new nited States Attorney-General.

Judge Sawyer's decision was very long, and ver an hour was consumed in the reading. Al eged fraud on the part of officials con ected many years ago with the Land Office, he aid, was the basis of the suit. It has been de ided that the Act by which the Mexican grant as fixed was final and conclusive unless there as fraud. Messrs. Edward Conway, George . Thompson, T. C. Whiting and Joseph S. Wilson were alleged to have held an interest in he San Jacinto ranch at the time the location as made, and it was alleged that all bad fraudu ently conspired to locate the land to get posses ion of a valuable tin mine. If the charges were ot proven the case must fail. The character f the officials against whom the charges were ade was well known, and they denied di ectly that such charges were true. Conway urchased the grant, and that is on record. The testimony fails to show any act of fraud on he part of the persons named. Fraud not be ng established, every equitable ground upon hich the suit rests fails. The Court cannot eview any errors of location. It would be in quitable at this late day to vacate the patent. The present owners ought not to he disturbed, except upon the most cogent reasons. There hould he some time in a generation when Mexican land titles should be settled. It is ime that acrimonious legislation of this peculiar kind should cease. He hoped that in the future he name of the United States, for the purpose f private litigation, in such cases, would be sparingly used. The bill was dismissed.

THE NEWFOUNDLAND DISTRICT.—William Ames has returned from the Newfoundland district, bringing with him numerous samples of ore found in the new district. Some of the specimens assay 43 ounces silver, with a good percentage of lead. Another lot went $40 in copper and $39 in silver to the ton, with a streak of gold. Messrs. Browne and Brooks, of this city, who are heavily interested in some property there, propose to erect a mill and fur nace this year for the profitable handling of ores. The Newfoundland district is an island in the desert, the island being 25 miles long and about five wide. A boom is imminent for the district. Terrace, on the Central Pacific is the nearest railroad station, 20 miles away.—*Salt Lake Tribune.*

Useful Information.

SILVER SURFACED IRON.—A successful meth nd nf giving a silver surface to iron has for some time been employed by a Vienna manufacturer. The plan is to first cover the iron with mercury, and then silver by the galvanic process. By heating to 300° C., the mercury evaporates and the silver layer is fixed. Iron ware is first heated with diluted hydrochloric acid, and then dipped in a solution of nitrats of mercury, being at the same time in communication with the zinc pole of an electric battery—a piece of gas carbon or platinum being used as an anode for the other pole. The metal is soon covered with a layer of quicksilver, and is then taken out and well washed and silvered in a silver solution. To save silver, the ware can be first covered with a layer of tin, ono part of cream of tartar is dissolved in eight parts of boiling water, and one or more tin anodes are joined with the carbon pole nf a Bunsen element. The zinc pole communicates with a well-cleaned piece of copper, and the battery is made to act till enough tin has been deposited on the copper, this being then taken out and the iron ware put in its place. The ware thus covered with tin chemically pure, and silvered, is said to bo much less costly than any other silvered metals.

MANUFACTURE OF LIQUID GUNPOWDER.—One of the greatest difficultics encountered in the manufacture of gunpowder is the intimate admixture of the constituent parts, the combustion of which produces the explosion. Mr. Nordenfeldt has advanced a very ingenious and rather novel idea, for which he has applied for letters patent. He proposes, instead of grinding together the primary substances—sulphur, charcoal and saltpeter—in their solid state, to employ the following process instead: Sulphur in the desired ratio is put in solution as sulphato of carbon; this is mixed with carbonaceous matter, which in this case is not charcoal, but cotton, or cellulose fiber, ground to an impalpable powder. Finally, a saturated solution of saltpeter is added to this mixture in the required proportion. There remains now nothing to be done except to evaporate under disturbed crystallization—or *in vacuo*—to obtain a powder the elements of which, according to the inventor, are thoroughly mixed and therefore in condition to furnish the maximum useful effect. This is almost strictly a liquid powder which is thus obtained.

UNBURNT BRICK.—Much as many dispute the fact, it is nevertheless true that unburnt brick forms a much drier wall than ordinary burnt brick, inasmuch as they are not so absorbent of wet or damp. To make these, any ordinary clay will answer. If dry when obtained, it must first be moistened and thoroughly worked by the feet of cattle or pounded by the hand. Cut some straw into pieces about six inches in length. After being duly mixed with the straw, the clay is ready to be made into bricks. A mould of any size may be made. This mold should have a bottom, but not air tight, in order to prevent the brick from stickieg in the mud. The clay is put into this mold, and the brick formed much in the same way as ordinary brick. Should the clay be very tenacious, a little sand sprinkled in the mold will enable the brick to leave it freely. The bricks are placed on level ground to dry, turnieg them on their edges on the second day; thereafter left in piles, protected from the rain for ten or twelve days.

WHY CHINA IS SO NAMED.—Upwards of 1100 years before Christ, the Chinese were a people ruled by a dynasty of kings, of whom, like the Pharaohs of old, there is no clear history and not until the "Chow" dynasty, B. C., 1125, is there any history of the main Chinese State. The Chinese take their history back to the time of Noah. This very ancient empire has borne in its time many names, for it was the custom when a new dynasty ascended the throne to give another name to the empire, as Hai-que, Chum que, Han-que, etc., according to the name of the ruling monarch. The true name is said to be Chumque, "the center kingdom of the world." This term was by usage corrupted to Chin que, and from this word the Portuguese gave it the name of China. China proper consists of eighteen provinces, containing 250,000,000 people.

A NEW PAINT.—A new paint, consisting of a mixture of zinc white with zinc chloride, has been for some time in successful use at Brest for painting wood and metals; it becomes very hard, and can he washed or brushed without injury. It should not be applied, however, in rainy or frosty weather, as it then becomes mealy, and scales off easily. Chloride of zinc is not the only salt which possesses the power of forming a mastic by its mixture with zinc white, for Sorel long ago showed that the proto chlorides of iron, manganese, nickel and cohalt were good bases for mastic. The dockyard authorities at Brest have extended their experiments, and have shown that the sulphate and nitrate of zinc, the nitrate and chloride of iron, and the sulphate and nitrate of manganese, all form good mastics with zinc white.

BONES AND HORNS FOR ENGLAND.—The United States furnishes Great Britain with about 109,000 dollars worth of bones, horns and hoofs every year, a portion of which is returned in scales for the American cutlers, and the remainder from the finished cutlery from Sheffield. The shank bones of oxen are almost exclusively used for this purpose, 2,000,000 being required annually by the cutlery trade, and the best of these form a fair imitation of ivory.

SOAPSTONE FINISH FOR WALLS.—The latest invention for covering walls and ceilings is called "Soapstone Finish," and is mainly composed of pulverized steatite. It takes a high polish, it is pearl-gray in tint, presents the best possible surface for painting, either in oil nr water-color, and it will neither crack nor chip. It is claimed to he a non-conductor and non-absorbent, and can be washed without injury. Nails can be driven into it without damage. When subject to heat, moisture and chemical fumes, it is said to give no smell; it also does not turn yellow with age. It is recommended for hospitals, factories, cellars, markets, closets, pantries and kitchens, and is pleasanter to the eye than ordinary whitewash or cheap paper.

A SOAP BUBBLE RECIPE.—Dissolve one part, by weight, of borax soap, cut into thin slices, in forty parts of water (distilled water is to be preferred) and filter. 2d. Mix two parts, by measure, of pure glycerine with one part of the filtered solution, at the temperature of 66° F., and, after shaking them together violently, leave them to rest for several days. A clear liquid will settle, with a turbid one above. The former is to be drawn from beneath the latter with a siphon, taking the utmost care not to mix the two. A bubble blown with this liquid will last several hours in the open air. Instead of draining off the clear liquid with the siphon, the mixed liquid, after standing 24 hours, may he filtered and used for the bubble.

THE LIQUID HAND GRENADES for extinguishing fires consists of sodium chloride, ammonia chloride and hydrochloric acid dissolved in water, with the addition of potassium carbonate and subsequently sodium bicarbonate, and last of all a little free crystallized tartaric acid is added. The object of such a mixture is the generation of carbonic acid at the time of the fire, so that if it can be arranged to have a solution of some carbonates, sodium or potassium, so placed that in the event of fire a free acid of some character can be brought into contact with the liquid, thereby generating the carbonic acid gas, the purpose will be accomplished.

A NEW MACHINE IN TANNING.—An apparatus for tanning hides has been patented by Mr. Emile de Solminihac, of Lorient, France. A skeleton drum or cylinder is provided, upon the circumference of which the hides or skins are held or stretched, secured by clips, centrifugal action being utilized for causing the penetration of the tanning material through the pores of the hide or skin.

Good Health.

Good Common Sense.

EDITORS PRESS:—Our attention has been called to an article in your issue of the 21st, by Carrie S. Walters, entitled, "Good Common Sense." We agree with much the writer has said, and seeing so plainly that she unfortunately does not understand the character or scope of the life work we have before us, we not only send her sample copies of *Joyful News*, published to represent our cause of purity, but would, with your consent, occupy a little space to correct the misunderstanding that may be in the mind of other of your readers. Extremes, when they react, are apt to go nearly as far the other way; such seems to be the case with "C. S. W." after her unfortunate experience with vegetarianism. We gave the ultra-vegetarianism as thorough a trial as she, and are with her in voting it a failure; but we doubt if she has come so near to first principles as we have. Wish she had given particulars as to her present condition. We would like to compare notes. She says "eat whatever hest] nourishes and agrees with one, guarding jealously every means by which digestion and assimilation may be best promoted." This is splendid until, like we, you become so strong in those powers that nothing fails to digest, and you cease to know you have internal organs. We also became enfeebled living on bread and fruit until in the condition she describes; but the Edenic life has made a new man worth at 51, two such men as we ever was before. Whilst she "can even now digest very little fruit," we can eat and digest at one meal ½ lb grania, ½ lb walnuts and 2 lbs fruit. How much more we cannot say; but we tried the above as an experiment and the digestion was complete, whilst three years ago a half dozen walnuts would report trouble inside. Who would not try the Edenic. Any patent medicine giving such results would make the owner a millionaire. But a life of christian purity is too cheap and free to be accepted. We do not believe in "C. S. W.'s" idea of a return to state of nature. We believe in science, and if better results can he had by grafting pear on quince we have no more use for the pear roots. "Get the very best kind of food and eat it under the best conditions" is so good we repeat it. But my dear friend are you doing that. If you have anything that will do more for humanity as proved by such evidence as we have to offer, will you not come forward and help stay the tide of corruption and bring people to a life of purity and love. We are ready to be learners. Specimen copies of *Joyful News* sent to all who apply, whilst we have them to spare. Yours truly for truth,

ISAAC B. RUMFORD.

San Francisco, 1209½, Bush Street.

A Dietetic Investigating Society.

EDITORS PRESS:—One thing very much needed in this age of the world is a Dietetic investigating society, composed of scientific minds, to make a study of the influence of different methods nf living, and also the effect of the continued use of different articles of food in both the cooked and uncooked state. Said society should have committees appointed to take up different branches of the subject, gather in evidence pro and con and report to the society. Members and others should be induced to experiment, and note carefully the results. Judging from my own experience, since being connected with this subject, and from evidence received every day there is a broad field here open, worthy the best effort of careful thinkers. We have many minds devoted to curing people; we should have some who would make a scientific effort to find out how to keep well. If any persons wish help to form such a society, and will call upon or send their address to me, I will arrange a place and notify them, so we can all get together and consider the subject. Yours truly,

ISAAC B. RUMFORD.

San Francisco, 1209½ Bush St.

HEALING PROPERTIES OF WATER.—There is no remedy of such general application and none so easily attainable as water, and yet nine persons in ten will pass it by in an emergency to seek for something of less efficacy. There are but few cases of illness where water should not occupy the highest place as a remedial agent. A strip of flannel or a napkin folded lengthwise and wrung out of hot water and applied around the neck of a child that has the croup will usually bring relief in ten minutes. A towel folded several times and quickly wrung out of hot water and applied over the seat of the pain in toothache or neuralgia will generally afford prompt relief. This treatment in colic works like magic. We have known cases that have resisted other treatment for hours yield to this in ten minutes. There is nothing that will so promptly cut short a congestion of the lungs, sore throat, or rheumatism, as hot water when applied promptly and thoroughly. Pieces of cotton batting dipped in hot water, and kept applied to all sores and new cuts, bruises and sprains, is the treatment now generally adopted in hospitals. Sprained ankle has been cured in an hour by showering it with hot water, poured from a hight of ten feet. Tepid water acts promptly as an emetic, and hot water taken freely half an hour before bedtime is the best of cathartics in the case of constipation, while it has a most soothing effect on the stomach and howels. This treatment continued for a few months, with proper attention to diet, will alleviate any case of dyspepsia.

PREHISTORIC DENTISTRY.—The *Independent Practitioner* for January contains an article by Dr. J. G. Van Marter of Rome, upon evidences of prehistoric dentistry in Italy. In the museum of Corneto-Tarquinius, a city on the Mediterranean coast, the author found two specimens of ancient dentistry, which the mayor of that city certifies were found upon the first opening of the buried Etruscan tombs. Professor Helbig further assures him that these were virgin tombs, which date back four or five hundred years before the Christian era. In one of the specimens the two superior central incisors are bound by a hand of very soft gold to the teeth on either side. The artificial teeth are well carved, evidently from the tooth of some large animal. One other artificial tooth was held by the same band, but it is lost. Dr. Van Marter has in his own possession a skull in which the disposed of during the year 1,789,021,939 feet first upper molar on the right side is missing, and which shows plain marks of an alveolar abscess, proving conclusively the existence of toothache among the early Etruscans. As the tombs have been only slightly explored, and as only the noted men of Etruria were embalmed, the rest being cremated, it is not strange that these evidences of dentistry have been so long undiscovered.

INOCULATION OF TUBERCLES.—A healthy girl, a cook, broke a glass and ran a splinter into her middle finger. The glass was one used by her employer, who at the time was dying of consumption, in which to expectorate. A nodule of granular matter formed and was removed, and eventually it was found necessary to amputate the finger and remove the swollen glands of the elbow and the arm-pit. All the parts removed showed tubercular degeneration, and contained bacilli. Thus, whether the bacillus is cause, effect, or neither, it is evident that tubercular poison is communicable.

NUMBER OF DENTISTS.—In the United States there are 17,000 dentists, who use a ton of gold and five tons of other metals, and make 4,000,000 artificial teeth annually. Only one American in eighty is found to have perfect teeth, and one-third of the population make more or less use of the artificial product.

YELLOW FEVER VACCINATION.—Emperor Dom Pedro of Brazil has sanctioned a method of vaccination against yellow fever, and 500 persons have been vacciated at the Rio de Janeiro by Dr. Dominges Freire, to whose investigations the idea is due.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

AMONG THE CLAIMS.—Amador *Sentinel*, March 25: The Acme shaft in the Fort Ann district, is being retimbered. The McKinney & Craniss mine, at Middle Bar, is now being worked with favorable indications. Dan McKay has laid down a string of boxes on his claim for the purpose of sluicing off a portion of the ground. Work has been re-commenced on the Marlette and Sargent mine, at Middle Bar. The last working of this mine showed some excellent rock. Morgan & Shugert are now preparing the foundation for their new mill. They have brought a hydraulic into requisition to sluice off the ground. Hadley & Vair have purchased the Golden Gate hoisting machinery and will set it up upon their mine in Fort Ann district. Their shaft is now down 140 feet, with good indications. They are intending soon to erect a ten-stamp mill. The Petty Brothers' mine in Fort Ann district is looking favorable. They are running a tunnel 100 feet for the purpose of draining the surface water. The last run in an arastra paid $22.50 per ton. The ledge, near the surface, is from 10 to 15 inches in width, and at a depth of 25 feet it widens out to two and a half feet.

Del Norte.

FREE GOLD.—Del Norte *Record*, March 27: The board of directors of the Bald Hills quartz mine during the last week paid a visit to their mine and brought home with them about 30 pounds of rich ore from their dump. Most of the ore brought in shows free gold. The owners of the above mine are about to let a contract for sinking about 100 feet in their shaft. From what we can learn this mine is as rich as any in Northern California.

El Dorado.

THE TEXAS HILL MINE.—*Mountain Democrat*, H. S. Morey of the Placerville Foundry, has just turned out a self feeding and dumping water car for the Texas Hill mine, which carries 320 gallons. This mine is again being operated, and a full force of men kept at work.

BOULDER MINE.—Under the superintendence of of Delmont Blair, this property, situated in Coloma township is paying well. The mill has been kept running day and night ever since it was started up, about the first of February.

OLD HICKORY.—Last week we stated that A. E. Ball, of Oakland, was here looking after his mining interests. Since that time he has let a contract to Owen Roberts, Alfred Ball, Thos. Moyle and John Pascoe, to sink 150 ft deeper on the Old Hickery mine, just this side of Kelsey. So far as this mine has been worked, it has prospected well, and the owners have full confidence that when the present contract is completed they will have a good paying property.

Mariposa.

EUREKA.—Mariposa *Gazette*, March 28: The developments now being made at the Eureka mine, at Quartz mountain, Hornitos, is exceeding the most sanguine hopes of the proprietors. The level now being run into the mountain has uncovered a ledge of large dimensions, which can be milled at small expense. The rock is inexhaustible and will go $15 to the ton. This is something of a bonanza, when it is known that four-dollar rock will pay handsomely. The controlling interest in this property is owned by parties in Providence, R. I., they having purchased the same from S. C. Bates of Merced, and Mose Rogers of Hornitos, last fall. The two latter still own several shares in the mine. Mose Rogers is superintendent of the mine.

Nevada.

A NEW MILL.—Nevada *Transcript*, March 28: J. E. Owen, the millwright, leaves to-day for Washington township where he will erect a mill on the Waters mine. The timbers and machinery are all on the ground, and the work will be put through quickly.

MOORE'S FLAT.—The Metropolitan quartz claim is situated near Moore's Flat, between that place and Orleans Flat. It embraces 3,000 ft along the ledge, and is owned by L. F. K. Buck. Two tunnels have been run, one 500 ft in length and the other 326 ft. They show a fine body of pay ore from 3 to 6 ft thick, and 700 ft long. Wherever the ore has been prospected it pays largely in free gold and sulphurets. Two ditches run along about the claim giving all the water and pressure necessary for power. Since the discovery by Mr. Buck, seven other parties have found good claims in the same vicinity, while many others are at work sinking shafts and tunnels. There will be much activity in quartz mining thereabout from this time forth. The principal want at that section just at present, so far as this industry is concerned, is a mill for custom crushing. The prospectors have to bring their sampling lots to this city to be tested, an operation, that is expensive and consumes a good deal of time that could be otherwise employed. If the developments continue to be as favorable as they have been recently, it is quite likely that a mill will be erected there before many months elapse.

QUARTZ MILL WATER WORKS.—*Foothill Tidings*, March 24: Johnston & Body are at work on Wolf creek, just below the bridge on Auburn street, preparing to put in pipe for conveying water to Rogers' quartz mill in Boston Ravine. The pipe will be laid along the bed of the creek and will be about 2,000 ft in length, giving a fall of 4 ft at the mill, which is amply sufficient to run an over-shot wheel. A water tank will be built in the creek below the bridge, with dimensions of about 20 ft long, 4 ft wide and 5 ft deep, which will do for all the water necessary for running the mill. The pipe will be laid as soon as possible.

RECENT QUARTZ DISCOVERY.—Nevada *Transcript*, March 26: Very encouraging reports of a general character come to us regarding valuable discoveries of auriferous quartz recently made in the vicinity of Columbia Hill, this county. We wish some friend living there, and who has the facilities for thoroughly posting himself on the subject, would take the trouble to send the *Transcript* a communication giving the details of the developments that are being made. Such an article would be an encouragement to the prospectors and of material benefit to that part of the county in other ways. It would also be of deep interest to the public generally.

THE CALEDONIA MINE.—The Caledonia is the name of the quartz mine on the Coe Ranch, Little Deer creek, being opened by Messrs. Sutton, Battey & Co. They have cleaned out the old shaft and sunk about 4 ft below the former workings which gives them a total depth of 60 ft with an 18 inch ledge of good looking ore in the bottom. The drain tunnel is within 10 ft of the ledge, but owing to the wetness and softness of the ground the running of it has been temporarily stopped. As soon as the water in there has flowed off the tunnel will be pushed ahead again.

Placer.

SALE OF A GRAVEL MINE.—Auburn *Republican*, March 26: The Succor Flat drift mine, near Iowa Hill, Placer county, was sold a few days since for $100,000 to Adolph Weske, who immediately transferred it to a French Company for $200,000. The mine has been worked a great many years, and at present has the appearance of being far from exhausted. In 1882 there had been taken out of it $262,000. Since that time it has been paying very richly. Those who are conversant with mining matters say that prospects in the vicinity of the Succor Flat, and also about Forest Hill and Damascus have seldom been brighter than at the present time.

THE CHICAGO MINE.—Placer *Argus*, March 26: About three-quarters of a mile from Penryn is situated the Chicago mine which has lately changed hands. The present owners are, we believe, a Chicago company. J. A. Hall, a practical and experienced miner, is in charge. He is now putting in new machinery. The prospects are very encouraging.

Plumas.

GREEN MOUNTAIN.—Greenville *Bulletin*, March 25: This property is in a better condition than it ever was. It is equipped with a fine 60-stamp mill and all the necessary adjuncts to facilitate the working of the mine. Mr. Rodgers, the vigilant Supt., has things so planned that work proceeds with great regularity and economy of time. Work in the face of No. 6 tunnel was resumed a week ago last Monday. On that day a fair prospect was struck in the tunnel, and the ore continues good with advancement. The tunnel now being run is of double width, and the entire thickness of the vein of ore is being extracted for milling purposes. Although the hanging wall is bad, rendering progress slow, the face of the tunnel has been pushed ahead 30 feet since worked was resumed on it. The new stopes, 125 feet back on the face, are looking well. About 85 tons of ore is crushed daily and good returns are obtained. The experience in the Green Mountain mine is a forcible argument in favor of deeper mining in Plumas. It has been clearly demonstrated, both in this mine and in the Plumas Eureka, that the quality of the ore improves in depth. Such would, no doubt, prove to be the case with the Crescent and the Indian valley mines, as well as with many others, which are awaiting an application of capital by men of practical experience and intelligence.

Shasta.

PLACER AND QUARTZ.—Shasta county *Democrat*, March 28: Lowrey & Brincard are finding most encouraging prospects on the Silver Queen. They have a shaft down about 15 ft. Dale & Fife of the Silver King last week commenced hauling ore to the depot and the first carload will be shipped this week. Pay ore was struck in the Pioncer mine last week, and consequently the boys owning interests hold their stock pretty high. Fred Grotefend and his partners are showing considerable high grade silver and gold ore in their claim on Shearer's ground on Salt creek. Vet Hull has put men to work sinking on his claim, the first extension south of the Silver King. We hear that he has struck good ore also. Sanders & Whitlow of the Delta mine on Dog creek are putting in a concentrator to save their rich sulphurets which assay from $1,000 to $2,500 per ton. The new shaft of the McDonald Bros.' mine at Deadwood is now down 34 ft and sinking is progressing rapidly. The hoisting works are in place and are running smoothly. The new 10-stamp mill of the Niagara mine will start up next Monday. Everything is now in readiness with the exception of the concentrators which are now being put in position. Mr. Meyers of the Meyers mine at French Gulch is now getting out the timbers for a 5-stamp steam mill. His mine looks well at all points and it is undoubtedly one of the bonanzas of the district. Pehrson has opened out a body of ore on the Monarch, a cross-vein running through the Silver King belt. The shaft is down about 20 ft and Mr. Pebrson is more than pleased with his prospects. Thursday last Keifer & Tucker struck fair ore on the Monitor at a depth of 18 ft. The vein opened out 2 ft wide at this depth, pitching east. This vein is parallel with the Silver King. They put in pumping machinery and are now running 8-hour shifts. Mr. George Klein of Trinity county was in town Sunday on his way home from a three weeks' visit to San Francisco. While below he sold his mine in Deadwood district to a Mr. Sbattuck of Nevada county for $16,000. Mr. Klein was the first locator of a quartz mine in the Deadwood district. Jack Coonant was in town several days last week. We hear that he has a standing offer of $20,000 cash for his several gold mines on Squaw creek he discovered about two months ago, but refused that snug sum and will not sell for less than $45,000. John Q. Finch and Frank Thompson recently discovered a mineral-bearing vein between Welch's and Stump Ranch. Their discovery looked so encouraging that a few days ago they let a contract to run a 50 ft tunnel on the vein. They know the ore carries free gold, but they think it will develop into a good silver mine. Its course is nearly north and south.

Siskiyou.

PICK AND PAN.—Yreka *Union*, March 28: The Centennial mine, Klamath river, is in operation. A scarcity of water for mining purposes is reported at Oro Fino. This will be a very short season for most of the mines, but the yield of gold will exceed that of last season. Patrick Cronan has taken up 20 acres of mining ground on the north fork of Salmon. It will be known as the Cœsus claim. A Kanacka miner picked up a twelve-dollar nugget at the mouth of Spring gulch, a half mile above Yreka, one day last week. Mr. J. O. Welch, is working his hydraulic claim on French creek day and night. The Fort Jones Co., on the Klamath river, will soon commence operations with a large crew, starting in the rich channel which payed so well last year at the close of the season. Mr. J. F. Boyle, of San Francisco, has bonded the Schroder mine, on the divide between Humbug and Deadwood for $50,000. This is the mine from which $10,000 was panned from decomposed quartz during the winter months. The mine is bonded for 90 days. R. H. Campbell, with his large force of men, is piping away night and day in his claim in Quartz valley. Owing to the scarcity of water bis run will be shorter than that made last season, but the ground being richer it is expected that the yield will equal, if not exceed, the amount taken out last year. E. A. Deming by F. W. Gent has located the entire bed of Salmon river. Also the right of way through the ridge from Merrill's bar on Klamath river to Salmon river, 300 feet in width for tunneling and mining purposes. Mr. A. H. Denny is pumping out the Fortune drifting claim at Callahan, and mining will commence in a week or ten days. The Fortune is classed with the richest mines on the south fork of Scott river, and is equipped with the best hoisting and pumping machinery in the county. Mr. Denny is a man of means and well versed in mining matters. Mr. A. M. Johnson of Etna is erecting a boarding house at his quartz mine, near Oro Fino, to accomodate his employees. He says he has a better ledge than ever, and will work a full force of men during the entire season. Thousands of dollars have been taken from the mine, and it looks as though it never would run out. The army of ditch builders employed by Messrs. George Smith, R. H. Campbell and George C. Spooner in constructing the four mile ditch from Little North Fork of Salmon to their Summerville hydraulic mine, are making remarkably good headway. The completetion of this mammoth canal will insure long seasons for one of the best mines in the county. Mr. Henry Budelman of Etna has been appointed superintendent of the Black Bear mine, and is now in charge of the works. Lieutenant-Governor Daggett is expected to arrive every day, and work will be commenced as soon as he arrives. The resumption of work at the Black Bear will open another good market for Scott valley products, which in connection with the large shipments to New River will bring thousands of dollars which otherwise would never find its way to this county. The Hip Wah Hong Company numbering 18 Chinamen, have leased water from the Big Ditch Co., and commenced active mining operations on Yreka Flats, a short distance above town. The ground was worked in early days, but will pay to work again. Six years ago, when worked with giants the claim yielded from five to ten dollars to the man. The mine was only deserted when the new ditch was constructed on the east side of town and the old one abandoned. The Chinamen have great faith in the claim or they would never have refused wages to mine on the Klamath to work it. The Schroeder mine, on Deadwood, which was recently bonded by J. F. Boyle of San Francisco, furnished a ten pound nugget of nearly pure gold last week. When freed of quartz it netted $700.

Trinity.

DEADWOOD LETTER.—Trinity *Journal*, March 28: A long and interesting communication form our Deadwood corresponden', "Trinity," was not received until Thursday evening, and the little space remaining to be filled at that time compels us to condense as follows: Deadwood flourishes. Brown Bear is extracting good milling ore in large quantities. The mill is being repaired; will start up in a week. McDonald & Co. have their hoisting works in operation. Ramm & Kane are taking out splendid ore; Gibson & Blagrave, ditto. J. F. Dotiffe's find is immense. Gibson & Leavitt have a small, rich vein—a late discovery. On Shooter gulch (Eastman's) Hurlbut, Newman & Bearden are taking out rock held together with gold; Hamilton & Gifford have good prospects from a three-foot ledge; Hickey has from six to twelve inches of pay ore. Jas. Fisher & R. Killins are running the Blakemore arastras. "Curt." Blakemore has bought this property.

TRAVEL TO NEW RIVER.—The spring rush to the New River mines has commenced and will increase as the certainty of good weather becomes assured with the advance of spring. On our return trip last week we met 15 men on the road to the mines. All were afoot, some packing their blankets on their backs while others had pack animals. The night before our return four men arrived by saddletrain from North Fork in charge of Johnny Adams. In conversation with a number of gentlemen who reached the mines *via* Eureka, several assured us that they would have come by the Weaverville route had the through trail been completed this way. It is three days hard ride from Eureka to the mines, while from Weaverville they can be easily reached in a day and a half. Many who went there by Eureka simply to see the mines will return this way.

VERMONT MINE.—"A Subscriber" sends us the following from Deadwood: "I see mention in a late number of the *Journal* that the Davidson Cannonball mill was idle for lack of rock. That is a mistake. The mill has no way of saving the sulphurets, which is one reason why it is idle. Another is that the parties in charge of the mill cannot get the privilege of grinding custom rock. As for the Vermont mine, there is any quantity of good milling quartz in sight."

HUMBOLDT WAGON ROAD.—When in at the New River mines we had the pleasure of meeting Messrs. J. H. Crossman and N. Wescoatt, who are there for the purpose of surveying and reporting on its values to the proposed wagon road investors. A lithograph map of the district, will be publishcd, together with a full report of its present condition and future prospects. About three weeks more will be required to complete this work. The preliminary survey of the proposed wagon road will be followed on their return out to Eureka and the terminal line in Humboldt county determined. While the whole length of the road is unknown as yet, it is estimated by Mr. Crossman that there will be from 45 to 50 miles of its length in Trinity county.

RICH COPPER.—A vein of copper ore has been found by N. Lorenz and others on Trinity river just below the McGillivary ranch and near the schoolhouse. The deposit is loose and about six feet in width and it is thought will lead to a solid ledge. Several pounds brought to town by C. E. Goodyear are full of native copper covered with oxide of copper, and the lot is estimated as containing from 75 to 90 per cent of that metal. What its value may be, if anytbing, is not known here, as no attention has been paid to anything worth less than gold.

NEW RIVER MINES.—Trinity *Journal*, March 28: New River District is yet young and while from 150 to 200 locations have already been made and the number is being added to daily, there are comparatively few mines that have been developed to any extent, but each of these has proved valuable. The district is located on Slide Creek, a tributary of New River, and the locations extend over a section of five or more miles, including Battle and Eagle Creeks. The country is covered with float, much of which is very rich in free gold. As an instance of the latter, the Mountain Boomer location may be referred to. Although no permanent ledge has been found, something more than $9,000 has been realized in grinding float and detached quartz in an arastra. While at the Boomer we picked up several pieces of float in different places showing free gold, and a hand-full of earth which we "horned" yielded from 30 to 40 cents. When the ledge from which this came is found, it is expected to equal if not surpass the famed Standard of Bodie. The largest and longest continuous vein yet proved is that on which the Ridgeway, Hard-Tack, Head-Light and Claremont locations, covering 6,000 feet, have been made. Its general course is north-east and south-west. The Ridgeway, at the south-western end, has an incline down 200 feet, at an inclination of 22 degrees, with 100-foot drift at bottom. While the ledge on the surface was only 4 inches, it now shows a four-foot average between walls at the water-line, with from 12 to 30 inches of quartz—an average of about 20 inches—which goes $100 to the ton. Good work is being done on the Ridgeway under the efficient management of Geo. Dean, superintendent. In addition to work in the incline and drift, a tunnel is being run 200 feet which will strike the lode at a depth of 240 feet, giving drainage and ore delivery 140 feet below the surface. In the Hard-Tack, adjoining Ridgeway on the north-east, there is an incline of 140 feet, at the bottom of which the ledge shows from 16 to 24 inches between walls, mostly quartz. The incline is about the same as the Ridgeway and like it the ledge at the surface was only from 2 to 4 inches, gradually increasing as it goes down. This mine is the property of Ladd & Clements, the latter of whom informed us that all the ore crushed had averaged a little over $90 to the ton. The same gentleman is authority for the statement that from 1000 pounds of Hard-Tack rock he pounded out $287, and from specimens shown there can be no doubt of the accuracy of the statement. It is difficult to find a piece of rock in the lode which does not show gold. The Head-Light, belonging to Tom Baker & Co., and the Claremont, George Dean's, lying in the north-east of the Hard-Tack, have not been worked except to prove that the vein is in place and good. Adjoining the Ridgeway on the south-west is the North Star, one of some 20 locations belonging to the New River Development Company of Eureka. They are running a tunnel on this location with every prospect of striking the lode of which the four mines above mentioned are a part, and which when found will increase its known length to 7,500 feet. The lode is high on the hill above Slide Creek. The Tough-Nut, Thomas Baker & Co., nearer the creek and running parallel, has some splendid quartz and we learned that the vein is well-defined though small with every indication of widening as they sink on it. This company had just completed a splendid double arastra and started it up the day we left for home. The Uncle Sam has a steam-mill with five small stamps and are said to be doing good and satisfactory work. The Mary Blane also has a stamp-mill with steam-power and saw-mill attached, but work has not been resumed this spring on account of snow, it being located high above the other mines, on the Salmon divide, part of the location being in Siskiyou county. New discoveries are being made daily in that section, frequently several miles apart. The next evening after our arrival a prospector came in with a large crystallization literally covered with gold, and for which he was offered $10 by a gentleman who wanted it for a cabinet specimen. It was from a lode he had found that day at Rocky Point, on the north side of Potato Hill, about 5 miles distant from White Rock. It was also stated that several strikes had been made at Methodist Creek, on the Salmon side of the divide and that a new district was about to be formed there for the convenience of miners. The lodes were reported at 4 to 8 feet in width. Messrs. Fleming & Fitzgerald, old and responsible prospectors who represent Eureka capital, are investigating this new section which is 12 miles from White Rock. To sum up New River District, from our brief and by no means thorough investigation, it is a most promising quartz field, and gives every encouragement for the hope that it will prove rich and lasting. There are at present about 400 men in at the mines, engaged in prospecting, getting out timber, etc. There is no use in men going there in seach of work, for there are already as many or more there than can find employment in the present condition of affairs. Wages are $50 per month and board. There is an abundance of provision and pack-trains are running from Eureka, Scott Valley, and North Fork in that county. Mines are plenty, but capital for development is needed to crowd work and give to the section that activity and prosperity which its richness seems fully to warrant. It might be here stated that already the representatives of large mining capital are already there and preliminary steps have been taken for the purchase and operating of several of the best mines. New River is a splendid field for the intelligent prospector—a man who understands hunting for quartz and who has enough money to carry him through the summer. For such men the chances of striking it rich and making a fortune are more than good.

Tuolumne.

MILL RUNNING.—*Union Democrat*, March 28: The new mill of Lang & Shaw on the Kanaka mine, near Groveland, has been completed, and has been running nearly all the week. It does the best of work, and is complete in every respect. The only drawback at present is the lack of water which prevents the mill from being run on full time. The mine is looking very well, the vein is of good size and easily worked. The quartz contains a considerable percentage of sulphurets, which are saved by a Schofield concentrator.

SALE.—Tuolumne *Independent*: We hear that Dr. Drake has at last succeeded in selling the Hyde mine, to an Oakland party—Messrs. Isaac W. Knox, T. Alexander and M. P. Ross—but it is not altogether a cash transaction, being on the deferred

payment system. A payment of $500 has been made and a bond given for a deed to be executed on the 1st of July next, the parties having the privilege to work the mine in the meantime. It is more than probable that a 20-stamp mill will very shortly be set up, if everything proves satisfactory.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, March 28: Cross-cut No. 3, on the 2900 level, was in 40 feet last evening, 30 feet of which was in a vein of good milling ore, containing bunches and streaks of a rich black sulphuret and chloride character, and the face still continues in the same, with no indication of west wall as yet. Cross-cut No. 2, 50 feet south, showed eight feet of good ore, all of which indicates that the ore is widening as it goes toward the Savage ground, which is not far off—about 150 feet. All of which may be considered a favorable circumstance, so far as the Savage is concerned. On the 3000 level the north lateral drift is 180 feet in length, and a cross-cut west from it to toward the ore vein was commenced on Wednesday last, three cross-cuts being projected, of which this is the middle one, or No. 2. This being well started in, is temporarily discontinued, and yesterday cross-cut No. 3, at the north end of the level, was started. Cross-cut No. 1, at the south end, will be started shortly, it being the intention to run all three of these cross-cuts west simultaneously into the ore vein.

CON. CALIFORNIA AND VIRGINIA.—The 1750 level still continues to yield a considerable amount of paying ore, yet not sufficient to keep the Morgan mill running, consequently the mill is now waiting for an accumulation of ore. The 1550 level, being worked under the Jones lease, is turning out ore enough to keep the Eureka mill running steadily and remuneratively.

CROWN POINT.—The old upper workings above the 1700 level continue to send forth numerous tons of low-grade ore to the mills on the Carson river. Owing to the growing scarcity of water in the river, however, quite a number of men have had to be discharged recently, consequently the yield of ore is somewhat decreased.

SIERRA NEVADA.—The old surface machinery is being put in working order, and will be ready to start up on the first of next month, when the old upper levels will be reopened, and thorough prospecting at that point inaugurated.

ALTA.—Running the lateral drift north on the 950 level progresses, and cross-cut No. 2, west from this drift, is now in 18 feet. The water of the flooded lower levels has raised up to the 1250 level, and is still slowly rising.

KENTUCK.—The 1300 level continues to yield a good grade of gold-bearing ore, which is reduced at the Rock Point mill on Carson river. The old upper levels still continue to yield a goodly quantity of fair grade ore.

YELLOW JACKET.—More men are employed in this mine than any other on the Comstock, extracting low-grade ore from the old upper workings, which is milled on the Carson river.

OVERMAN.—Good work is being done in the old Lambert tunnel, which has been put in order, and is being driven forward into the low-grade ore of the upper workings.

BULLION.—A drift is being run into the croppings, from about the level of B street, to test the merits of the low-grade ore known to exist in the upper part of the mine.

CHOLLAR.—Cross cutting west on the 3000 level, near the south line of the Hale and Norcross, and getting into near proximity to where the ore vein is expected to be found.

WOODVILLE.—Some good pay ore is being extracted from this mine, on the 300 and 400 levels, by Charles Lyons, working on tribute, employing about 14 men.

BELCHER.—Considerable ore of a fair grade is being taken from the old upper workings, through the Crown Point.

Castle Dome District.

THE NEW MINES.—*Silver State*, March 28: Late reports from the new mines recently discovered near Buffalo Springs, on the Idaho road, confirm what has hitherto been said of their richness. W. A. Rodifer, who discovered the Bullion mine at Spring City, Lew. Morse and Pink Boyd have located a lead, some specimens from which assay as high as $13,000 per ton. Charles Kemler, who arrived yesterday from Paradise, says the new discoveries have created considerable excitement in that section. Half a dozen assays of as many specimens averaged over $7,000 per ton. The district in which these new mines are situated was organized some time ago by Paradise prospectors and named Castle Dome. It is in what is called the Mount Rose range, and is about 35 miles north from Winnemuca near the Idaho stage road.

Esmeralda District.

THE ANTELOPE MINE.—Walker Lake *Bulletin*: March 25: Seawell and Newton have completed the tunnel to the old workings in the Antelope mine, and have now 5,000 tons of good ore in sight. This ore will probably be reduced for a time at the mills already at Aurora, but if the tunnel is continued as now contemplated and the result is as predicted by those who knew the mine in early days, a new mill will have to be erected.

WORK RESUMED.—The Silver Hill mill at Aurora, begun to-day crushing ore from the New Esmeralda group of mines, on which a force of men has been engaged during the past winter running levels and preparing the workings for the extraction of ore at a rate which would keep the mill running steadily for the coming season.

ARIZONA.

MOHAVE.—*Miner*, March 29: The Mulligan Bros. have a foot of good ore in the Flagstaff mine at Corbat and will do well out of it. James Twiggs is working on the Standby mine between Stockton and Corbat, on a lease. John Hughes and Anson H. Smith are working on the Constellation; a valuable mining claim near Stockton. Messrs. Cole and Caffrey have a force of men at work on the Alpha mine, and are taking out the usual grade of ore. The Hackberry mine and mill have closed down under the present management for an indefinite period. At present writing there are five men chloriding in the mine. W. C. Parsons, the well-known Tombstone capitalist, has sent up a couple of men from Tombstone to work on the Floro mine.

TAILINGS.—Prescott *Courier*, March 30: The fine ten-stamp mill of the Peck company, at Alexandra, in this county, is being fixed up for a long run on Peck tailings. Mr. W. C. Dawes has a lease of the mill and the right to work the tailings. He has had them assayed and sampled, has engaged a good mill man and will, undoubtedly, make money out of them. These tailings have been exposed to the weather for years and may yield their treasure freely. The mill is located in a splendid mining region, convenient to a great many ledges which contain gold as well as silver, so that there is great hope of a lasting boom in that section. Meeting Mr. Craigue on the street, we questioned him concerning prospects at the Sterling. He assured us that the old mine is looking first rate. His men are now driving a winze. The vein is very large and the ore carries sufficient gold to pay for fooling with it. The company will, ere long, have a 15-stamp mill crushing the ore. The Sterling is about five miles south of Prescott, in the pine timber. Under-Sheriff M. L. Lawler is in receipt of a letter from his friend E. G. Wager, of Humbug district, in which the writer states that the Humbug mill is doing well on silver ore and will very soon be set to work crushing gold rock. No new strikes are reported, but old ledges are yielding considerable rich ore. Returns from placer mines now being worked are very cheering. Tracy's placer, Hassayampa creek, is yielding plenty of coarse gold, so are the Lynx creek hydraulic and sluice diggings and the diggings near Walnut Grove and Weaver. Riggs & Co. have made a good clean-up, on the lower Hassayampa. Black canyon claims are rewarding those who are working them. Messrs. Sam Bright and Geo. E. Berry find trouble in getting to the bed-rock in their claims on Groom creek, but prospects which they get out of loose gravel are very encouraging.

RUNNING.—*Silver Belt*, Mar. 27: The Miami is running this week on 11 tons of silver ore from the Cotton Tail and 23 tons of gold ore from the Golden Gate mine, belonging to S. Klein. The clean-up will be made to-day and it is expected that about $2,000 will be realized from both lots of ore. The Cotton Tail ore went 44 ounces, which is 14 ounces more than was expected, and the value of the Golden Gate ore also exceeded the expectations of the owner, 5 ounces, yielding 23 ounces per ton. Messrs. Tebbs, McCabe, Fredericks & Warnick have nine men employed taking out a ditch 600 yards long to their placer claim, situated in the gulch adjoining and to the north of Chaffin and Phillip's location. They will get their water from the gulch leading down from Bemen's saw-mill. They expect to have the ditch completed inside of ten days. Messrs. S. Klein & Co., have shipped three bars of silver to San Francisco last Saturday, the product of ore worked at the Miami mill, from W. V. Kingsbury's mine; the Peacock, owned by J. C. Coplin, and the Neilson, owned by Garlinghouse and Lynch. Total value of bullion $700. On Wednesday last Klein & Co. shipped another bar valued at $250. The owners of the Cotton Tail are so encouraged by the returns of the ore worked at the Miami mill that they will take out 100 tons from their mine. They have a large body of ore which will go 44 ounces and over in silver. Walter Fitzsimmons has taken out a quantity of silver ore from his mine near Dripping Springs, which he will bring to Globe to have worked at the Miami mill. The ore will go over $500 to the ton.

COLORADO.

ELK MOUNTAINS.—Elk Mountain *Pilot*, March 22: There is a rumor afloat that Moffat, the Gunnison smelter man, will remove his smelting plant from there on account of some local differences. Work on the Daisy lode was begun last Tuesday. It is the property of Alexander Gullet and Dr. R. C. Evans and is located in the head of Evans Basin, near Elk peak. There is about 70 feet of work done upon the claim and they will begin taking out ore at once, which will be shipped as soon as possible. They expect to do a large amount of development work this summer. Milt Dale went up to his claim (the Betsy) in Washington gulch, last Friday and brought down some ore for a test. He says they have about 18 inches of 50 ounce ore, and thinks he can make it pay well to work extensively.

CRYSTAL CITY.—James Sprague is sinking a shaft in the Milwaukee tunnel on some splendid, rich ore. The Detroit cross-cut is in 40 feet from the shaft and the vein is expected to be cut soon. The Belle of Titusville is in decomposed mineral and they are approaching another larger vein, which they expect will show up a big vein of mineral. Good reports come to us from the carbonate claims at Rock creek hot springs. Ed. Gift has four to five feet of lead and carbonate ore, and is a splendid looking property. They have one foot of solid lead and between three and four feet of carbonate ore. Andy Anderson has run 200 feet on his claim this winter, and he has some fine looking ore. Bob Corey has a good vein on White House mountain which is improving with depth. Snow on the south slope of Sheep mountain, and Mineral Point, is melting fast, and claims can be worked within ten days on the side hill. Frank Edgerton is troubled with bad air in the Lulu tunnel and can only work half time. We expect to see work start up soon on our smelter which will bring this camp to the front.

MONTANA.

LEXINGTON.—Butte *Inter-Mountain*, March 26: Operations in the Lexington are confined mainly to the extraction of ore from the 400 and 500-ft levels and to the extension of the drifts from the face of the 650-ft south crosscut. The character and amount of ore in the deepest workings is not known. It is ascertained, however, that the product is more refractory than usual, though that will not prevent Mr. Wartenweiler from working it to a high percentage. Sinking from the 650 to the 800 ft level will soon be resumed and for the active prosecution of the work an air compressor is now being erected and is expected to be in operation within two weeks. Diamond drills will be used, and the 800 ft station, will soon be reached.

ALICE.—Extensive preparations are apparent at the Alice for the active development of the company's mines. The Cornish pump, the largest and most perfect piece of machinery in the west, is running with remarkable smoothness and is fully able to meet all demands upon its capacity. There is therefore no further obstacle in the way of deeper exploration. A new hoist will also be put in by Frizer & Chalmers capable of sinking to a greatly increased depth.

MAGNA CHARTA.—The Magna Charta shaft, which for some distance is large enough for only two compartments, is now being increased in size so that it will contain three compartments. As soon as this has been accomplished a Cornish pump will be shipped up from Utah and started into operation. It is estimated that the new Alice pump saves the company between $50 and $60 per day in fuel alone.

MOUNTAIN VIEW.—This mine is a steady shipper of crude copper ore, of which it has more in sight perhaps than any other copper property in the district with the exception of the Anaconda. The north and south veins from the 400 to the 600 ft levels inclusive show vast reserves of ore, upon which a 100-ton smelter would scarcely make an impression in a year. A new strike was made a few days ago in the 600-ft west drift of the north vein where a solid body of copper glance 6 ft wide assaying 76 per cent was opened up. No better or more compact body of ore was ever found in this or any other district, and Mr. Larabie is making preparations for some heavy shipments of it.

NOTES.—The Clear Grit is making regular ore shipments of 25 tons daily to the Colorado smelter. The Stevens is shipping 20 tons of $40 ore daily. The Bluebird is said to show one of the longest continuous ore shoots in the district. The product is generally a carbonate containing some lead. The dump is assuming stalwart proportions. The Silver Safe and Rising Star are both being actively developed. The Rising Star people have already done 1500 ft of work; the Silver Safe shaft is making a bee line into the ground on good ore.

THE OUTLOOK.—The mills and smelter now in full blast on Butte ore are as follows: Alice, Moulton, Silver Bow, Lexington, Dexter and Old Lexington, and the Anaconda, Colorado, Bell, and Montana smelters. If necessary arrangements can be made, the Parrot will not much longer be idle. The silver interests of Butte never looked so well as they do today, and the present production of all kinds of ore was never before equalled.

ANOTHER RICH LODE.—Helena *Independent*, March 26: The Helena Lode the property of Raleigh & Clarke, S. T. Hauser and T. H. Kleinschmidt, situated about 4 miles west of Helena promises to be one of the best bonanzas in the country. A 75-ft shaft is now upon the lead, and 5 ft of good paying ore is shown. We were unable to learn the value of the ore, but received sufficient assurance from the fact that the company are constantly shipping ore to Wickes for the purpose of being worked that handsome dividends are declared. The most favorable thing in connection with the lode is that it is greatly composed of carbonates, a feature that adds considerable to its value, considering the fact that the great boom of Leadville was occasioned by the immense amount of the same class of ore found in that district which proved so rich. A large number of men under the management of George Cleveland are now busily engaged in developing the property, and that the mine will be one of the best in the Territory is considered beyond a doubt. There are a large number of new discoveries in the vicinity of the Helena lode which show strong indications of oxides of iron and carbonates.

NEW MEXICO.

MALONE.—Silver City *Enterprise:* More work has been done on the Young Man than upon any other property in the camp. It is owned by a California company, who have done considerable development work and have taken out a large amount of ore since they took charge of the property. The mine has been opened at some seven or eight places, and at every point shows good ore. It is said that the company will soon erect a mill, but of this we have no positive information, as the superintendent states that the company do not care to have their property mentioned in the papers. There are many other mines in the camp that show good ore besides the Young Man, but owing to the exceedingly bad weather we personally examined only a few, located on the dyke between the gulch and the Young Man. The Walapise is only a short distance from the gulch. The gangue is quartz and talc, carrying horn silver and sulphurets. A five-foot breast of ore has been uncovered, an average assay of which shows it to run over $100. No mill return has yet been had from this claim. Considerable work has been done on the Walapise, and from the showing made it is considered one of the best claims in the camp. The Last Location and Heraldston come next. In the first one the contact is about 40 ft wide, from almost any part of which an assay can be had. Very little work has been done on either of the claims, but the surface indications are certainly all that could be desired.

SILVER.—Silver City *Enterprise*, March 26: Nineteen silver bricks were shipped from the Mimbres Company's mill last week. About 25 men are engaged on assessment work and taking out ore in Hanover gulch. The ore of that camp is of a very desirable character for the smelter here. Jacob Long and Charley Cox have located a claim in Hanover gulch which they have called the Little Mamie, and have sunk a shaft 17 ft deep upon the ore vein which assays $30 in gold. The surface rock runs but $5 and at the present depth it will pay its owners well to work. The vein is 18 inches in width. John A. Miller has made arrangements to put up a 10-stamp mill upon the Peacock property, in the Mogollons, and it is likely the machinery will be here in a very short time, as we understand it is Mr. Miller's intention to ship it before he leaves San Francisco.

OREGON.

PLACERS.—Bedrock *Democrat*, March 23: Owners of placer mining properties throughout Baker county, are starting in this spring with renewed energy, and the output of the precious metal gives promise of large amounts. We are glad to know that at last men of enterprise are turning their attention to the gravel deposits of Burnt river. It has been supposed for many years that deep gravel beds that would pay for working existed on Burnt river, but prospectors have been loth to experiment, and only within the last few seasons, have these supposition come within verifications and now that a start has been made, we have no fear but that the great Burnt river country will do its share toward adding to the mineral wealth of Baker county. At Mormon Basin, Colt & Co, are making extensive preparations to put in a good season on their valuable ground. These diggings have been worked for many years, turning out thousands of dollars profits. They work their ground on the latest improved plan—with numerous "Little Giant" hydraulics, and it is a novel sight to witness the tearing down of large banks of gravel by this modern process. Blair & Glover, of the same camp, have several hundred acres of patented placer ground, and this season intend to work them on a scientific principle, and as the larger portion of the ground has been well prospected, they are confident of realizing large returns. They will employ a large number of workmen. At Clarksville, Wm. Neabuhr, will continue the working of the same placers that have been operated by him for many years, and out of which he has made an independent fortune. The claims still prospect well, and no doubt will come up to the standard of former seasons. The creek claims, recently purchased from J. W. Virtue by a large company of Chinamen, and containing several hundred acres of patented ground will be operated this season. Already the Celestials are setting their hydraulics, and making other needed preparations. At Malheur, Mr. James Lynn, will this season operate on some of the most valuable ground in the camp. About a dozen other sets of claims will be worked in this camp this season, and all promise good returns. Work will be commenced as soon as water is brought through the great El Dorado ditch, which will be in operation in a short time if good weather continues. The New England Mining Company John W. Drew, Supt., of Rye valley, will employ an enlarged force of workmen on their mining claims this season. This company is composed of New Hampshire capitalists, and we are informed they are thoroughly satisfied with their investment. Under the management of Mr. Drew, the output from these claims, will be larger than ever, and redound largely to the advertisement abroad of our vast mineral resources. Osborne & Co. have had a large force of workmen employed all winter putting in a ditch about 5 miles in length to cover a large belt of gravel claims situated on the banks of Snake river, below the mouth of Connor creek. The ditch is not yet completed but will be in a short time, when some very extensive mining may be looked for. Near & Sisley, of Connor creek, have already commenced operations, and have very flattering prospects. The mines of Salmon creek, situated 8 miles west of Baker City, are the most extensively worked placers in the county, the several owners of sets of claims being Nelson & Co., Carpenter & Jones, Wm. Daily, with about a dozen other miner companions. The Nelson claims will commence operations next Monday, and it is the intention of the owners to put on the largest force of workmen ever employed, besides more extensive improvements for the successful taking out of the precious metal. Indeed, the managers of these diggings are up to all the latest scientific principles of mining. At Fort Sumpter, as soon as Kimbol & Young succeed in getting the spring flow of water through their ditch, more than a dozen different placer claims will commence operations. Sumpter is one of the oldest camps in the county and its claims have been worked constantly for a quarter of a century, and yet hundreds of acres of rich gravel deposits await their working by the hardy miner. This camp has never failed in turning out its share of wealth every season, and now that every improved method for working is operated at the present day, this year promises even richer rewards than its predecessors. At Auburn, the Marysville Mining and Ditch Company, expect to get water through their immense canal about the first of the month, providing fine weather continues. This company besides operating large water supply, also employ a large force of workmen on several sets of placer claims and this year intend operating them on a more extensive scale than ever. The claims of Auburn have been constantly worked since their first discovery in 1862, and millions of dollars have been added to the wealth of the country. The placers still prospect well, and may continue to pour out their richness for years to come.

ANOTHER STRIKE.—Bedrock *Democrat:* Last winter, George Beber, an old California and Colorado prospector, struck a fine body of good prospecting gravel on a high bar in an old channel of Burnt River. The bar is over 1,000 ft in hight, facing the river, and runs back into the gravel hills sloping from the Myrick mine and Rye valley. It prospects from two to ten cents to the pan in seven feet of blue gravel. Eighty acres have been taken up by Beber, Cooper, Willard and Gray. Yesterday, C. M. Foster went out to survey the ditch to take on the water from Shirt Tail creek, when an extensive placer mine will be opened, which will in a measure, benefit Baker county. Since the above was written we understand that a Mr. Porter has purchased the land and ditch, the purchasing price being $1,000.

UTAH.

REVIEW.—Salt Lake *Tribune*, March 26: The week has been mild and pleasant, but the movement of the metals has been extremely light. The receipts of ore were light, both from Utah and Idaho, the hills in this Territory being too much snowed under to ship freely, and in Idaho the miners' strike practically stopping production for the time. The shipment of bullion and ore out from this city for the week ending Saturday, March 21st, inclusive, were—59 cars bullion, 1,328,400 pounds; 8 cars ore, 242,700 pounds; total, 67 cars, 1,571,100. The receipts of ore and bullion in this city for the week ending March 25th, inclusive, were—of bullion, $44,523.44; of ore, $5,275; total, $49,798.44. The week previous the receipts were $79,422.65 of bullion and $9,950 of ore. The Ontario produced during the week 49 cars of bullion, $38,558.14, bringing the total product of the year to date up to $398,955.52. The usual monthly dividend of 50 cents a share, being the 105th of that amount, has been declared, amounting to $75 000; total dividends this year, $225,000. Two bars of Christy silver were received during the week, valued at $3,115.30. The Stormont added one bar, $2,850, making a total for the Reef during the week of $5 965.30. Ore receipts were $2,600 from the Crescent, Utah, and $875 from the Minnie Moore, Idaho; also $1,800 Idaho ores.

THE CONSUMERS' COMPANY.

HERCULES SLAYING THE GIANT.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be cut connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

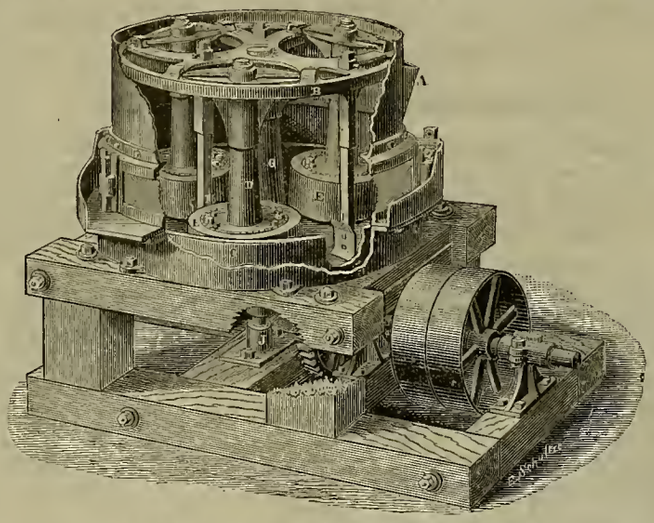
F. A. HUNTINGTON'S
CENTRIFUGAL ROLLER QUARTZ MILL.



Ecomony in Expense of Plant. Economy in Cost of Working. Economy in Saving Gold. Economy in Transportation of Machinery. Economy in Cost of Erection of Mill at Mine. Economy in Time Required to Establish Plant (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of continuous use at a number of mines in California has enabled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached THE ABSOLUTE in the construction of a perfect Quartz Mill.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING MARCH 24, 1885.

314,332.—WIRE FRUIT JAR FASTENING—W. F. Hannes, Oakland, Cal.

314,335.—BICYCLE—Thos. Johnston, S. F.

314,337.—ICE MACHINE—J. C. Kitton, S. F.

314,456.—ARMOR FOR VESSELS, ETC.—W. N. Le Page, S. F.

314,398.—MOLD FOR CONCRETE STRUCTURES—E. L. Ransome, Oakland, Cal.

314,300.—SACK HOLDER—J. W. Rush, Stockton, Cal.

314,496.—CAR COUPLING—A. W. Van Dorston, Salem, Or.

314,227.—GENERATING STEAM BY ELECTRICITY—Vaughn & Eldridge, Stockton, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BICYCLE.—Thomas Johnston, S. F. No. 314,335. Dated March 24, 1885. This improvement consists in a hand crank located above the head of the machine, and in a connection between the said crank and cranks on the axle of the front wheel, said connections having stirrups upon them for the receptiou of the feet, whereby through the joint action of hands and feet the bicycle is propelled.

ICE-MACHINE.—John C. Kittou, S. F., No. 314,337. Dated March 24, 1885. This invention relates to certain improvements on a former one patented by Mr. Kitton; and it consists mainly in a series of open-ended chambers supported with in a tank, so as to be surrounded by a freezing medium; packing plates by which the fresh water within the chambers is prevented from coming in contact with the freezing medium without, and a space or chamber surrounding and hclow the refrigerating chamher, and with which the ends of the freezing chambers communicate for the purpose of depositing the impurities of the water, so that they will not he contained in the ice after it is formed. The invention also consists in certain details of construction, and in a means of producing a circulation of water through the chambers while the freezing is going on.

GRAIN CLEANER.—Daniel Best. No. 313,911 Dated March 17, 1885. This invention relates to certain improvements in secondary grain cleaners, such as are usually employed in connection with thrashing machines and separators, for the purpose of completing the cleaning on a large scale, and in a siugle continuous operation, of grain which has already heen partially cleaned in the separator. It consists of an attachment to receive the grain which has heen blown or carried to a point near the discharge end of the riddles of the machine, and which, falliug through these riddles, is received in a transverse spout at the bottom. In this invention this spout discharges into a conveyor, hy which this lighter grain may be either discharged into the spout which hrings the grain from the separator or into the elevator which carries the grain upward and discharges it into the hopper at the top of the machine, or when seed-wheat is heing cleaned the discharge from the spout may he conveyed away into sacks, so as to be again returned to the apparatus.

ILLUMINATING BASEMENTS.—Peter H. Jackson, San Francisco. No. 314,026. Dated Mar. 17, 1885. The patent covers improvements in the illumination of hasements of buildings hy mcans of glazed tile. It consists of tile made in patterns of such a description that they can be kept in any quantity and in stock and ready for use upon any building without regard to the regularities of outline or regard to the contour of the building front; and in connection with these, of similar plates which may be either plain or glazed which will he fitted to the outline or contour of the building or where the tiles are to he used. Together with this Mr. Jackson employs certain means for supporting the different parts, joining them to each other, and forming joints between them which will not leak. It is usual where a new building is to he constructed, and illuminating tiles or iron work is to he fitted to the pavement or sidewalk in front of the building, to wait until the columns, sills and risers are placed in position before the tiles are constructed, in order to make good joints and a close fit between parts. This is uecessary because these parts of the iron work rarely come into the exact place which is designated by the drawings, owing to the slight change in form on casting the metal, or from other reasons. The tiles are then fitted to the irregularities of the contour of the front of the building, and are then glazed and placed in position. Mr. Jackson's invention contemplates the construction of tiles of certain length, made preferably of rectangular form, so that they can he laid in front of the huilding without regard to the contour, and with these, of supplemental irregular plates or tiles, one edge of which will be fitted against those already described, while the other may be fitted to the contour of the buildings.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Mining Share Market.

Hale and Norcross continues the central point of interest among stock dealers, most other stocks being neglected. The vein or body of ore developed on the 2900 level by cross-cut No. 3 shows fully 30 feet in width, and the face of the drift continues in it, with no west wall as yet, although it cannot be very far off. It is not all high-grade ore by any means, although containing frequent bunches and streaks of rich sulphuret ore assaying high up in the hundreds, but frequent tests have established the conclusion that the whole will average well under the stamps, as a milling proposition. The Virginia *Enterprise* says: The three cross-cuts west from the 3020 level lateral drift, which will be driven simultaneously into the vein, will be watched with intense interest, for upon these deep ore developments depends the future status and financial bottom, so to speak, of not only the Hale and Norcross, but of the deep workings of the whole Comstock. This Hale and Norcross development may be considered as a most excellent prospect, which bids fair to culminate in a rich bonanza. If it does, it will encourage the resumption of deep operations all along the lode where they have been abandoned, but if it proves to be a failure, good-bye to the levels below the Sutro tunnel. Throughout the whole extent of the good old lode the existence of almost inexhaustible amount of low-grade ore have been demonstrated, and the only problem is whether it can be made to pay for extraction. At some points it undoubtedly can, and how much of the whole can be worked at a profit above the cost of extraction and milling will depend entirely upon ruling circumstances. Unless Hale and Norcross now proves and demonstrates the contrary the future of the Comstock lies above the level of the Sutro tunnel. This is the whole story in a nutshell.

Market Reports.

Lumber at Wholesale.

There is a fair trade in lumber, but no special changes in price. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

We refer, by permission, to the editors, publishers and agents of this paper, who are authorized to contract for printing.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

Mining and Scientific Books.

PUBLISHED OR FOR SALE, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free.

Bobtail Car Conductors.

A Brooklyn judge has decided that bobtail cars in that city must be provided with conductors, in accordance with an ordinance of the city council. There are only a few short lines of bobtailers in Brooklyn, but in New York we have more than are agreeable to the citizens generally. Still it is doubtful if the companies can afford the expense of conductors.—*Railway World.*

THE deposits in the mineral regions near Ellensburg, Washington Territory, are attracting a wide interest, and many persons will go prospecting and visit the mines who have never been there before. People from Colorado, Montana and Nevada are among those curious to learn about the mines and mining in Kittitas county. A more thorough search for quartz will he made the coming summer than has ever been made before.

NOTICE

Is hereby given that a meeting of the stockholders of the Lord of Lorn Gold and Silver Mining Company (a corporation) will be held on the 11th day of May, A. D. 1885, at one o'clock P. M., at the office of said corporation, in room No. 6, in building No. 318 Pine street, in the City and County of San Francisco, California, for the purpose and with the object: First, of increasing the capital stock of said corporation, so that the whole amount or par value thereof shall be $10,800,000, divided into 108,000 shares of the par value of $100 each; and, Second, to repeal the by-laws of said corporation, or any part thereof, and to amend the by-laws, or to adopt new by-laws therefor, as said meeting may determine. By order of the Board of Directors and Trustees, and of the President. March 7, 1885. JAS. T. McDOUGALL, President.
R. N. VAN BRUNT, Secretary.

DIVIDEND NOTICE.

Plymouth Consolidated Gold Mining Co.—23 Nassau Street, New York, March 26, 1885.

DIVIDEND NO. 23.—The twenty-third consecutive monthly dividend of Fifty Thousand Dollars, being One per cent on the capital stock, or Fifty Cents per share, will be paid on the sixth day of April, at the Company's offices in New York and San Francisco. Books close on the 4th. W. VAN NORDEN, President.

REMOVAL NOTICE.

Notice is hereby given that the principal office of the EUREKA GAS CO. has been removed from the city and county of San Francisco, Cal., to the city of Eureka, Humboldt Co., Cal.

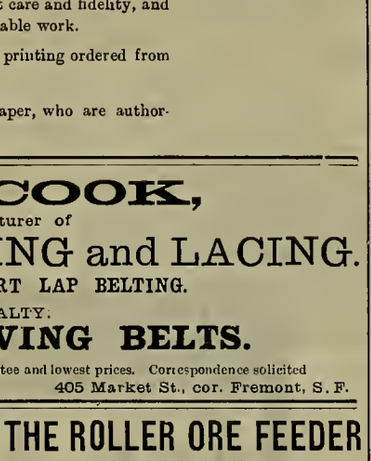
PATENTS. Thousands of Inventors throughout the Pacific Coast can and will willingly attest to the promptness, reliability and success of Dewey & Co.'s U. S. and Foreign Patent Agency. No 252 Market St., Elevator 12 Front St., S. F.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works

Sole Manufacturers,

237 Firet Street, SAN FRANCISCO, CAL

FOR SALE—TITLE U. S. PATENT.

A one-half interest, or the whole, of a valuable GOLD MINE, situated in the Quartzburg Mining District, Mariposa County, Cal. This Quartz Mine prospects from $30 to $90 per ton in gold upon the pay streak, and will pay $15 per ton, average, for all the ores. It is a 3-foot ledge, and a double compartment shaft is now down 200 feet. A mill and reduction works are now well under way; a boarding-house completed, and a water ditch, and a large part of the machinery bought and erected; roads made, etc. The only reason for selling any part is, that the owners lack sufficient means to put the property into productive shape. For further information address, GILBERT CLEMENTS, 318 Front St., San Francisco.

FOR SALE.

Patent right, with all the patterns, for manufacturing the well known Patent Square Amalgamating Pans.
Address STRONG & CO.,
10 Stevenson St.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

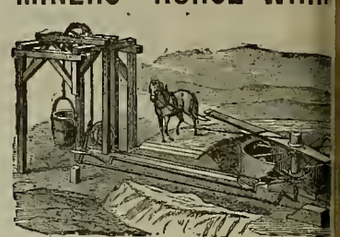
MINERS' HORSE WHIM



ONE HORSE CAN EASILY HOIST OVER 1,000 at a depth of 500 feet. The Whim is mainly built wrought iron. The hoisting-drum is thrown out of by the lever, while the load is held in place with a b by the man tending the bucket. The standard of whim is bolted to bed-timbers, thus avoiding all fr work. When required, these whims are made in sect to pack on mules.

120 in Actual Use.

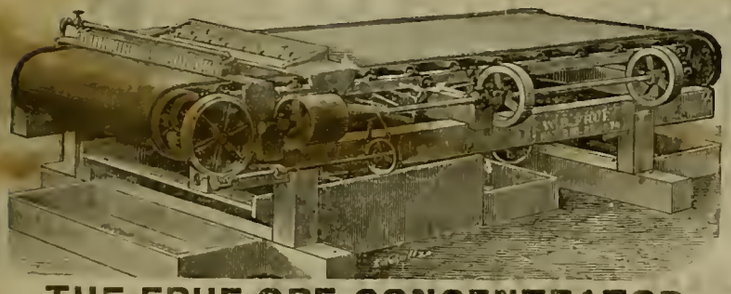
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

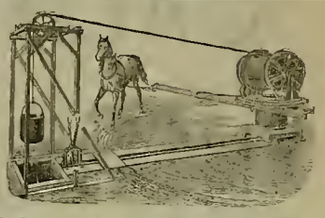
WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. Send for Circular.

Number 15.

The New American Turbine.

The accompanying cuts illustrate the New American Turbine water-wheel as now constructed. The wheel was originally made with steel buckets set into the mold and the iron run on to them. This make of wheel proved to be lacking in strength for high heads, and that mode of construction was abandoned. They are now making them in one solid casting, or in one continuous casting, in dry sand molds, the result of which is perfect wheels with even, true, smooth surface, and wheels of unquestioned strength, producing high percentage of power at whole or part gates, or part water; also wheels of great power for the diameter. These wheels are made to stand the pressure of very high heads, and at the same time produce a high percentage of power from the amount of water employed either at whole or part gates.

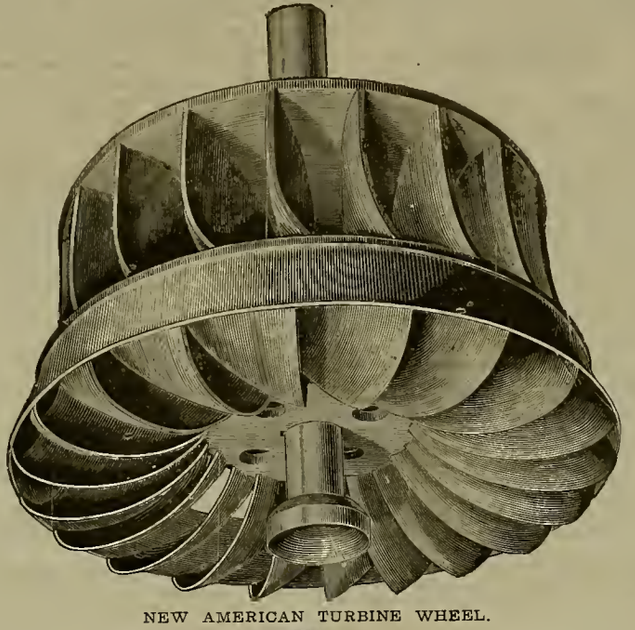
The wheel-case used in the construction of the New American is the same in its general mechanical arrangement as used on the well-known American wheel, although in a greatly improved form. An entire new line of case-patterns have been made for all sizes, and greatly strengthened. More than 2,500 lbs. have been added to the 66-inch case alone, while the wheel and case of this size complete weighs over 9½ tons. The improvement of case has been such as to be the subject of a patent. They claim that in the construction of the case with the graduated chutes they have the best application of water ever made to turbine wheels.

The gates can be operated under any head with a governor, and a perfectly steady motion given to the machinery.

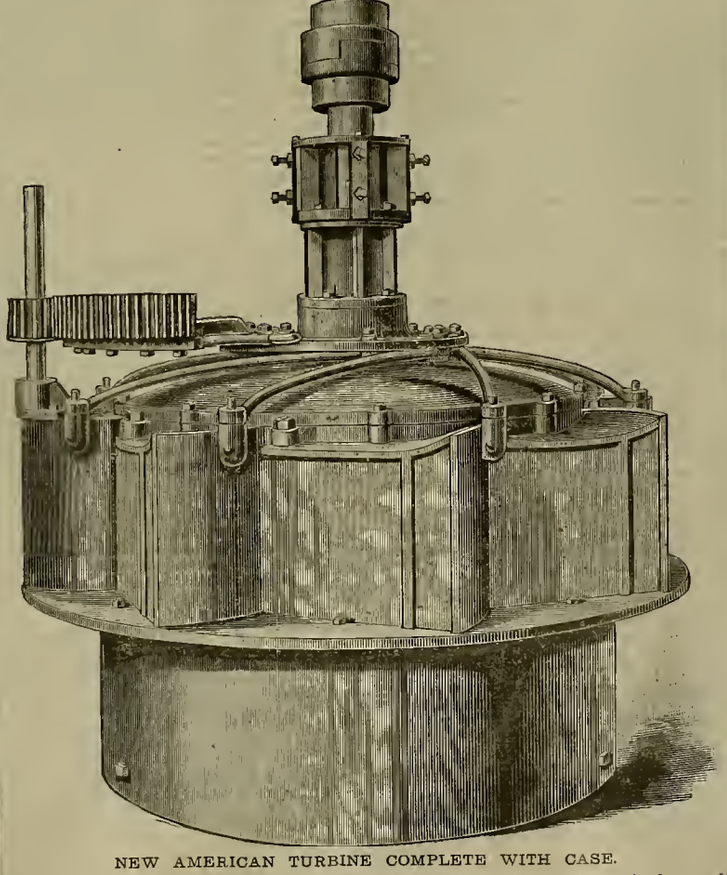
The power of these wheels to move the load at a slow motion is a valuable feature. All the machinery of a mill of 2,000 bbls. capacity, or more, can be moved so slow in starting that the motion will be scarcely perceptible, and the motion can be increased as gradually as desired, so that a belt can be put on in any part of the mill with perfect safety. These features are the same with any power and under any head. One user states that he started and stopped one of these New American Turbines eight times while the main line of the mill made one revolution with all the machinery of a 1600-bbl. mill.

This feature is due to the direct and unbroken manner in which the water is applied through the graduated chutes to the buckets of the wheels. This gradual starting cannot be done with register gate wheels. Millmen know the importance of starting up all kinds of machines gradually, and will appreciate this feature of the new turbines. It will be seen by the cuts that the new American wheel proper is of entirely new design.

Several New American Turbines have been tested at the Holyoke Testing Flume, some of which were in the competitive tests. The tests were made from full to half gates, and the manufacturers state that the New American gave higher average results than any other wheel of equal power. These wheels are made by Stout, Mills & Temple, of Dayton, Ohio, the general agent for this coast being H. H. Kryger, No. 4 California street, San Francisco. These wheels are made from 13 to 66 inches. Recently the manufacturers have built a 6-inch turbine, which will work under 3 to 100 feet head, and give from 0.26 to 50. horse power.



NEW AMERICAN TURBINE WHEEL.



NEW AMERICAN TURBINE COMPLETE WITH CASE.

THE pay rolls for March of the principal mining enterprises on the Comstock amounted to $91,246.

JUDGE ECING of Pittsburg, has decided that a store-order given by any company to an employe is illegal. The telegram does not state the grounds upon which the decision is based, but that it has been made will be a cause of congratulation to many miners.

THE new reduction works built by the Paradise Valley M. & M. Co., are said to be running splendidly. Should the works do as well as the company anticipates it is likely that very many more stamp mills will be built in that part of Nevada.

Exhibition of "Works and Labor."

In July of this year an exposition will be opened in the Palace of Industry, Paris, which will consist of an exhibition of "works and labor." It is placed under the immediate patronage of three French ministers, those of Commerce, Public Instruction and Public Works, who propose exhibiting the material of the various branches of instruction belonging to each of their departments, and as the Palace of Industry will be transformed into a bonded warehouse in order to afford a free entry to all goods sent, foreigners are invited to take part in the competition. A department for each of the following countries has already been opened: Great Britain, Belgium, Italy and Austria-Hungary.

Leon Chatteau, who was in California not long since, is general commissioner for the American section, and writes to the Mayor of San Francisco asking our people to contribute. Many interesting machines almost unknown in France might certainly be sent over for exhibition to the advantage of the American builders, who would thus find new purchases or new fields for the sale of their products. Mr. Chatteau says: "We are, moreover, convinced that models and furniture of school buildings, apparatus and instruments for facilitating instruction, the magnificent machinery used by your unparalleled fire brigades, the reproduction of municipal works, such as the service of drains and sewers, railways, canals, mines, forests, telegraphs, telephones, the military services, such as ambulances, etc., setting forth the progress made through your municipality, would prove of the highest interest and instructions for this country and the nations who have decided to come forward and compete with us in the month of July next. We shall reserve all the space that you may need in one of the best parts of the building."

Steel for Mine Timbering.

The cheapening of the cost of steel has been the cause of bringing it into use in many new channels where previously it had not been thought possible. A company in England is now making a new departure in mining operations by manufacturing rolled steel baulks and pit props as substitutes for wooded beams and props for mining purposes. Owing no doubt to the confidence which engineers can now place in this material, and also to the low price at which it can at present be purchased steel is now being used for many purposes for which a few years ago it would have been hopeless to try to introduce it. As regards its use for mining purposes, it is advocated that greater strength can be obtained, and less space taken up than with the ordinary wooden beams, and that when the life of steel as against wood is taken into consideration steel has also the advantage in the matter of ultimate cost. Rolled steel baulks and props are already finding considerable favor amongst the collieries in the Midland district, where they are being used, and they will also shortly be tried in the Cleveland mines.

Old railroad iron has been utilized to some extent in a few instances for such purposes, but its use was necessarily limited. The light steel will take up little space, and where it can be made cheap, as compared with timber, will no doubt come into greater use than heretofore, for the reasons given.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Mineral Belt of Amador County.

EDITORS PRESS:—Although it is early in the season for mines to commence working, it is nevertheless true that here in this southern end of the "mineral belt of Amador county," California, the echoes of the minsr's blast, with the pounding of the stamp mills of quartz, resound from hill to hill now daily, and have been doing so for some time; whereas only one year ago there was not a stamp quartz mill near this locality in operation. To-day no less than four different quartz mills are pounding away on gold quartz rock from as many different quartz mines here. Less than two years ago this month I was down here with Dr. Chambers, who then came here and located the ranch that now is his home; then all was a "wild wilderness" hereabouts, and people thought and said that he was out of the world nearly. To-day I eat dinner at Belle Monte cottage, upon the ranch of the doctor, and what do I find but a pleasant and comfortable home and an orchard of 500 young, choice fruit trees, 2,000 choice foreign grape vines growing here, and a number of his fruit trees are now in blossom and will bear fruit this year. There is a beautiful grove of evergreen and other shade and ornamental trees of five acres around the house, with fields cleared and fenced, making this a most desirable place and home—on the main traveled road to the Nevills or Mammoth quartz mine, only five minutes' walk from his residence, with one of the finest climates in all California. One year ago no road was near here. The Amador Canal Ditch is also surveyed and built to near the doctor's house, with a reservoir for holding water for the mines.

At the St. Julian mine, with its stamp mill, there is a good dwelling and boarding-house, and blacksmith shop, which was built at this mine a month ago. The mine is being worked night and day, with good-paying results; and the quartz mill at the Nevills mine is also pounding away daily upon rich ore. The two tunnels are being worked and pushed night and day, some 40 men being employed here. The Valparaiso mine is being worked night and day, also. A large dwelling and boarding-house, and blacksmith shop and other buildings were put up here only a month and a half ago. A 1200-foot tunnel is being run which will ere long find good, rich ore, when a quartz mill will be erected here. The 20-stamp mill at the Kelley mine is not very far off. The quartz mill at the Amador quartz mine, with an additional 20-stamp mill now building, is only 30 minutes' walk from the same point as all the other mills, and less than two miles off is the Moore mine and quartz mill that will start up as soon as the engine and hoisting works are ready, the engine now being on the ground. It will be seen that no less than six different quartz mills and mines will be working and running within one mile of Belle Monte ranch, or the Nevills mine, and with parties that would take hold of the Mammoth No. 2 mine that joins the rich Nevills mine, and open it up by sinking one or two shafts, 100 or 200 feet each, there doubtless would be added to these six mines and quartz mills another mine with a quartz mill. The Nevills, or Mammoth, mine, of Senator John P. Jones and others, ranks second to no gold mine on the Pacific Coast. To recapitulate and contrast this spot or place, where one and a half years ago Dr. Chambers built his home, and now resides here at Belle Monte ranch, will show you the great change made here in that short time, viz.: Eighteen months ago no mine or quartz mill was running or being worked, (except the Nevills, which was just starting up about that time) and to-day five or six mines and quartz mills are running and stamping out the gold, all within hearing of Belle Monte ranch and within about one mile in distance from this place. So much for the boom or impetus given to gold quartz mining between Jackson and near Middle Bar, on this "mineral belt of little Amador county," California. Rumor says that Governor Leland Stanford is going to take hold of the some of the mines in this vicinity, which it is to be hoped will prove true, as he is one of the best business men in the United States to-day.

WELLINGTON.

Sweetwater.

EDITORS PRESS:—There is considerable work going on all over this camp for this time of the year. We all know that this camp will have to come out on its own merits, there being no railroad or other transportation companies to help boom it. The present heavy discount on silver is a great drawback on mining; besides there are but a few farsighted mining men who invest in silver mines at present. They look up the best mines and get in at their new figures. They are very likely to come out on top of the pile, especially should Germany remonetize silver. Even at the present heavy discount, there are several mines here that pay well. The oldest and best prospectors have the greatest faith in the place. One of them, a good business man, and who might make lots of money in almost any place, has such faith in the camp that he digs away every day, and has been doing so for the past four years, and will do so for four more rather than weaken. Hundreds of others are just as determined.

The immediate prospect for early spring is a new mill in Sweetwater canyon (10 to 20 stamp), with water and steam power, so as to work the year round; when the water freezes it will be able to work low grade ore.

The Lookout Co. cut the lode 70 feet from the mouth of the new tunnel, where it is three and a half feet wide. In a few feet it widened to seven feet, and is still widening. The ore is a good milling proposition. They are not far from the point where they had an ore body of 300 feet on the surface which went up in the hundreds. The new owners feel very gratified over the prospect. They will put on additional force shortly.

The Kentuck have two and a half feet of ledge in the face of tunnel No. 2.

A local mining man of experience and means, is trying to get the control of the Homestake mine, Silverado canyon. There are some eight or ten owners of the mine at present.

The Comstock, a large and good mine, south of Sweetwater canyon, is said to be as good as sold to a rich company.

R. T. S.

California's Exhibit.

It is probable that the people, the products and the material developments of the grand Golden State excite more interest in the extreme South than in any other portion of this republic. The Crescent City has made an earnest attempt to acquire a fair portion, at least, of the grain shipping traffic of that great Western cereal producing region. The numerous studs of this city groan under a weight of exquisite California fruit, while every steamer that leaves this port for the West India islands, and for the extended coast of Central America, carries among its cargo boxes of California apples, grapes and pears. This traffic, which is now in its infancy, is gradually increasing, and we venture to predict that the time is not far distant when the countries that bask under the benign influence of the Southern Cross will receive the greater portion of the temperate fruits demanded by their markets, from California "via" the Crescent City.

The California exhibit, at the Government Building, is a complete study in itself, and requires several days to examine it thoroughly. The Southern spectator cannot refrain from acknowledging that the products from the progressive State are all of an exaggerated type. Its gold mines are still the richest that have as yet been discovered on the planet. Its fruits are the largest and best flavored produced anywhere. Its peaches, pears and grapes, in particular, possess a savor that cannot be excelled, while the vines of Alameda and Los Angeles produce a wine that to-day, in the opinion of many, ranks equal to any made on the famous soil of Champagne, the classic banks of the Rhine, the sunny mountain slopes of Italy, or the fertile hillsides of Sicily.

The South boasts its extended regions where a favorable climate and surroundings produce grand forests of cypresses, whose giant branches are festooned with the funereal drapery of Southern moss, but our largest trees are mere dwarfs in comparison with huge California cedars which grace the Humboldt region and the valley of the Yosemite. In fact everything, whether fruits, cereals, vegetables, trees or flowers, are of an exaggerated growth, while an examination of the flora of the State almost carries one back to the carboniferous period when the properties of the atmosphere were the most conducive to the production of the grand types of vegetation.

To the right of commissioner's headquarters is situated the mineral display, under charge of Prof. Hanks, of the State Mineralogical Bureau. This, for variety and value of specimens, if not the largest, is probably one of the most complete precious metal-bearing mineral exhibitions collected. Great care has been evinced in selections made for the display; thus our Southern people who have heard so much of the vast mineral wealth of that sister State may, from an examination of this department, form a faint idea of its actual value.

Meanwhile the people of this section claim, *with pride*, that Southern enterprise and Southern energy was partly instrumental in developing the grand agricultural, forest and mineral resources of this unique region, while the American people who recollect that the Spanish Jesuit fathers knew of the existence of placer gold mines, in different localities, and who, regaled on the glorious grapes of Los Angeles, in vain called the attention of their countrymen to the natural resources of the country, can justly boast that American enterprise and energy alone has developed its wonderful riches, and has transformed this vast Western wilderness into a blooming garden.—*New Orleans Times-Democrat.*

FIVE thousand feet of large hydraulic pipe is being riveted and put in order for the Virginia Creek Hydraulic Company. The mines will be extensively worked this season—judging from the preparations made—*Bodie Free Press.*

The New River Region.

From an extended article in the Trinity journal, the editor of which paper recently visited the New River mines, we make the following extracts.

White Rock is located about one and one-half miles below the summit of the Salmon divide, which is the northern boundary of Trinity county. It contains a hotel, one store in full operation, one just erected and another in process of erection, blacksmith-shop, stable and a number of cabins. Many lots have been sold and staked off, and additional buildings are going up as fast as lumber can be obtained. Marysville at present has a store, hotel, stable, and several cabins; other buildings in process of erection. It is about one-half mile below White Rock. New River city is located on a flat two miles below Marysville and bids fair to be the largest town of the three from the fact that it has more room to spread. The townsite contains 40 acres which has been surveyed and laid out in streets and blocks. Land is considered scarce and the streets are to be only 50 feet wide—too narrow, as the first fire will surely prove. Here is located the saw-mill of Yocum & Co., which is in full blast and has orders two or three months ahead. The New River Development Company will at once erect a large hotel at this point and special inducements will be held out to have business men settle there. It has the other advantage of being below the mines, and men would always rather walk down hill than up after a day's work All the towns are bound to thrive for a long time.

Routes of Travel.

There can be no doubt but that several thousand men will visit the New River mines during the present spring and coming summer, and to these the question as to which is the best route is one of much importance. A great deal has been printed and written in support of each of the several roads by which the mines may be reached, and while we have ever been honest in the belief that the route *via* Weaverville was the shortest, quickest and cheapest, we are more than ever convinced of the correctness of this view since going over the line. Leaving White Rock at 7:30 on Thursday morning and laying off two hours to allow animals to feed, Rattlesnake was reached at 4 in the afternoon, the actual traveling time being six and one-half hours and the distance not to exceed 17 miles; this over a somewhat circuitous route with much more up-hill and down-hill travel than is at all necessary.

A knowledge of the country leads to the belief that a good graded trail can be made from the mouth of Rattlesnake creek to White Rock in a distance of less than 15 miles—possibly not more than 12 miles. Leaving Rattlesnake at 6:45 Friday morning, North Fork was reached a few minutes before noon; two hours were spent there, another hour at Junction City, and Weaverville was reached a little after 6 o'clock in the evening. The distances from Weaverville are as follows: Wagon road to North Fork, 15 miles; splendid trail, traveled for many years, to mouth of Rattlesnake, 20 miles; new trail to be built at once to White Rock, 15 miles; total distance from Weaverville to New River mines, 50 miles—and no further. As to cost, taking San Francisco as the initial point, the fare is as follows:

To Redding by rail	$9 05
" Weaverville, stage	7 50
" North Fork, wagon	2 00
" White Rock, saddle	10 00
Total fare	$28 55

We have no word of condemnation regarding other routes to the mines. Eureka and Etna each have fair trails. Many Humboldt people are interested in the District, much of its business is in their hands, and as they go only to Eureka that will be their route. Siskiyou county will undoubtedly supply the district with flour, cured meats, feed and many vegetables, and a direct road to this promising market was a necessity which they were quick to see. But when it comes to a road for general travel, neither of the others can compete with the Weaverville route and their strongest advocates cannot truly claim otherwise if once acquainted with the "lay of the land." This is the natural outlet, and should the mines prove sufficient to justify the building of a wagon road for the transportation of machinery and other freight, it must be built by the way of Weaverville. No other is practicable. This is neither blow nor bluster; it is the cold, clean fact.

New Trail at Once.

Recognizing the importance of immediate action in the matter of building a good graded trail from Rattlesnake to the mines, the editor of the *Journal*, in company with Messrs. Jacob Paulsen and C. W. White, canvassed Weaverville last Monday morning, and in an hour's time succeeded in raising by subscription $512.50 for the purpose named. This amount has since been raised to $630, and will be further increased by other donations here, at Junction City, North Fork and other points until the amount reaches $800, or even more. This will build the 12 or 15 miles of trail needed to make the through connection, on an easy grade and in splendid shape, and will place Weaverville within one day's travel of the New River mines. The trail will be built without delay, and when completed lower rates of fare may be expected from Redding to the mines. When the advantages of this route are understood, it is certain that the great bulk of general passenger travel must come this way.

Since the above was in type, several of our prominent citizens, having a direct interest in travel to New River, have canvassed it thoroughly and agreed to place matter of building the trail in the hands of Mr. James Mullane. Work will commence next week, and rushed to completion. By the middle of April, or possibly a few days later, a good trail on a wagon-road grade will be put through to the New River mines. In the meantime, we can assure travelers that there is now no difficulty in reaching the mines from Weaverville, and that the trip can easily be made from this place.

Pocket Mining in Tuolumne.

Pocket mining is practiced here with varying success. Ever since the unearthing of the Divoll pocket in the Bonanza mine, situated in the town of Sonora, pocket mining has been prosecuted with untiring zeal by many who were anxious to take the rapid road to wealth and amass a fortune in a moment, as did Mr. Divoll and his three lucky partners. This kind of mining is peculiar in many respects. In the first place, a man must be to a certain extent adapted to it; in fact, pocket miners are born, not made; second, he must have patience and perseverance, and third, he must have a grub stake to begin on. Indications of a pocket are sometimes favorable for a long time before the pocket is a reality, and in many instances the prospector finds the bottom of his own pockets before he finds his ore pocket indications, or before his indications turn to a reality. The Divoll pocket was, perhaps, the largest ever found in the State, and made the three finders independently rich. After taking out a large amount the party ceased operations for a time, but about six months ago commenced running a tunnel to drain the mine. The tunnel will also be used as a tramway. It is the intention of the company to sink the shaft to a greater depth in anticipation of finding another pocket. When Divoll & Co. made their lucky strike a few years ago, others were led to explore the recesses of the earth for more hidden treasures, and an impetus was given to pocket mining, which has not abated, although many have been compelled, through adversity, to desist for a time, only to renew their efforts when they had acquired funds through other channels. In this way several pockets have been taken out quite recently. The largest one fell to the lot of David Oliver and Michael Shine, who, it is said, took out $36,000, one chunk weighing ten pounds. Another pocket was discovered by a party of Austrians not long ago, the full value of which is not yet known, owing to the fact that the discoverers have not taken out all they have in sight. Several small pockets, ranging in value from $100 to $1,500, have also been discovered.

In most cases the prospectors do not own the mines themselves, but lease the right to mine on the land, most of which is patented for agriculture or is in private hands.

This Summer's Water Outlook.

Owing to the scarcity of rain this winter, the coming summer's outlook for water for milling purposes is not at all favorable. The scarcity of rain has caused the water to fail in the streams at least six weeks' earlier than usual, and unless there is a good supply of rain this spring the water will be exceedingly short before the last of May. There is very little snow in the mountains.—*Cor. Bulletin.*

The "Novelties" Exhibition.

The announcement of the managers of the Franklin Institute of their intention to hold another exhibition in Philadelphia during the autumn of the present year will be news of interest to all our readers. The Electrical Exhibition of last year was an unqualified success in every way, and was most creditable to this useful and venerable institution, and to all who were concerned in it.

The managers have decided this year to hold an exhibition of a more popular character. It will be known as the "Novelties" Exhibition, and will be devoted, as its title indicates, to the display of such recent inventions, improvements and discoveries in the arts and manufactures, as may be deemed worthy of admission.

It will afford our inventors and manufacturers an excellent opportunity of bringing to public notice their best and most recent achievements. That the character of the forthcoming event will undoubtedly be maintained up to the highest standard of excellence goes without saying, and our people may look forward to the "Novelties" as a rare source of interest and instruction.

From the announcement of the managers, the "Novelties" exhibition will be opened on Tuesday, September 15th, and will be closed on Saturday, October 31st.

THE trustees of the eleventh provision of the Lick Trust have paid $35,000 for a site for the free public baths, on the northwest corner of Tenth and Howard streets, 250x125 feet in extent. The trustees intend to push the construction of the baths to a speedy finish.

MECHANICAL PROGRESS.

The Rising of Steel During Rolling.

It has been repeatedly observed that rolled-steel ingots rise more or lose in the reheating furnace, making the continuance of the rolling impossible. In other cases this rising happens only in the finishing rolling. Dr. F. C. G. Mueller, Brandenburg, Germany, has had occasion recently to study this phenomenon more closely, and reports the results of his observations in *Stahl und Eisen*. At one of the German basic steel works a 1200-pound ingot of the ordinary section was broken down previous to rolling into an eye-beam. When it was put back into the reheating furnace it began to rise over half its length, and was taken out and put aside. Later it was drilled into under water, the gas inclosed in the cavities, contrary to all expectations, showing no pressure. It was analyzed by Dr. Mueller, and found to contain:

	Per cent.
Hydrogen	43.0
Nitrogen	28.5
Carbonic oxide	27.2
Carbonic acid	1.6
Oxygen	
Total	100.3

Later the ingot was sawn in two at the point where the steel had swelled most. Dr. Mueller gives a fac simile of the section of the swelled ingot, showing clearly two enormous cavities grouped symmetrically around a central core of sound metal, and connected in their upper part by a narrow channel. The two corresponding sides of the ingot had strongly bulged, and the concave form of the other two, with the four corners of the ingot sharply twisted, clearly illustrate how powerful the gas pressure must have been. Dr. Mueller attempts to explain this phenomenon in the following manner: All Bessemer steel, and particularly basic steel, contains many times its volume of inter-molecular gas. Although this gas has a tendency to escape, the cohesion of the metal does not allow it. It is a different thing with unsound ingots, and the particular form of porous ingot is that where lies between the sound core and the sound shell a layer containing a large number of blow-holes. When such an ingot is being broken down, the mechanical action of rolling tends to crush this layer or zone, and the outer shell separates from the core. During reheating the compressed gas succeeds in bending the shell outward, and causes the swelling or bulging. The absence of pressure of gas in the cavity when drilled into is remarkable in the face of all evidences of high pressure. Dr. Mueller believes that the gas must have escaped in the furnace, and that during the heating of the ingot a part of the gas must have diffused through the walls of the cavity. Since hydrogen diffuses most readily, the comparatively low percentage of that element in the gas analyzed is explained. He attributes the swelling of steel in the rolls in rolling sheets to the same causes. In an ingot with an unsound core while it is being rolled down there is too much thickness of metal to allow the gas to escape. But, as the sheet grows thinner, the resistance to the expansion of the gas becomes less, and it finally causes the sheet to swell. Dr. Mueller quotes an instance in which this occurred at the seventh pass in the sheet mill, breaking a weak roll. In rail mills blisters are often noticed appearing on the web of the rail. All these phenomena Dr. Mueller attributes to the one general cause—the pressure of gas originally in the ingot in casting.

How to Balance Planer Knives.

An experienced mechanic gives the following instructions concerning the balance of knives: All prominent knife manufacturers understand the importance of having each of the two, three or four knives of a set exactly the same length, width and thickness, and if made properly they will weigh the same. Now to be in balance they must be kept so by grinding the bevel. Do not chip off the heel or chip out the slot to make them weigh alike, for they will not be a running balance. If you should get a nick broken out of one of your knives, set that knife back the least trifle and it will not show on the board, or grind them all down alike on the bevel. A short time ago we were called to see what was the matter with a planer which the parties claimed would not do good work. The planer was new, had been in use but a few months, and a fine machine. We threw off the cylinder belts and examined the head, a three-side; it was loose in the boxes. On examining the knives we found two of them with notches slipped between the slots on the heel. It seems they had broken a notch out of one knife and ground it out, and chipped notches in the heels of the two to make them weigh alike. It would simply be impossible to do good work with a machine in this condition.

THE IRON INTEREST IN ENGLAND.—The English correspondent of the *American Manufacturer*, of a late date, says: The rails which the country sent away to export customers last month were of the value of £153,631, whereas the value of those exported in January last year was £213,202. Seven markets have not taken a single rail. These are Russia, Sweden and Norway, Germany, Holland, Spain and the Canaries, Italy and Egypt. The increasing markets are Chili, Peru and British North America. All others have fallen off very seriously. The United States and Mexico show worst of all. The anomaly in the iron business which all ironmasters feel is the high wages which the organizations of millmen are able to enforce. The rates of payment are far higher than they ought to be, considering the work that is done by the recipients and the profits of the masters. Yet the millmen's organizations are showing renewed life, and whether in Staffordshire or the North of England, attempts to reduce the present high scale threaten to be attended with much difficulty in localities where the works are numerous. A less unyielding spirit is being shown where the works are few. The 150 hands employed by the Newton Iron Works, Staffordshire, have consented to slightly reduce wages, and their employers have decided to again start the works which they had closed for a short time.

IMPROPER LOCATION OF THE BOILER FEED.—The evil results likely to arise from the improper location of the feed, or rather, perhaps, we should say the delivery of the feed water into a boiler at the wrong place, are more serious in their character and greater in extent than is generally known. It is no unusual thing, in fact, we might almost say that, as a rule, if plain cylinder boilers are fed with cold water through the bottom of the shell, and no provision is made to allow of its thorough incorporation with the water already in the boiler, and assuming the temperature due to the steam pressure, before coming in contact with the bottom plates of the boiler over the fire, these plates will crack through the girth seams, and the owner is fortunate if the boilers do not explode. The force of contraction under such circumstances is irresistible. It is very bad practice to put up cylinder boilers and introduce the feed through the mud drum. It should enter the boiler and be delivered just below the water line. By this means it mixes with and attains a high temperature before it comes in contact with the shell plates, and much trouble is avoided.—*The Locomotive.*

GRAPHITE AS A LUBRICANT.—The use of graphite, sometimes styled plumbago or black-lead, is becoming greatly extended as a lubricant, for the lessening of friction and heating of journals. For this purpose it is growing rapidly in favor. For lubricating purposes none but the very best plumbago will answer. It must be pure and free from grit. This purity is attained, not by bolting it, but by floating the plumbago in either air or water. The water method is simplest, and during this process it is treated with a bath of dilute sulphuric acid which takes up the particles of spar and iron, leaving the sulphates of lime, magnesia and iron easily washed out. For metal bearings the plumbago should be used with oil, but for wood bearings, after a few applications of oil and plumbago, the oil may be dispensed with, and the dry powder only used. On hot axles or journals it should be applied freely dry, then oil up as usual. Although plumbago was used for this purpose more than 200 years ago, the true method of preparing it was not known until within a few years, so that it comes before the public almost as a new material.

DIVISION OF POWER.—The old-time notion of one immense central engine to furnish power for an entire large establishment is getting out of date. The change is to independent engines for each department, so that one may be stopped for repairs, or from slackness of work, while another may be run without carrying the load of the connecting shaft and pulleys. This is true economy, for sometimes the requirements of a really large establishment may be met by the power of a small engine—perhaps twenty horse power serving for an establishment that requires in its entirety not less than one hundred and fifty horse power. It is best, also, that the steam should be furnished by independent boilers, and not from one battery of central boilers. In short, the change demands, for convenience and economy, the existence of separate engine and boiler plant for each department, the whole to be connected if required.

STEEL INSTEAD OF IRON FOR CARD TEETH.—The manner in which steel is taking the place of iron in all directions is further illustrated by the use of hardened and tempered steel wire upon cards for cotton and wool. The average life of a suit of card-clothing upon cotton is six years, and upon wool considerably less than that. The use of steel wire in place of iron has not been tested long enough to determine its comparative durability; but it is claimed to do better work, and to require less frequent grinding, and hence textile manufacturers are willing to pay the increased cost, amounting to from 50 to 100 per cent above that of the common iron-wire clothing.

THE FONTAINE LOCOMOTIVE.—The Fontaine locomotive, which won peculiar celebrity some time ago on the line of the Canada Southern, has finally disappeared. The central idea was the introduction of two friction wheels above two driving wheels. By the contact of the upper wheel with the lower a greater number of revolutions per minute, and hence greater speed, could be obtained. A company was formed with $1,000,000 nominal capital stock at $25 per share. Two engines were built at an expense of $25,000, but they proved failures. Altogether the company paid out $645,000 and received $2,700 in return.

SCIENTIFIC PROGRESS.

Why the Wind Changes.

A careful scientific study into the causes operating to produce the varying changes of the wind is of much practical importance. A late writer in *Cassell's* magazine says that the changing of the direction of the wind is due to the shifting of the situations of the greatest heat upon the earth is substantially proved by the fact that in certain regions of the earth's surface, where the situations of the greatest heat and cold do not alter the direction in which they lie to each other, the wind does not change, but always blows in the same direction from one day to another, and all the year round. This occurs in the great open space of the ocean, where there is no land to get heated up by the sunshine of the day, and to get cool by the scattering of the heat at night. In those spaces, for a vast breadth of many hundred miles, the sun shines down day after day upon the surface of the sea, heating the water most along the mid-ocean track, which lies immediately beneath its burning rays as it passes across from east to west.

This midway track of the strongest sunshine crosses the wide ocean as a belt or zone that spreads some way to either side of the equator. Throughout this midway track the cooler and heavier air on either hand drifts in from the north and from the south, and then rises up, as it becomes heated by the sun, where the two currents meet. In both instances, however, in consequence of the spinning round of the earth, the advancing wind acquires a westward as well as an equatorial zone, where the onward movement of the sea-covered surface of the earth is performed with the velocity of a thousand miles an hour, does not immediately acquire this full rate of speed, and lags back upon the ocean, so that it appears as adrift toward the west as well as toward the equator.

On the north side of the equator the wind blows all the year round from the northeast and on the south side from the southeast, both in the Atlantic and Pacific Oceans. These steady and unchanging ocean winds are called the trade winds, on account of the great service they render to ships carrying merchandise across these portions of the sea. In sailing from England to the Cape of Good Hope, through the entire length of the Atlantic Ocean, ships, before they reach the equator, have to pass over a broad space, where the strong winds are always steadily blowing from the northeast. That is the region of the northeast trades. They then traverse a space near to the equator itself, where the northeast wind ceases to blow, and where the air is very still and calm, and they afterward come to a region south of the equator, where south winds are continually blowing from southeast. That is the region of the southeast trades.

SMALL STORAGE BATTERIES.—A New York company is now manufacturing practical electrical storage batteries of various sizes and prices. The smallest size made, which costs five dollars, is about as large as a powder flask, and weighs half a pound. Its power, when charged, is sufficient to run a four-candle lamp for four hours. To recharge costs twelve cents. Its chief use will be for the lighting of very small lamps, the smallest about the size of a bean or the head of a shawl pin; such lamps are used by surgeons for examinations. The next size of battery is in the shape of a cube about six inches square, and weighs two pounds. Such a battery, costing $12, will feed a desk lamp for ten hours at a cost of about twenty-four cents for charging. The next size of battery, 12 inches by 16 by 9, is intended for carriages, and will give current enough for two outside lamps and one inside for four hours a day for ten days; the cost of recharging will be thirty cents. For running sewing-machines a battery is made measuring sixteen inches each way and weighing twenty pounds. It will run a sewing-machine for a month, and cost a half-dollar to charge. All such batteries are warranted to last two years.

HEAT RAYS SEPARATED FROM LUMINOUS RAYS.—French experiments have resulted in the discovery of a method of isolating the heat rays from any source, intercepting the illuminating and chemical rays. A piece of glass has dropped upon it a drop of melted and sublimated selenium, which is immediately covered by a thin glass, and the melted material is then squeezed gently until it is extended into a very thin, homogeneous sheet. The glass is then placed under pressure and gradually cooled. It is necessary that the selenium should not boil on the glass, or, otherwise, cells are formed by means of the vapor, which interfere with the action of the material. When properly made, the cell is of uniform thickness, and free from bubbles and striations. Cells thus constructed, when placed in the path of a ray of light, reflect the chemical rays, and convert the luminous ones into electrical energy: only the calorific rays pass through the cell, being at the same time subjected to a definite refraction. The transmitted light is monochromatic, of a ruby-vermillion tint, only showing one luminous band in the spectroscope.

THE SCIENCE OF MICROBIOLOGY.—The chair of a new science has been added to the teaching machinery of the Sorbonne. France has followed the example of Germany in raising microbiology to the rank of a recognized science. The establishment over which Dr. Koch presides in Berlin is the completest and best equipped in Europe. He has four army surgeons as assistants, and some sixty or eighty students, among whom are not a few savants of standing, are daily pursuing their researches in his laboratories. Dr. Koch, who was a modest veterinary surgeon in Breslau four years ago, and who has never had a regular academical training, was looked upon with distrust and jealousy by the German universities when his studies in bacteriology brought him into prominence and won him the support of Prince Bismarck and the favors of the Government; but the opposition to his methods and theories has nearly altogether subsided, and he was named professor in the medical faculty of Berlin a fortnight ago. M. Duclos, one of the most distinguished of M. Pasteur's pupils has been appointed first professor of microbiology at the Sorbonne.

CONSTRUCTION OF OBSERVATORIES.—In the construction of buildings devoted to the purpose of astronomical observations, the most important requisite is to provide against the effects of vibration on the apparatus. Any contact with the floor or other portion of the building would not fail to produce, upon the slightest movement, concussions which, multiplied by the magnifying power would render the telescope useless. The mode of adapting the building for its peculiar use is by rendering it independent in all of its parts of the piers upon which the instruments are fixed. The foundations of the latter are also laid as deep as possible, in order to obviate the effects of vibration from external causes, against which, however, it is not always practicable to guard, the mere tread of a foot passenger being often sensible to an observer using a powerful telescope at a considerable distance.

AN ICEQUAKE.—The town of Madison, Wis., lately had a tremor which was due not to a social or other earthquake, nor yet to a dynamite explosion. A disturbance which shook the University buildings was caused by the expansion and contraction of ice in Lake Mendota. Under the influence of intense cold the ice had expanded until the shores could resist the pressure no longer, when the ice burst and doubled up about 400 feet from the shore, and ou a line parallel with it. The sudden release of the shores from pressure caused the tremor. This phenomenon of freezing upon bodies of water having low shores frequently results in the piling up of rocks on the edge and the overturning of trees. The shore line of lakes frequently consists of gravel mounds forced up during successive winters.

SECURING AN ANTARCTIC DISCOVERY.—The Hartford *Times* tells the following: Capt. Nathaniel Palmer of Stonington, the original discoverer of Palmer's land, farthest south of all known land, tells the following way he saved the discovery. He was getting ready to leave it when a Russian frigate hove in sight. Capt. Palmer was ambitious to secure the land for the United States. How to contend with the ship of the Czar he did not know at first. He waited till the frigate ran to the leeward of him and hove to, and then he put up his sheet and squared away for her, running under her stern and calling out as he shot past: "Ahoy, there! ship ahoy! do you want a pilot in?" The ruse succeeded, for the Russian at once filed away and left the dominion free to the stars and stripes.

IN THE LABORATORY, in obtaining a temperature higher than that of the boiling water or of oil, the use of a sand bath has usually been resorted to by chemists. As this method, however, is characterized by certain drawbacks or deficiencies, sand being a very bad conductor of heat, a German chemist has recently proposed as a substitute the employment of pounded fragments of graphite; these have the property of letting the heat pass much better, do not oxidize and have no soiling effect on the inclosing vessel. *L'Electricite* admits the advantages presented by this mode to electricians who have to make researches in thermo-electricity, adding that small shot of iron would serve nearly the same purpose.

CHEMISTRY, which, like other sciences, has been wonderfully developed during the past century, is often mentioned as of recent origin, but many chemical facts were known to the ancients even before the dawn of historical times. Specimens of their work still in existence indicate that the ancient Egyptians had considerable chemical knowledge. They were skilled in smelting ores and working metals, had a good understanding of dyes, made glass and knew how to prevent decomposition of dead animal matter, while the priesthood evidently had some idea of pharmaceutical chemistry.

CROCODILES are the only reptiles whose nostrils point in the throat behind the palate, instead of directly into the mouth cavity. This enables the crocodile to drown its victim without drowning itself, for by keeping its snout above water it can breathe while its mouth is wide open.

MILK.—The milk of carnivorous animals is acid, that of the herbivorous alkaline.

Passing Events.

The abundant rains of the past week have extended over the State, and have insured a prosperous year for California.

More business has been done in mining stocks this week than for many months past.

San Francisco and Oakland had the somewhat curious experience of a thunder storm on Wednesday evening, and by many it was considered the most serious which ever occurred in this locality.

A very large number of men are now employed on the Comstock, and the pay rolls are summing up to an aggregate of about $100,000 a month.

The Idaho miners' wages troubles still continue and unsettle mining matters in that region.

Very shortly now the prospectors will start out on their trips and begin the summer's work in the mountains. The snow will be gone before very long, except on the high mountains, and will give these men an opportunity to pursue their work.

The owners of the Eureka mills are about to construct a tailings mill with slow-motion slum pans to work the slums and tailings that have accumulated near the sixty-stamp mill.

United States Patents.

The Patent Office of the U. S. Government received during the year 1884, from the inventors of the country, the enormous sum of $1,075,799. During the same time the expenses of the office were $970,580, leaving an excess or profit of $105,219. A summary of the work of the office for the year shows that there were issued 20,297 patents and designs; that 116 patents were reissued; and that 1,021 trade marks and 513 labels were registered; 12,301 patents expired during the year, and patents were withheld in 2,839 cases for non-payment of the final fee. Of the patents issued, 19,013 were to citizens of the United States and 1,284 to citizens of foreign countries.

In view of the fact that the work is paid for by the inventors and the Government is put to no expense on their account, but really makes money out of them, the facilities of the office should be improved so that applications would be more quickly acted upon than is at present the case. The Commissioner himself calls attention, as he has done before, to the inadequacy of room and facilities for conducting the business of the office, and to the unfitness of the rooms now used for occupation by human beings. He also calls attention to the insufficiency of the facilities for conducting examinations, and recommends that an appropriation be made for a laboratory and such appliances and fixtures as are necessary. He asks that the force of examiners be largely increased, stating that the present force is inadequate. In connection with this matter he says: Many important interests are lost or greatly damaged by reason of the inability of inventors to have their applications disposed of within a reasonable time.

This is strictly true, and is a cause of much complaint among inventors, as the matter has been getting worse for some years. Greater promptness is required. Men who have made inventions after months of thought or experiment are anxious to obtain their patent rights, and are inconvenienced seriously by having to wait several months before an examination even is made in Washington. People who are helping them get tired of waiting, and the man himself is perhaps discouraged. There surely must be a remedy for this. If the old proverb about the new broom is at all correct, perhaps the new Commissioner of. Patents will make such arrangements to facilitate the public business as will accomplish better results. A force of perfectly competent men, with no idle political favorites among them, ought soon to catch up with back business, and in the future keep even with it. Were it not a fact that this is perhaps the only Department of the Government which is self-supporting and really profitable, there might be some excuse for the delinquencies, but the facts being as we have stated, excuses are not received good-naturedly.

Size of Telescopes.

At the last meeting of the California Academy of Sciences, Professor Davidson presided. He stated that he had conversed with a number of astronomers, during his recent Eastern visit, and it seemed to be the general opinion that the limit of size of telescopes had been reached for observations of precision. The largest telescopes had the advantage of collecting more light, but as precise observations could not be made with them as with smaller instruments. This was due to inherent defects in all large instruments. In all large telescopes certain great mechanical difficulties are met with. The great size of the disks of glass, causes them to slightly "sag," or become "deformed," when placed horizontally, which would not be the case when vertical, and the sagging would alter with the curvatures, which naturally interferes with the exactness of the image at the focus. In fact it seemed that the best work of precision was being done with six, eight or ten-inch glasses, although fine work is done with the present large one.

While East, Professor Davidson had called on Alvan Clark & Sons, who are grinding the glass for the large Lick Telescope. He saw the flint disk they had completed. The few defects were contained within the aggregate area of a square inch, and would have no evil effect. They had received word from Feil & Co. of Paris that work was being prosecuted on two crown-glass masses, one of which it was hoped would be found satisfactory. There have been nineteen failures already, however, so they could not be sure of those under way.

Iron in California.

Although we have only one iron mine in this State which has a plant for producing pig iron, there are many deposits and beds in California. The northern, central and southern counties all have their iron deposits, but, as stated, in only one case have we utilized this natural resource. It was not until 1880 that active steps were taken to develop the Clipper Gap mines in Placer county, and for some few months they were shut down, owing to the low price of the product. Still few counties consume so much iron in proportion to their population as California, notwithstanding this metal has here always commanded extra high prices. This comparatively large consumption grows out of our considerable requirements for mining purposes, and the extent to which we employ this material in building houses, fences, bridges, etc., the high prices we have had to pay for it being due to the fact that our supplies have been imported from distant sources of production, subjecting them to heavy freights and other charges, and compelling dealers to keep large and varied stocks constantly on hand. Years ago demands sprang up for the outfitting of quartz mills, hydraulic plant, etc., the growth of such demands keeping pace with the expansion of these several branches of mining. The substitution of iron pipes for wooden flumes for conveying water across rivers, ravines, and other depressions, has also called for a good deal of iron. Then came the era of railroad construction, adding immensely to other causes of iron absorption, all of which have kept on year by year, undergoing steady enlargement. Besides supplying the Pacific States and Territories, our shops and foundries have turned out great quantities of mining machinery and castings for northwestern Mexico, South and Central America, and British Columbia, with some products in this line for China, Japan and the islands of the Pacific, the Hawaiian sugar planters having here obtained all their mills, pans, etc. But with requirements so great and the raw material of superior quality scattered abundantly all over the State, not, as we have said, until recently were any well directed and effectual efforts made to manufacture iron in California, the cost of production and fear of foreign competition having deterred even the most enterprising from undertaking it.

Aaron's Assaying.

Mr. C. H. Aaron, the well-known metallurgist (author of "Testing and Working Silver Ores," "Leaching Gold and Silver Ores," and another work on "Assaying"), has issued this week parts two and three of the latter, as a separate publication. Part first was entirely devoted to gold and silver ores. Parts second and third (in one volume), refer to gold and silver bullion, lead, copper, tin, mercury, zinc, nickel and cobalt; and there is also an appendix to parts first and third.

The work, which is published by Dewey & Co., of the MINING AND SCIENTIFIC PRESS, 252 Market St., comprises some 160 pages. It is designed not so much for the use of students who enjoy the advantages of professional instruction, as for that of people who want to assay—whether for business or pleasure. The methods and processes are described in plain language, free from chemical formulæ, in a manner to be readily comprehended, which is, by the way, one of the secrets of the success of Mr. Aaron's former works. His descriptions are clear and plain, and there is no mistaking any directions, which, when followed strictly, lead to proper results. The book will be found of great aid in learning. We shall, from time to time, make extracts from it. The price ($1.75), is sufficiently low, to enable any one interested in such mining or metallurgy, to purchase it. The book is compact and might have been extended to much greater dimensions—after the manner of many scientific publications—without increasing its usefulness. It was considered best to keep it of a convenient size for ready use by workers.

In another column of this number of the PRESS is a description of a melting furnace taken from the chapter on "Apparatus,"

The Launch of the Arago.

The First Steel Steamer Built on the Pacific Coast.

A very important event from an industrial point of view occurred on Thursday of last week, when the steamship Arago was launched from the new shipyard of the Union Iron Works on the Potrero. The Arago is the first steel steamship ever built on the Pacific coast. The launch attracted a very large number of well-known and prominent citizens. It was quite a compliment to the builders that so many ladies and gentlemen should have come to see the results of their work, for no such gathering of representative people ever collected here before for a purpose of similar nature.

The Arago is an ocean steamer of 750 tons register. She is 207 feet long ever all, 200 feet on the water line, 30 feet beam, and 16 feet depth of hold. Loaded she will draw 12 feet 5 inches. She is built entirely of steel. She has four water-tight bulkheads and a water ballast tank under her engine and boilers, making six water-tight compartments, each independent. Being especially designed for the coal trade, she has large hatches, which greatly facilitate loading and discharge. She will carry 1,000 tons of coal, and was built for the Newport Coal Company, whose coal mines are at Coos Bay, Oregon.

The steamer is of graceful model, though the lines are full and well adapted for the purpose for which she is intended. The work upon her is well done and neatly finished, and the builders are to be complimented in turning out a handsome vessel.

The engines were designed by George W. Dickie, manager of the works, and are direct-acting inverted-cylinder surface-condensers, with cylinders respectively of 24 and 48 inches, 38-inch stroke. The propeller is 10 feet 4 inches in diameter, and the propeller shaft 9 inches in diameter. The boiler is 16 feet long, 8 feet and 6 inches wide, 15 feet high and designed for 100 pounds pressure. In each end are 2 furnaces of 38 inches diameter, and 5 feet 6 inches long; also, 348 return tubes of 3 inches diameter. The shell is of 9-16 mild steel, stamped 60,000, fitted with butt straps outside and inside, and all hydraulic riveted.

Although the steamer is a collier, she will be arranged to carry 42 first-class passengers and 24 steerage. Her deck-houses are so far only in frame.

The Union Iron Works have very complete arrangements for building and launching vessels. The vessel was built under a permanent scaffolding, arranged with overhead traveling cranes and all the necessary appliances for readily handling and placing material.

Just on the dot of the appointed hour the dog shores were knocked away and the vessel slid smoothly down the ways, and took the water amid the shouts of the assembled crowd on the adjacent wharves. Everything went smoothly and there was no accident or delay.

The steamer was brought up gradually by the lines, and then a tug brought her alongside the wharf so that those who desired might go aboard and inspect her. As soon as she was properly moored, her engines, weighing 47 tons, were hoisted from the wharf by the immense iron steam shears and lowered into the hold in position. These shears are the only ones of the kind on this coast, and the largest in the United States; the only other pair of this form being in the yard of the American Ship Building Co., at Philadelphia. They are capable of lifting 100 tons. They were built at the Union Iron Works, and were first used for placing the 80 ton boilers of the steamer *State of California*.

The two forward legs of the tripod are hinged at the lower ends, and the rear leg has at its lower end an internally threaded follower block which moves on a long screw operated by the engines. On revolving the screw, the follower is brought forward, carrying the lower end of the rear leg, which of course pushes the upper end the tripod over. The engines having previously been hoisted high enough to clear the rail of the vessel, when the crane was inclined it brought them over the hold, where they were readily lowered into position. This operation was watched with great interest by the spectators, and occupied 20 minutes. The week the 43-ton boiler was put on board by the same means. It was taken from the dock at

placed on its bearings in the ship in 16 minutes.

At the conclusion of the launch, the visitors were invited to partake of a fine lunch, and to inspect the new and extensive plant of the works. The site is a very convenient and spacious one, with fine water-front privileges, and in a splendid place for ship-building. The works are in a position now to repair or build vessels of every kind or size, and the necessary appliances having been procured for the purpose. Experienced designers and builders are connected with the works, and it is the intention of the managers to build up this branch of the business, which has heretofore been neglected on this coast. It only needs the addition of a set of plate rolls to make us entirely independent of the East in the matter of ship-building.

During the launch the proprietors of the works were kept busy explaining and answering questions and entertaining their guests. The officers of the Union Iron Works are: G. W. Prescott, president; Irving M. Scott, general manager; H. T. Scott, vice-president and treasurer; G. W. Dickie, manager; J. O. B. Gunn, secretary; and Geo. E. Ames, agent. The new vessel was built entirely of steel; the keel, stem and stern posts having been forged at the steel works of the Pacific Rolling Mills. The entire construction was carried on by the Union Iron Works. They are to be congratulated in having built up the most extensive industrial establishment on the Pacific Coast, and one which is in a position to greatly enlarge its former sphere. The buildings are all new, and many new improved appliances have been procured, in addition to the extensive plant they had at the old location in the city proper. There are no jobs of iron work which these works are not now able to undertake and accomplish.

Melting Furnace for Assaying.

The following description of an assayer's melting furnace is taken from Aaron's new work on "Assaying," just issued:

A melting furnace suitable for light work may be bought ready made, and is similar to the crucible furnace for ore assays. For heavy work, such as casting large bars, it is best to build a furnace of masonry, and, though not customary, it is advantageous to have it sunk in the ground to within about a foot of the top. The accompanying diagrams and description represent an excellent melting furnace, which the writer has built in silver mills.

This furnace is suitable for a number 30 or 35 black-lead pot, with charcoal as fuel. There is no heavy and expensive cast-iron plate on the top, and the cover may be of sheet-iron, although cast-iron is better.

The interior may be cylindrical, but is better, as shown in the figures, narrowed toward the top and bottom. The grate bars rest on an iron ring (Fig. 3), supported by an offset in the masonry. The latter is mostly of a very rough kind, as the furnace is sunk in the ground to within a foot of the top, which, besidee affording great convenience in working, obviates the necessity of iron hands or stay-rods to support it against the expansion caueed by the heat. The greater part of the lining, four-inches thick, is of good clay, very slightly moistened, and heaten round a hollow wooden core, for which part of a barrel of suitable size answers very well. It is topped with a course of common brick, and above these is a flat iron ring (Fig. 4), with lugs, which may be bolted down, or simply let in flush with the top of the furnace.

The grate bars are not built in, but are free to be removed whenever desired. The furnace is constructed, when convenient, at the base of the main smoke-stack, with which it is connected by a flue; otherwise a large stove-pipe will answer for a chimney.

When the weight of melted metal does not exceed 100 pounds avoirdupois, the pot is lifted out of the furnace by hand, by means of the basket tongs, the mould being placed on the platform of masonry which is seen in the figure on one side of, and level with the furnace. The melter stands on the top of the furnace to lift, then steps to the ground one foot lower, to pour.

If larger quantities of metal are melted at once, a lever may be employed for lifting the pot. The lever is arranged like that of a blacksmith's bellows, being supported by a rope, chain, or swivel, in such a manner as to admit of a lateral as well as a vertical movement, and at a hight of not less than six feet above the furnace, the center of which is directly under the shorter arm.

From the longer arm of the lever a rope depends; from the shorter arm a link of half-inch iron, long enough to reach, when drawn downward, into the cavity of the furnace, and terminating in a hook engaging in an eye-bolt, which forms the pivot connecting the jaws of the tongs.

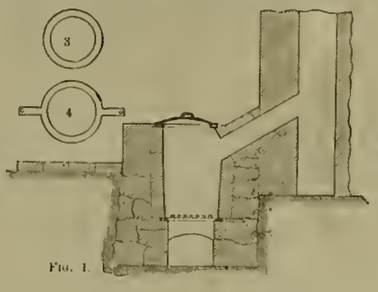

Fig. 1.

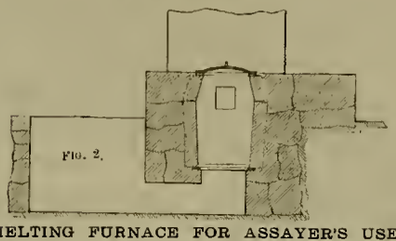

Fig. 2.

MELTING FURNACE FOR ASSAYER'S USE.

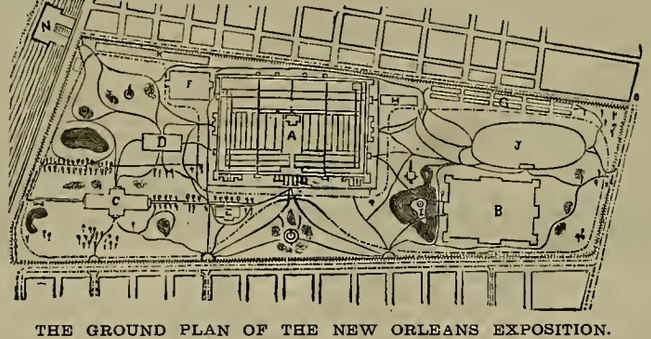
The tongs being adjusted on the pot, a ring is slipped over the handles to hold them together; the melter steadies them, while an assistant, pulling on the rope at the other end of the lever, lifts the pot out of the furnace, and swings it near to the mold, when the melter pours the metal.

The hands and arms of the melter are protected by gloves, which, in some works, are elaborately made of canvas and padding. To make a glove, I simply take an ore sack, double it lengthwise, and sew it so as to form a narrow bag, of two thicknesses of canvas, into which the arm may be thrust to the shoulder. The gloves may be wetted to prevent burning, but hot articles must not be grasped with a wet glove, because the steam produced will scald the hand; yet moisture is a good protection against radiant heat, while grasping the cool handles of the tongs.

In melting with charcoal, the best result is obtained, not by keeping the furnace full, but by letting nearly all the fuel burn away before refilling. A little practice will enable the melter so to manage that there shall be but little coal in the furnace when the time for pouring arrives, so that it is not in the way when seizing the pot with the basket tongs. The lifting must be performed without delay, otherwise the tongs may become red hot, and bend. The feet and legs of the melter may be protected by woolen armor, or by wetting the boots and trowsers; but melters and assayers must not shrink from a little scorching.

If there is much fuel left in the furnace when the melting is ended, the grate is taken out, and the embers fall into the ash pit, where they are extinguished.

Clinkers, if formed on the sides of the furnace, from the melting of the lining, or from dirty fuel, are punched off, while red hot, by means of an iron bar with a chisel end. If they were to be removed after cooling, the walls would be broken.



THE GROUND PLAN OF THE NEW ORLEANS EXPOSITION.

If a making a bar of clean skimmed metal, it is proper to throw a little resin, or powdered charcoal, into the pot, a few seconds before pouring. It prevents the sputtering which is often caused by the formation of base oxides. As soon as such a bar is cast, the top of it is covered with charcoal powder, to prevent oxidation while solidifying. When the slag or matte is poured with the metal the charcoal is not required.

MEXICAN NATIONAL HEADQUARTERS.

In a first-class office, the top of the furnace consists of a heavy plate of cast iron, sloping upward toward the flue, and provided with sliding covers. A melting furnace should have a strong draft, controlled by a damper in the chimney. The flue connecting the furnace with the stack or chimney should be 10 inches or more in width and about 6 inches high, in order to admit of placing a 6-inch cupel within it for a purpose which will appear hereafter. The floor, to a width of 4 feet on the front and sides of the furnace or set of furnaces, should be paved with bricks. A furnace, of which the interior is 16 inches square, is large enough for the melting of 2,000 ounces of silver at once.

California Day at the Exposition.

Only two months remain during which the people can see the grand World's Exposition of the progress and development of the vast resources of our country, the marvelously complete exhibit of Mexico, together with the endless collections from all parts of the globe. This Exposition, perhaps the last of a national character to be held in our country for years, is one of peculiar interest to all Americans. It is now all complete, and as it will probably close on May 31st, those who have intended going must postpone the visit no longer. During April and May the weather is generally very pleasant at New Orleans, the city being then at its best. The management state that the reports that have been circulated as to the expense of living at New Orleans, are greatly exaggerated. There are ample accommodations to be had at reasonable prices.

The management of the Exposition has recently issued notices that Thursday, May 7th, will be set apart as "California Day." The day has been designated by official action for the reception of the representatives of the Government, of the people of this State. Interesting ceremonies will take place, and an enjoyable occasion insured.

There are many Californians now in New Orleans in charge of the various exhibits from the State, and many visitors from here as well. No doubt, on the date mentioned, many others from different parts of the East will endeavor to be present. It is thought that many more people will go from here than have before visited the Exposition. Inquiring at the railroad office here it is found that excursion tickets from San Francisco to New Orleans and return may be purchased for $140. Tickets purchased at this rate are good, going within 30 days from date of sale. On the return trip the holder must be in San Francisco by June 10, 1885. Stop-over privileges are given within these limits. Recent advertisements by the Director General of the Exposition states that on this special State day, "California Day," the railroads of the country have agreed to make the lowest rates ever heretofore given. But, as stated, the roads on this coast keep the excursion rates above given.

People who intend to go from this coast should form their parties and make their arrangements immediately, and not very much time remains. The Exposition is described by those who have visited it as highly interesting in every way. The exhibits by the Government are far more complete and varied than they were at the Centennial.

California has already now many very complimentary prizes in the list of awards. The exhibits of agricultural and mineral products from this State have attracted great attention from all the visitors, the fruit display being particularly commended. The State collection of minerals, in charge of State Mineralogist Hanks, though late in arriving at the Exposition, is exciting a good deal of interest. Altogether, California is one of the States which has taken a prominent position at the Exposition, and her people should be glad of the opportunity to make the trip and see for themselves the products of other regions, where they can be compared with our own.

A short time since we published engravings showing some of the principal buildings of the Exposition. We give herewith an engraving showing the much-praised Mexican National Headquarters, and a general ground view of the Exposition. This plan is on a scale of 1,400 feet to the inch. A is the Main Building; h, United States and State Exhibits; c, Horticultural Hall; d, Mexican Buildings; e, Art Gallery; f, Factories and Mills; g, Live Stock Stables, etc.; h, Restaurants and Refreshment; i, Grand Fountain, 80 feet high; j, Live Stock Arena; k, Sawmills and Woodworking M'ch; l, Wharf, Mississippi River.

The grounds embrace the space of 247 acres, bounded on she north side by St. Charles avenue, on the south by the Mississippi river. The buildings front east toward the main portions of the city. An electric railway encircles the grounds.

The Mexican building is a structure of striking beauty, erected by the Mexican Government, and fashioned after the style of a Mexican Senor's residence. It is a quadrangle, with a frontage of 100 feet and a depth of 300 feet. Round its open interior or courtyard, runs a terraced gallery, supporting a collection of the rarest plants and flowers, and the most gorgeous birds of that famous land, seeming like a hanging garden. Surmounted at each corner and in the center of its front with light and graceful turrets, and painted in Oriental combinations of gold and green, with mediums of maroon and touches here and there of intense red, its Moresque style will attract and please the vision and give a fair idea of the taste and characteristics of the Mexican people, and fairly prepare the visitors for their wonderful exhibit. While intended simply as the headquarters of the Mexican contingent, it contains in two apartments, 64x32 feet, most attractive bazaars of Mexican art-work and bric-a-brac, feathers, wax, pottery and all the minute artistic creations for which that country is so justly famous.

Note on a Fire-Bulkhead for Mines.

The following paper was read hy Charles M. Rolker, of New York, before the American Institute of Mining Engineers:

It is now three years ago that I wrote a paper on the fire which broke out in October, 1880, at the Chrysolite mine, Leadville, Colorado, of which I was at that time manager. The paper was read by title at the Harrisburg meeting in 1881, and was accompanied by plans aud sections fully illustrating it. It was written to invite a general discussion of the course pursued in the management of that fire, since the various fragmentary and sometimes prejudiced or inaccurate newspaper accounts were not suitable to base judgment on. The paper I offered gave the facts as they appeared in the contemporaneous record which I had kept. At that time a difference of opinion had arisen with an adjoining mine, as to possible damages entailed through the fire; and a law suit was talked of. In view of these circumstances, the president of the Chrysolite company advised a temporary withdrawal of my paper. Somewbat later I withdrew it entirely, because of the unlooked-for delay in arranging the controversy referred to. It has now, indeed, been amicably settled; but the lapse of time has deprived the matter of much of its immediate professional interest.

To the urgent request of some of the members tbat I should, at least, give a description of the fire-and-gas-proof bulkbeads employed, I yield with some hesitation, since I lay no claim whatsoever to originality in these devices, and therefore question tbe value of such a paper.

The fire originated hy accident, in the Chrysolite, a mine comprising extensive and more or less irregular workings, containing immense quantities of timbering, but partially packed with waste rock or earth. Tbis class of mines is numerously reprssented at Leadville, Colorado, at many points in Utab, at Eureka and Virginia City in Nevada, etc. Moreover, the Chrysolite is connected by underground workings, for more than a thousand feet east of the seat of the fire, with adjoining properties, which have numerous shafts. The neighboring miues are situated on higher ground, the bill rising in an easterly direction; but they are worked to practically the same underground level.

The ore-deposits of Fryer Hill occur as shallow aud more or less flat deposits. The deepest ore-occurrence in tbe Chrysolite was, at the time, 150 feet below the collar of tbe main hoisting shaft, and it varied from that to 66 feet from the surface, where the only covering to the ore consisted of *detritus* and grass-roots.

Tbe ore-occurrence in tbe adjoining mines was very similar, baring local synclinals and anti-synclinals. The felsite, wbere it overlies the ore, is finely fissured. In the Chrysolite ore had been repeatedly mined up to the *detritus*, and it bad heen allowed to cave in, thus establisbing more or less connection between tbe surface and the underground workings.

Considering the rise of tbe hill to the east, and tbe fact tbat the fire started near the extreme west workings at tbe foot of Fryer hill, it is apparent that an immediate joint action on the part of all the connected mines, was not alone desirable, but imperative, in order to control the draft.

Unfortunately we were uot able to agree upon harmonious action. As a consequence, the fire was eventually drawn over a stretch of 400 feet of stoped-out ground, in places 30 to 35 feet high, and averaging, probably, 15 to 18 fest in higbt, by 35 to 40 feet in width. "Ths

System of Timbering.

In tbis mine is the square-set, Comstock style, varying, however, from tbat of tbe Comstock in having no diagonal members. Instead of these, the open square sets are filled with "cribbing," tbe sticks being 8 by 8-inch timbers; and according to the pressure and the importance of keeping tbe ground open, we employ solid cribs (each a solid mass of timbers) and open cribs (those in which space is left to fill in any waste that may be encountered). The stopes through which the fire swept had some open sets, partly cribhed and filled solidly with waste; others, solidly crihhed; otbers, partly cribbed and hut partially filled; and again, otbers, neitber cribed nor filled. The waste-filling of these timbered stopes was not a systematic one in any direction, but was the result of tbe local waste which was encountered in mining the ore. This made the approach to the fire, which, within the first few hours, communicated the flame to these cribs, extremely difficult, and even impossihle, without a proper regulation of draft. When it hecame apparent that harmonious action would not prevail, the necessity arose for the Chrysolite to isolate the hest ore-bearing portions of the mine from the fire and from the adjoining mines, in such a way as to permit our extracting the ore; moreover, this had to be done promptly, since those parts of the mine were in imminent danger. I then, of course, abandoned the plan previously tried, of putting up temporary air-stoppings, such as wooden doors (the cracks calked with cotton-waste soaked in tallow), plain earth-dams, etc. Readily constructed, permanent dams had to be built under sorely trying circumstances. Earth-dams packed wet, and up to ten feet thick, would let the carbonic acid gas through almost as though they did not exist. The stop-doors, calked hy an old sailor, looked as if they were on fire, so rapidly did the smoke and gas work through the calked cracks. In places, on account of the carbonic acid gas and smoke which were drawn through hy the eastern openiugs, men could work but five minutes at a time behind these temporary harricades, tbough they were supplied with fresh air by a No. 4½ Baker blower.

Dr. A. Serlo (*Bergbaukunde*, 3d edition, page 328) quotes from the *Berggeist*, and advises the covering of stoppings, on the side facing old works which generate gas, with a coating of asphaltum, to prevent the oozing through of gas.

The Stoppings

I adopted, were placed in gangways, drifts and winzes leading to stopes, either on fire, or in imminent danger of fire, but inaccessible, owing to ths manner in which they had been filled and timbered. These stoppings consisted, first, of a temporary stop-door, introduced to weaken the current of smoke and gas. This was simply made of inch-boards, cut to proper lengths and nailed to the posts and caps of a drift-set, selected as near to the fire as circumstances would permit. The cracks were calked with cotton-waste soaked in tar. Behind this door, earth or clay was filled in solidly for say 4 feet, more or less, the drift-timbers being left in. It is well to moisten the earth or clay and beat it down. A plain board wall was nailed hack of this tamped mass against another set of timbers to keep it in place. Tbis formed the complete temporary stopping, which, aided hy a bountiful supply of fresh air, was generally found a sufficient protection to permit the erection of the permanent stopping and bulkhead behind it. The latter was intended to prevent the spread of the fire itself, as well as the dissemination of gas and smoke throughout the remainder of tbe workings. To show the necessity of something more thorough and permanent, I may mention that a tamped earth-stopping, 10 feet long proved insufficient, even at the distance of a thousand feet from the seat of the firs to exclude tbe gas from a neighboring mine.

To Effect a Safe, Permanent Stopping.

Remove all drift timbers for a distance of from 25 to 50 feet. This is done quickly by cutting the posts nearly in two with an axe, cutting out or loosening the blocks and wedges, as far as tbis can be dofie, boring in tbe ends of tbe posts and caps auger-holes of the requisite number and size (according to the size of the timbers and tbe pressure upon tbem), to admit cartridges of giant powder, to blast tbe timbers out. As many of the cartridges are fired simultaneously as the nature of the ground will allow. Mud-sills and all fragments of timbers are removed, and the now untimbered drift is filled in with waste or earth, the finer the better. It is well to wet tbe ground frequently in order to pack the fine waste and to keep the drifts cool. Wbenever a sufficient length of drift has thus been freed from its timbers and has been filled in with waste to insure tbe safety of the adjoining works, the final gas-bulkhead is put in. The length of the eartb-dam is, of course, a matter of judguent, depending on the size and proximity of tbe stopes, as well before as behind the dam, and tbe comhustible material in them; in other words, on the supposed intensity of tbe coming fire and tbe consequent likelihood of its spreading. Preparatory to

Putting in the Gas-Bulkhead,

Ths place in the drift where it is to be erected is trimmed down to a section as nearly rectangular as possible. If the time permits, it is best to cut into the sides of the drift, say, from 4 to 6 inches, so as to get a shoulder. In the bottom a similar channel is cut, wbich connects with the sides. Should a place be chosen as a site for the hulkhead where a drift set has been standing, part of the bottom-cutting and often some side-cutting can be utilized. In case no side-cutting is resorted to, tbe old mud-sill can be utilized, as a bottom-piece, after lagging its sboulders. The extended mud-sill or bottom-excavation is then partly filled with tar and the foundation or bottom piece of timber is laid in it. Proper care must, of course, be exercised to lay the hottom-piece level, and to insure this, whatever piece of timber is used for it, its top and bottom should he dressed. On this bottom-piece a wall is built up, with such timbers as are at hand, dressed on two sides. I found 4 by 6 inches or 6 by 6 inches, of sawed sticks, a very convenient size. As the binding material for the wall, tar is used; aud to give additional stability, each stick is spiked to the lower one. The top-pieces are simply hammered in, but they have similar tar coatings; and the last one may require dressing and fitting underground. Holes, due to irregularities of walls or roof, can be filled in with clay or cement, if it is at hand. When the wall is completed, the entire face, clay and all, is covered with a thick coat of tar.

Instead of these wooden bulkheads,

Brick or Stone Walls.

May, of course, be huilt, and any little openings at the top or ends may he filled in with oement. But often, this material may not he on hand in sufficient quantities; or it may be much more expensive than the wooden bulkhead. Again, it will require longer time underground, to build a stone or brick wall, than such a wooden wall; and the wooden wall has the further advantage that nearly all pieces can be out and prepared above gronnd, with plenty of elbow-room and with as much dispatch as desired. Any good miner can prepare for, and huild such a wall, while he may uot he ahle to lay a good brick or stone wall. The blacksmith shop can turn out tbe desired spikes.

I used eight of the bulkheads, with earth-dams from 25 to 50 feet long, free of timbers, and a temporary stopping in front of these; and in no case did any gas work tbrough, or the fire spread beyond the temporary stopping. We mined for months behind tbs hulkheads, completely cut off from all connecting adjoining mines and from the fire, wbile neighbors, who resorted to otber means, could not enter their mine on account of gas.

I may finally remark, that this fire was not put out in the beginning, hose in hand (with an upcast away from tbe attacking force and a downcast supplying the fresh air) because the fire originated, as indicated, in the west workings at the foot of Fryer Hill, wbile the connecting shafts stood east of it and on higher ground; these were eithsr not kept continuously sealed or were insufficiently sealed, so that they drew the smoke and gas east into the face of any attacking party. A southern shaft, on which a stack was built, was used as an upcast for a limited period. The mine was not flooded because the district did not supply water enough to flood.

Carbonic acid gas was not used to extinguish tbe flames, because the Chrysolite itself could not be hermetically sealed, owing to the surface caves mentioned above, which had caused numsrous cracks extending from the underground work to the surface. Again, the rock itselt had numerous cracks and fissures in it, which the deposit being a shallow one, would admit air and leak gas. Finally, the use of carbonic acid would have involved tbe filling with gas of all the connected adjoining mines.

Steam was Injected

In the hope of checking tbe flames, but, where used for this purpose, proved of little use except to cool tbe ground. In the immediate neighborhood where the steam bad been discharged, we afterwards found the lower part of the timbers not burnt, but the fire had burnt the top part aud crept and spread along the roof.

The mine-sbafts were closed up as tigbt as possible, by putting in scaffolding (for some, as much as 16 feet down the sbafts) and packing dampened eartb on top to stop air-currents and to confine to the mine, as much as possible, tbe carbonic acid gas generated by the fire. The two last principles, combined and practiced, not alone by us, made the fire die out of itself, but not until seven months after we wers working and extracting ore from our isolated portion of the mine.

Our experience showed that the heat retained in a smoldering stope, long after it had ceased to give signs of active combustion, was sufficient to cause a rekindling of the firs as soon as fresh air was admitted. Even when, after tbe elapse of months, we cautiously penetrated into the burnt district, the heat of the ground was almost insupportable.

The Business Outlook.

During tbe past year tbe country and the entire husiness world, in fact, has beeu passing tbrough a period of most unusual depression. Tbe fact does not need the added emphasis of comparative figures, whicb have been given time and again during the last few months.

What we have now to note is the unmistakable signs of returning prosperity. There is already a well defined rift in tbe clouds of adversity, which is gradually growing wider and brighter; or as an exchange bas expressed it, "the wave of hard times has spent its force and its waters have begun to recede. Tbese periods of depression are like the tides of tbs ocean, the ebb follows the flow. It is well that tbis is so, for otherwiss there would be no check put upon husiness and the undue inflation of prices," and, as might also be added, of excessive over-production.

What we have now to encounter and adjust is the very general discontent of tbe working classes hecause of the necessary re-adjustment of wages, as the inevitable consequence of the diminished profits of capital and the sharp competition set up between different localities and diverse nationalities. To this we must also add the proverbial impatience of American business men, because the benefits of returning prosperity are not immediately and more fully felt. It would be well, and better for all, if we could wait awhile with patience for tbe new turn of affairs to give animating force and a new vitality to business.

A cotemporary of this city has hcen interviewing a number of our business men in regard to the cause of the depression and the present outlook for the near future. Nearly all the persons interviewed lay great stress upon the importance of encouraging a large immigration of desirable families, who can come with means, and strength and will to build up homes among our numerous agricultural valleys, and to occupy the vast unimproved tracts which have been long held for speculative purposes, but which are now heing divided up into small holdings at more reasonable prices than have hitherto obtained. We need this class of emigrants to consume, at home, our surplus cereals and manufactures, and to fill the void in the market for California products which has been made by the opening up of Oregon and Southern California to a direct trade with the East through the Northern and Southern Pacific Railroads, which have recently been opened for such traffic, to the disadvantage of this city.

New and Remarkable Gold Deposit.

Tbrough tbe courtesy of Mr. John Musson, of Sydney, New South Wales, the *Engineering and Mining Journal* has received tbe report of Mr. R. L. Jack, of the Queensland Geological Survey, on the Mount Morgan Gold Deposit.

Mount Morgan is only twsnty-two miles from Rockhampton, on the Fitzroy River, and not more than half that distance from the Central Railroad. It is an isolated cone, rising from tbe plain through which runs the river Dee, the plain being flanked east and west by bluffs of Mesozoic sandstone, out of which the valley has evidently been carved down to the level of tbe primitivo stratified rocks that now form its floor. These old shales and quartzites are riven by dikes of rhiolite; and tbrough them have evidently come to the surface geyscr springs, the deposit from which has formed the cone of Mount Morgan. The water has, besides gold, carried in solution silica, iron, alumina, etc. But tbs gold seems to have been precipitated chiefly in the cup of the geyser, and to be richest in a large mass of iron ore, which, in the form of an inverted cone, forms the vertical axis of the mountain, and in the nodules of iron ors that occur in certain soft cellular siliceous layers. These alternate witb more or less ferruginous layers, all of which radiate, like the leaves of a fan, from the base of the cone, and enclose the iron ore. Gold occurs in all the layers except in a siliceous earth, and therefore its association with iron is certainly not accidental.

Mining is conducted by quarrying down ths apex of the cone, and from an open cut 100 feet below the summit. Tbe yield of the rock is almost fabulous. Working returns are not given; but fair samples selected by Mr. Jack gave from a quarter of an ounce to 10 ounces per ton, and others sent to the Sydney Mint to be experimented on gave 85 ounces per ton. Some of the rock in these samples was selected.

Prolonged amalgamation extracts only about half the gold; but during the few months the mine was worked, prior to the puhlication of the memoir, tbe Sydney Mint had received 10,000 ounces. It differed from any other gold known to commerce in tbat it was unalloyed with silver, assaying 99.7 psr cent of pure gold, the 0.3 per cent being copper and iron.

Copper.

The question of production or prices is now confincd to the Lake, the Arizona and the Montana mines. Prices have reached sucb a point that, unless some new and unexpected developments are made, the otbsr districts are practically of no account. At the present rate of prices it is said tbat only four or five of ths Lake mines mors than cover expenses. The larger Lake mines have splendid plants, cheap fuel, low wages and while working very cheaply produce an exceptionally fine quality of copper. The large Arizona mincs are said to be working at a profit now, and, quality considered, can lay down their product at the seaboard at very close to if not full as good figures as tbe Lake. The Montana mines are mainly well managed and with good plants. Some of them, working the richer argentiferous ores, gain two or three cents per pound by the silver recovered. All these mines bave a high grade, but impure ore. The wages are high and there is considerabls room for reduction in this respect. Both the Arizona and Montana mines are now well connected with the railroad system of the country, and have all tbe advantages accruing from tbis at present, though there is room for lower freight rates.

Should ths present low rates of copper prevail throughout the year and a number of ths smaller mines he compelled to close in consequence, it is probahls the production of 1885 will equal and probably exceed somewhat ths production of 1884. This will be accomplisbed hy the increased output from large mines with the view of thereby increasing the profits. The Calumet & Hecla has expressed its intention in so doiug. Some of the other Lake mines will probably adopt the same policy. As to the Arizona mines, the question of an increased output depends merely upon whetber the owners consider it wise to exbaust the mines at present low profits.

The United States has, within the past four years, grown from the position of a subordinate copper market to that of the controlling market of the world, and the prices of this metal in the markets of the world are now regulated by the production of this country.

THE directors of the famous Quehrada copper company state that tbey have contracted with a smelting company for the sale of 30,000 tons per aunum, for five years, of their ore, on the basis of Chile bars. The price is undcrstood to be equal to 8s. 9d. per unit, with bars £47 10s. per ton. The average of their sales for 1884 was 9s. 9d. per unit, and a considerable stock was carried over to this year. The total production was 4,000 tons fine. In 1883 the average price was nearly 11s. per unit, which left a loss of £3,963.

THE Southern Pacific Railroad has sent to the New Orleans Exposition nearly 10,000 littls slahs of polished redwood, to he given to all who are interested in California's products.

ENGINEERING NOTES.

The Canadian Pacific.

"One hundred million dollars' worth of land and as much more in money subsidies is about what tho Canadian railway has cost Canada up to the present time," said a well-known exmember of the Canadian Pacific railway syndicate a short time since. "And this," he continued, "is only a drop in the bucket to what that great railway project will cost the country hereafter." The gentlemen who compose this syndicate it is generally conceded will not undertake to run the road after it has been completed. They will hand it bodily over to the Canadian Government, and that institution, which has acted so benevolently toward the Canadian Pacific railway syndicate, will run the railway and make up deficiencies, which must necessarily be involved in the operation of such a road out of the public treasury. That the portion of the road from Winnipeg to the Pacific Coast must for many years to come be run at an immense loss of money, few, if any, who are well informed on the matter will attempt to dispute. Much of the country through which the railway runs west from Winnipeg, as well as between Port Arthur (Thunder bay) and Rat Portage, is totally unfit for any kind of agriculture. Therefore it must be admitted that the great bulk of the Eastern traffic must come from the Pacific Coast. The trade from the Orient to British Columbia is very small, and with great competition of steamship lines to San Francisco and other American ports it must remain very limited for years to come, so that the railway may look for very little support in that direction. The trade from British Columbia itself to Eastern Canada and Europe is very light, being confined principally to the products of the salmon fisheries, which would not of itself keep an ordinary tramway running.

Owing to the greater portion of the farming country in the Northwest being situated between the American boundary line and the line of the Canadian Pacific, at a very considerable distance from the Canadian railway, the cereals it might otherwise carry to the East are out of its reach. It might construct a branch line into this farming territory, but it objects to carrying any portion of a railway too near the American boundary, fearing that if its main line is tapped by American western roads what little traffic it may command will be taken away from it by them. It was for this reason, it will be remembered, that the Manitoba Southwestern railway was disallowed by the Government. The difficulty is keeping the road open in the severe winters experienced in the Canadian northwest, and especially that portion of the railway which runs along the north shore of Lake Superior, which is for hundreds of miles over a barren, exposed waste of land, which, along the coast of the lake shore the railway is intended to run, has during the past winters been rendered almost impassable by the accumulation of snow and ice.

Reclamation of Florida Swamp Lands.

The reclamation of Florida Swamp lands is being pushed vigorously forward under the Disston Company. The Territory in which the company proposes to operate is 225 miles long with an average width of 75 miles. Canals are being cut to drain the lakes and swamps. The first canal was cut 18 months ago, and is 60 feet wide, 10 feet deep and 4 miles long. The effect of this drainage was to reduce the level of Lake Okeechobee, having a surface of 50 square miles, to the extent of 7 feet. From this lake several canals will be cut southward and eastward to the ocean. These canals will be from 15 to 20 miles in length, and will afford good waterways to the interior. The company has in use four dredgers and two steamers. It has also established a sugar plantation at a point, which two years ago was perminently under water. The growth of the cane thus far surpasses all expectations.

The locality of the lake named is in the northerly portion of what is known as the "Florida Everglades," which comprise almost the entire southern peninsular of that State for 150 to 200 miles north of Cape Sable. The northern shores of Lake Okeechobee was the scene of the terrible wars which were waged with the Seminole Indians, the remnants of whom, to the number of about 40 families, still reside there maintaining their original habits of living by hunting and fishing in a tribal relation governed by a lineal descendent of one of their ancient chieftains.

The Panama Canal.

EDITORS PRESS:—Will you please inform us if the design is to place locks in the Panama Canal, or if it is to be a tide-water canal as presumed in the article enclosed to you, and oblige,

yours truly, F. L. CUSHING.

Silver Reef, Utah, Feb. 24, 1885.

We believe the only lock in the Panama canal is to be a "tide-lock canal" at the western terminus, on the Pacific Ocean, so as to maintain at all times a sufficient depth of water for ships to go in and out. This has been found necessary, owing to the high rise and fall of the tides.

BOSTON is to have an elevated railroad.

The Tanning Industry.

Mention has often been made that with all the patent appliances for quick transformation of hides into leather, none exceed or even equal the old-fashioned way and hand-labor. Some writers and investigators claim that the most of the rapid methods now in use are positively injurious to the products, and that large quantities of inferior leather are found in the market as a consequence. As to the truth or falsity of these claims we are not in a position to venture an opinion. Our present intention is to make a brief reference to some asserted improvements, which have been quite recently introduced into the art of tanning.

A New Tanning Process.

A patent has recently been granted for a very simple process of tanning, which is thus described: For every 100 lbs. of skins dissolve 4 lbs. bichromate of potash in about 6 or 8 times its quantity of boiling water; then add 2 lbs. muriatic acid. Stir well and let stand about half an hour; then add this liquid to the vat containing water sufficient to cover the skins suspended in it and kept sufficiently apart to allow the liquor ample room to penetrate the skin uniformly, and leave the skins in this liquor until penetration of the chrome is complete, which is discernible by cutting off a small part and noting in the section the depth of the penetration. The advantages claimed are: its adaption to any sort of skin or hide, or even furs or chamois. The leather made by this process is said to be more tough and denser than that produced by the old style of tanning by tan bark, sumac or gambier. Prepared by the process the leather can be boiled without injury.

Another New Process.

One John Shaw, of Hindmarch, near Adelaide, South Australia, has invented a new method for tanning with soap and oil, together with carbolic acid. The skins which have been limed in the ordinary manner, also haired and prepared, if for the production of sole leather, are placed into a tan bath consisting of a mixture of ten gallons water, in which two cwt. soap are dissolved, and contain one gallon carbolic acid, in which the skins are left until they have become converted into leather. This process can be materially accelerated by adding a pint of fresh carbolic acid to the tanning fluid from time to time. For the purpose of producing another softer leather the raw, limed and haired skins are for one or two days placed into a mixture of four parts earhon bisulphide, and one part carholic acid, after which they are washed.

A New Tanning Material.

One of the novelties of commerce is a new agent in tanning, the tannekaya bark, which comes from New Zealand and is of recent discovery. Last year 375 tons were exported, the greater part of which went to Grenoble, France, where it was used in dressing leather for gloves. The bark costs $40 per ton in its native country, and the freight is as much more. It contains 28.66 per cent of tannin, whereas oak bark contains only 8.85, and hemlock 9.5. The tannekaya tree is very beautiful, and, as its timber is very useful, it has every point of value. It belongs to the fir species, and, it is thought, would thrive well in some portions of the United States.

The Safety Pin—Its Antiquity.

Taking the common "safety pin" as a starting point, the various types into which the variants fall are classified and exemplified very thoroughly in this little study. Not a single part of the simple, though not primitive, instrument, but have suffered some strange metamorphosis. Now the catch is fastened into a disk or diamond-shaped plate, now lengthened into a tube, now knobbed and put back to the bow; the bow is alternately shortened, lengthened, squared, rounded, decked with studs, grain work, braces, rings, plates, amber beads, figures of birds and beasts and men, or tricked with hanging ornaments; while the spring is found doubled, multiplied into coils, changed into a solid roll, or bulge, or magnified into gigantic proportions in relation to the other parts of the brooch. The Italian groups, with either simple or two-stringed bow, are very distinct; the Hungaro-Scandinavian examples are marked by their spiral catch and coil spring; the Greeks characteristically seized on the spring as the fibula, and curled the wire into two spirals, from the center of which catch and pin spring. The history of the fibula can be traced for some 3,000 years, starting from its first appearance about ten centuries before Christ.—*The Academy.*

AN IMMENSE ARTIFICIAL FOREST.—The largest artificial tree plantation in the world is located in Scotland. It is known as the Seafield Tree Plantation, and is used both as a hunting park, and for the growth of timber for profit. The Seafield estate comprises 160,000 acres in Inverness-shire, 50,000 acres in Banffshire, and 97,000 acres in Morayshire, the rental amounting to about £75,000 a year. Castle Grant, in Strathspey, is the old seat of the family, and around it are some of the best grouse moors in the Highlands. The encumbrances on the Seafield estate amount to nearly £800,000, but the Strathspey woods will, in the course of a few years, enormously increase the income. It was estimated recently that in 30 years they will realize £50,000 a year, not merely for one year, but regularly year after year. There are a hundred square miles under timber in the district, on the estates of Lady Seafield and the Duke of Richmond, principally the former. The grandfather of the late Earl commenced planting about 1820, and since 1855 the work has been done in a thoroughly systematic manner. In two plantings near Carr Bridge there are 35,000,000 trees on 25,000 acres. The trees are principally larches, spruce and firs; but 105 varieties are grown on the estates, and there are large nurseries near Abernethy. Over 200 persons are employed in the forests, which are well worth a visit from any one interested in the subject.

Leather from Sinews.

An artificial leather, which is mixed with five to ten per cent of sinew and pressed into sheets like ordinary leather card board, has been recently made in Germany. Both materials are made separately. The leather pieces are washed, cut, boiled in alkaline lye, torn, neutralized with hydrochloric acid, and finally carefully washed once more to remove all traces of acid. The sinews are treated similarly, but steamed in an acid bath until they are like glue. When they are thus prepared the materials are mixed, pressed into sheets, moistened on both sides with a concentrated solution of alum, and the upper surface is at last given a thin coat of caoutchouc in solution with carbonic bisulphide.

BICYCLES.—The manufacture of bicycles and tricycles is conducted in England on a much larger scale than in this country, the capital invested amounting, it is stated, to $15,000,000, and employment in their manufacture is given to 8,000 persons. There are said to be 300,000 cyclists in that little isle—a number that, if formed into an army to march against the Mahdi, would constitute a formidable force, but, we imagine, would be of very little effectiveness in the Soudan.

DURING the quarter ending March 31, 1885, very nearly 300 new buildings have been undertaken in San Francisco at an estimated cost of over $2,000,000, over 45 per cent of which cost goes into permanent improvement of brick and stone. During the same period of 1884 the new buildings projected numbered only 198, at a cost of a little over $1,000,000. This certainly is a satisfactory showing.

SEA FOWL SMOOTHING THE TROUBLED OCEAN.—A Fiji writer remarks that when flocks of tern and other sea fowl rest upon the sea in great numbers the water becomes smooth, and there in "not a ripple to disturb them." This is ascribed to oil emitted by the birds.

CHILLED IRON is the most impenetrable of all metals. In warfare it is the only sure defense against heavy modern guns. A plate of chilled iron may be thin enough to be shattered, but no such plate has ever been penetrated.

GOOD HEALTH.

NECESSITY OF RELAXATION. — There is a homely saying among the fishermen that those who will not mend their nets will soon be unable to catch fish; and one is seldom found so improvident as to let a hole grow larger and larger until the net is useless. The nearest approach to absolute rest is sleep, and of this every man, woman and child should have abundance, proportioned to his constitution and occupation; but there is a relative rest, quite as important, and more neglected by most busy men and women; this rest is recreation.

The "I haven't time" excuse, although as popular as ever, is sadly threadbare. A man owning property can invest a thousand dollars though he withdrew from active business if he is sure that the money will double itself. We all have twenty-four hours in every day to invest, and if one hour withdrawn from business can be better invested, is it not a wise thing to do it? Relaxation, however, to be profitable, must be whole hearted. It is not rest for the business man to bring his affairs and worries home with him. It is not rest for the student to brood over theories and formulas when he walks, neither is it rest, to take one's fears and anxieties to our friends table. If we have no heart to throw off these burdens we should make the effort in spite of ourselves. We have been bound to our cares as the convict is to his ball and chain; it is time to master circumstances instead of being their slaves.

Mental slaves are more dependent upon the physical condition than we are inclined to think. Irritability means overstrained nerves; the "blues" and "black butterflies" are other means of indigestion and a poor circulation. Recreation, it is to be remembered, is neither dissipation, nor yet absence of activity. Complete change of thought is relaxation; and Hood is quoted by a recent writer as saying that the Quaker always enjoys life, for he makes a pleasure of his business and a business of his pleasure.—*Every Other Saturday.*

ASPHYXIA FROM COAL GAS.—"You may set it down," said an eminent medical practitioner, "that the stages in asphyxia from coal gas are confusions of ideas, delirium, muscular spasms, convulsion and paralysis, unconsciousness and finally failure of the heart's action. In other words, unconsciousness is one of the last stages, which leaves the natural inference that the victim is aware of approaching death until the very last beating of the heart. The suffering must be terrible, because the duration of the last struggle, in which the body is entirely passive and prostrated while the mind retains every impression more vividly than even in its normal state, is not less than thirty minutes and in some cases longer than an hour.

"This medical view of asphyxia from coal gas is substantiated not only by the truthful relations of persons who have been rescued while nature was about to succumb, but also by the condition of the body after death. The only irrational symptom disclosed by the scalpel of the operator is the presence of dark, venous blood in the right side of the heart and the venous system. The left chambers of the heart contain only a small quantity of dark colored blood, while the vessels of the membrane and sinuses of the brain are filled with it. This demonstrates plainly that the brain was the last organ to succumb."—*Chicago Herald.*

TURNS THE HAIR GREEN.—A Wallingford, Conn., correspondent of a Hartford paper writes that a peculiarity of a workman in German silver spoons is the color of his hair. Years of labor in the trimming or buffing room of a spoon factory dyes the hair of an operative pale green, which it takes years to change. Aside from the disagreeable and remarkable dye the manufacture is extremely dangerous. The principal part of the composition of German silver is copper. The fine emery wheel used in trimming and shaping the spoon fills the air with minute particles of this noxious poison that soon fill the lungs and cause a disease similar to consumption. To escape this a sponge is worn over the nostrils of the workman.

POISONED BY EATING WILD PARSNIPS.—Two boys at Floyd's ranch, Nevada, ate some wild parsnips a few days ago. Another boy tasted the poisonous root, but not liking it spit it out. Antidotes were given the two, but to no avail. They died almost instantly, with the same symptoms that strychnine causes. The wild parsnip is very common along the Nevada streams and cattle frequently die from eating it. This is the first time that any person has died from eating it for a number of years. It resembles the horseradish in taste and appearance.

AN ANXIETY THAT BREEDS ILL HEALTH.—The very anxiety for health which Sir James Paget and the sanitarians inculcate is an anxiety that breeds hypochondriacs, and tends, to that extent at any rate, to defeat its own object. Every one must admit that the highest form of health is unconscious health, just as the highest form of beauty is unconscious beauty, and the highest form of moral excellence is unconscious moral excellence. The typical healthy man is not aware of his health; he does not think about it at all.—*London Medical Times.*

DEATHS FROM HICCOUGHS.—A recent number of the Chattanooga *Times* says that there has been three deaths in that city already from a mysterious malady, the only specific symptom of which was hiccoughs. Physicians were disposed to regard this merely as a coincidence, but later developments make the matter more serious, and the subject is proving very puzzling to several of our leading physicians. There were two more cases which were in a very critical condition, and death seemed inevitable.

FAT AND ADIPOSE TISSUE.—Globules of fat occur in many mollusks and insects, but true adipose tissue is found only in back-boned animals, particularly the herbivorous. In the average man it constitutes about one-twentieth part of his weight. The fat of animals has the different names of oil, lard, tallow, suet and spermaceti. It is a reserve of nutriment in excess of consumption, serving also as a packing material and a preservation against cold.

CHLORIDE OF METHYL AS A REMEDY FOR NEURALGIC SCIATICA.—Chloride of methyl, sprayed, produces a degree of cold represented by 23 degrees C. or 94 degrees F. M. Debove has played a jet of this cheap fluid on the skin along the whole length of the limb corresponding to the course of the sciatic nerve and its main branches, effecting almost instantaneous relief to the sufferer from neuralgic sciatica.

SINGULAR CIRCUMSTANCE.—Mr. Gresham a grocer at New Albany, Ind., was stooping down measuring onions, and felt something give way at the knee. Supposing it to be his trousers he continued his work, but in a moment or two fell back upon the floor. It was discovered that the muscles of the knee cap had given way. The injury is a very serious one, and he will never have full use of the limb again.

BAD AIR AND INSANITY.—M. J. Harrington Douty, of the asylum for the insane at Worcester, England, declares that insufficient oxygen, or merely vitiated air breathed constantly, will produce melancholia.

A LINIMENT of equal parts of oil of winter-green and olive oil, or soap liniment, is said to afford almost instant relief from pain in acute rheumatism.

ABOUT 900,000 bananas per month are consumed in San Francisco.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

INDIAN DIGGINGS.—Amador *Ledger*, April 3: Hale and Baughman are doing good work. They are working a six-inch nozzle and there is enough gold visible on the bed-rock to satisfy them that they will clean up a small fortune. Oxby is in good pay, and will not get left. The Guadaloupe, owned and operated by Leventon is in rich gravel, showing a great deal of coarse gold. Ball and Jenkinson are still operating the Frances Cullings. This is a fat piece of property, and the boys feel justly proud of it. Jeff French has purchased the Big Bonanza claim from Kohler. Consideration $3,000. It will be worked by a six-inch nozzle and full force.

MISCELLANEOUS.—Work on the Ione Company's coal mine near Dosh's store is progressing favorably. All difficulties with water and quicksand have been overcome, and the coal deposit has been reached. The quality of the coal promises to be superior to any heretofore met with in the valley. Grading for the 20-stamp mill in Hunt's gulch is completed. S. D. Shugert went below this week to inspect the machinery, previous to its shipment.

VOLCANO.—The mine owned by the Petty boys, located at Fort Ann on Dry creek, about three miles from town, looks rather encouraging. The tunnel extends into the hill about 100 feet, and the ledge is three feet wide and contains free gold in great quantities. Work is now progressing day and night. A large quantity of rock is on the dump, which will be immediately crushed. Benjamin Ross, ex-Supervisor, owns a quartz mine near the slaughter house, about one mile from town. A tunnel has been run into the hill a distance of 150 feet. The ledge is three feet wide and shows free gold. The last crushing paid $30 per ton. About 12 tons are now on the dump. Work progresses both day and night.

Calaveras.

STRUCK GOOD GROUND.—Calaveras *Chronicle*: We are pleased to report that rich ground has been struck in the Anthony Bros.' gravel claim on the west side of Old Woman's gulch. The owners are highly deserving of success for their steady perseverance and we congratulate them on their find.

El Dorado.

MOUNT PLEASANT.—Cor. Placerville *Overseer*, April 7: The Mount Pleasant mine, formerly the property of Stukslager & Plumtree, south of here, has been purchased by Hub A. Wood and Wallace McKinney, and they have been at work cleaning out one of the old shafts, which was some 40 ft in depth, and are now working in the solid rock at a depth of 60 or 70 ft. The rock looks fine and prospects well. Some $80,000 to $100,000, and perhaps more, have been taken from this mine in former years. The present owners have gone to a good deal of expense in putting in a car and other fixtures. Hub Wood says he is confident that they can make a stake on the mine yet. It has been a pocket mine, and by no means easy to work, but when a pocket was struck it panned out rich.

Mariposa.

GOLD.—Mariposa *Herald*, April 4: The old Nat Harbet or Rollins mine, situated at the head of Sweetwater, which was relocated by Pete Gordon and others and sold to James Grove, a year or so ago, was sold recently to Messrs. Carter & Adams of San Francisco for $15,000. A gentleman by the name of Peck is superintendent of the mine, and we understand is working a force of 18 men.

Mono.

ANOTHER STRIKE AT SWEETWATER.—Bodie *Free Press*, April 4: Mr. Patterson, after whom Patterson district is named, made an important strike in Frying Pan gulch the other day. It is a very rich gold vein and was cross-cut by R. A. Cameron who had come to Patterson's assistance and advised him which direction to take. Cameron had previously struck it rich in an extension of the same lode.

THE STANDARD CON. RESUMES WORK.—Bodie *Free Press*, April 4: Almost immediately after the closing down of the mine and mill at the Standard Con. on the 31st ult., miners were selected and put to work again in the mine. President Pettibone's intentions are to increase the force in the mine from time to time as he finds it practicable, and to resume milling after some necessary repairs and the accumulation of ore are made, which will mill considerably higher than the low-grade proposition that does not much more than pay expenses of extracting and reduction. The plans as now contemplated will in due time set all the machinery in motion, employ the usual number of men and pay a regular profit, while the work of prospecting the property systematically may at any time open new and important developments. There is plenty of virgin ground to be explored and the various theories advanced respecting the existence of ore bodies equal to those worked in the past appear to be well founded.

BODIE CON.—At the mill 160 tons of ore were crushed during the past week. The bullion from this will be shipped with the product of next week's run. At the mine the men were employed in getting out ore. Thirty-nine men employed.

MONO.—The Mono south drift has been extended during the past week 15 feet; its total length being 137 feet. The winze has been sunk 8 feet; its total depth being 45 feet. Six men employed.

Nevada.

MOORE'S FLAT.—Cor. Nevada *Transcript*, April 4th: Although I am an outsider, I was living here long before the prospecting on the Metropolitan commenced by the present owners. Mr. Buck deserves much credit for its development, but George Abraham, formerly of Grass Valley, is the man to have the greatest praise. He commenced working on said Metropolitan ledge the 13th of April, 1875, and has now three tunnels in on the ledge, one under the other, with about 100 feet of backs between each. He has between 700 and 800 feet of tunnel driven and is still at it with great confidence of striking more free gold. He has good prospects in sulphuret rock, but not much free gold as yet. The sulphurets are very good and plentiful. I should think to look at it that the ore would go five per cent. The ledge is from 3½ to 7 feet thick with splendid walls. In fact it is the best defined ledge I have ever seen, and I have seen many. Abraham's present tunnel is from 400 to 600 feet under where Buck struck it, and he can still go down and bring in a tunnel 500 feet deeper and have plenty of dumping places. Abraham has splendid working facilities, with a good mill site at the base of the hill, and plenty of free water the year round running through his claim of 3,000 feet and within his bounds. Mr. Abraham gave Mr. Buck the privilege of running a crosscut tunnel to prospect the extension of said Metropolitan ledge above the Miners' Ditch. So Mr. Buck struck the ledge in Abraham's ground and it shows good prospects of free gold. He has all of sixty or seventy feet to drive to get into his own ground. A gentleman from Tehama county by the name of Nellis, came here last year to prospect for quartz. He was shown several ledges and started to work on one down near the Middle Yuba river. It runs in a southeasterly direction to the head of New York ravine. The name given the ledge by Mr. Nellis is the Eagle. There are eight claims taken up on the Eagle ledge. Mr. Nellis has good prospects. Messrs. Davis & Hathaway have very flattering prospects. They have the northwest extension. The southeast extension is owned by Johnson & Co.; the next by Professor Crosby; the next by George Abraham and Wm. Buck; the next by S. L. Blackwell; the next by Mr. Sullivan, and the next by Copperas & Dugan. There is another ledge near the Copperas & Dugan claim owned by two Nevada City miners named Hart & Bond. It shows good prospects of free gold. I think Moore's Flat and Snow Point will be great quartz mining camps before long.

GREEN MOUNTAIN MINE.—Grass Valley *Union*, April 3d: The lessees of the Green Mountain mine, on Osborn Hill, have completed their steam hoisting and pumping works, pumped out the mine, and are now taking out quartz for crushing. The old shaft is down 107 feet, and an incline 30 feet lower. The intention of the lessees is to precede with the sinking of the incline to open another level, while at the same time they will continue to take out ore from the level that is opened. The Green Mountain yielded very rich quartz some twelve years or more ago, but the Company got into costly litigation, and work was stopped. There are no legal difficulties to embarrass the work now.

MINES LOOK WELL.—Foothill *Tidings*, April 7: There is plenty of prospecting going on in this district. The Idaho mine has greatly improved during the past week. The water is all pumped out of the North Star mine, and in a very short time a full corps of miners will be put to work. Several shafts on the property worked by tributers disclose a good ledge of fine ore. Before very long the Empire mine will be run by water power. From the eminence of Ophir hill the water can be conveyed to all parts of what is known as the southern mining district of Grass Valley, and there are numerous gold bearing ledges that will pay for working, provided water power can be had. The Maryland mine has its pump running regularly and the company are sinking for their pay chute. The Imperial on Deer creek, is still working and there has been no particular developments since our last report. The Empire is running night and day and is taking out the very best kind of milling ore. There are but few, if any, mines in this State that are better gold providers than the Empire. Architects and draftsmen are now at work drawing plans for the addition of 30 stamps to the Empire mill. Then there will be 50 stamps in all and they will be kept busy night and day for many years, according to all appearances. The New York hill is looking well and gives great encouragement for the future. The Pennsylvania, joining the Empire on the west, is working with promised good results. As soon as water power is introduced into the Empire mine the Allison Ranch Franklin will start up (it should never have been closed down) for then they can run it by water power. All of the custom mills in and around Grass Valley are kept busy crushing ore for prospectors, but it is seldom that the yield ever gets into the newspapers, the owners of the ore saying that they would rather keep the yield private.

San Bernardino.

MESKAL.—Calico *Print*, April 3: W. A. McFarlane of Meskal, near Ivanpah, stopped at Calico a few days while on his way to San Bernardino. He reports the mines at Meskal belonging to him and S. A. Barrett, as looking well. They have 100 tons of $100 rock on the dump and 300 or 400 tons more in sight in the mine which has been considerably developed, 100 tons having been milled by a former management, but of a low grade. Mr. McFarlane intends to return to the mines with a small mill. They have a good prospect and feel confident their operations will be profitable.

Shasta.

THE WINTHROP MINE.—Redding *Independent*, April 4: The new reduction works, now being erected at Copper City for the Winthrop mine, are nearly completed, and, when finished, will be one of the finest and most complete mills on this coast. The works are being put up regardless of expense by an English Company, who have leased this valuable property for a term of years from the owners, Messrs. Spruance & Stanley of San Francisco. It is now calculated that they will be producing bullion by April 20. The owners and lessees are confident that they have now got hold of a process whereby they can profitably reduce the ores found in that section, and as we now see the process is about to have a fair test we cannot but feel assured that the permanent prosperity of those mines is soon to be fully assured. This will be a steadily increasing benefit to our county, and we are very glad to see it.

QUARTZ AND PLACERS.—Shasta county *Democrat*, April 1st: The placer miners of Buckeye are praying for more rain. They want more water to clean up with. Billy Litgen of Buckeye district last Saturday struck a pocket from which he took out $23.50 in three pans of dirt. We hear that the Pioneer company has struck good ore at a depth of 40 feet. They are now running night and day shifts. Instead of as was reported last week that George Klein of Deadwood had sold his mine for $16,000, he has bonded it for one year for that sum. Keifer & Tucker who are sinking on the Monitor near the Silver King last Saturday struck 30-ounce ore. This week the ore looks much better as depth is attained. We are told the new Copper City mill will be running by the first of next week. The gentleman who was sent from 'Frisco to superintend setting up the mill returned last Thursday. Bob Campbell is sinking a shaft on a gold quartz lead on the head of Oregon gulch for a half interest in the claim. It is owned by Lowrey & Brincard. The vein is not over 20 inches wide, but the ore is high grade. Work on the Bullychoop tollroad will commence with a large force of men next week. Mr. John Q. Finch is already on the ground, with headquarters at Watson's gulch, arranging the details of an active campaign against the rocky fastnesses of the towering mountain summits. The mill recently erected by Messrs. Patten & Day at Sunny Hill closed down last week after a short run. It was found after running the mill for a short time that, owing to the presence of antimonial and zinc sulphurets in the ore, the ordinary plan of catching the gold on plates would not answer, and a new method of working will have to be adopted. Martin Leach and Joseph Penrose, who own a promising claim about a mile and a half west of the Hall reservoir, are running a tunnel to tap the vein 80 feet deep. McDaniel & Co., who own a claim adjoining, have a shaft down about 30 feet, and are now running a tunnel to tap the vein about 70 feet. The owners of these two claims are getting encouraged with their prospects. Last week we took a trip over to Star Gulch to see what Dan O'Neal was doing on the Florida. We found him hard at work taking out some very rich rock. On the dump we failed to find a piece of rock that did not show more or less free gold. He has three men employed and is running a horse arastra which crushes from 250 to 275 pounds of ore a day, and with this crude way of milling ore he cleans up from $700 to $900 a month, which proves that the Florida is a pretty good property. At that rate a small stamp mill would hammer out twenty-dollar pieces lively. Dan thinks he will put up a stamp mill this summer. Work has been resumed on the old Chicago mine on the South Fork of Clear creek, under the management of some San Francisco parties. Mr. Buckley an old Comstock and Bodie superintendent is directing operations. The Spencer mine near Ono has developed into one of Shasta county's bonanzas. At the bottom of the 70-foot shaft, sunk from the tunnel level, the vein shows a width of 9 feet of $30 rock. The course of the vein is northerly and southerly with an inclination to the east of about 80 degrees. The hanging wall is slate and the foot wall is porphyry. Mr. Spencer has just put in a 12 ton crusher which started up Monday. It is his intention to erect a stamp mill during the summer.

Sierra.

AT THE SIERRA BUTTES MINE.—Sierra Co. *Tribune*, April 3d: On Saturday evening last the scribe paid a visit to the new mill at No. 9 tunnel, and under the care of two very accommodating gentlemen took a glance at the extensive improvements made there. The mill is a model of neatness and convenience, and contains every improvement which has been made in the past twenty years to the business of quartz mining. Forty stamps are crushing ore at present, and four more batteries of five stamps each are in course of construction. The water which furnishes the power comes from the dams above, and is used on a hurdy-gurdy wheel, under a heavy pressure. The quartz comes into the upper floor of the mill, and when dumped from the cars of fine quartz goes through the racks to the self-feeders, and the coarser to the ponderous rock-breakers where it is crushed to the requisite fineness. The rock being crushed in the mill at present comes from No. 8 tunnel, and is lowered to the mill through a long chute. The lower tunnel is on a level with the mill. A raise is now being put through between the two tunnels and as soon as this work is accomplished the quartz will be lowered through the shaft to the lower tunnel and conveyed out to the mill in cars. In the course of another year the works on the hill will probably all be removed to the lower level, a move which will greatly benefit Sierra City. To a person interested in mining, a visit to the Sierra Buttes mine is a great treat. It is one of the largest in the State, and the management has been reduced to a science.

A VISIT TO THE MARGUERITE MINE.—Last Saturday a *Tribune* reporter paid a visit so the Marguerite mine, and through the kindness of superintendent Myers, passed two or three hours very pleasantly and profitably in inspecting the new machinery and receiving information as to its workings. Unfortunately, just as everything was in shape above ground to raise the water out of the mine, the main pump gave way in one of its parts and the work of pumping out the lower levels had to be abandoned for the present. At the time of our visit there everything was being raised out of the mine with the exception of a pump on the upper level, which will be kept there to hold the water at that point until a new pump can be received from the foundry. The latter was to be ordered immediately and as soon as it can be built will be shipped to the mine. Superintendent Myers now thinks that he will have the mine pumped out and everything in order to begin raising ore in three months at the furthest.

A GOOD PROSPECT.—The above mine is situated in Lady's canyon, about one mile west of the Colombo ground, and is owned by Messrs. Abbe & Flint. Two men are employed there at present running a tunnel that is already in 130 feet, and 300 feet below the surface. They expect to tap the vein in 75 or 100 feet further. Three ledges, varying from 3 to 5 feet in width, have been discovered on the ground. It is expected that these ledges will unite in the tunnel now being run. Two shafts were sunk to a depth of 25 feet each, and 3,000 feet apart on the vein, and splendid prospects obtained. The location of the mine is one of the best in this part of the country for economical working. Water, sufficient to run forty stamps the year around can be obtained very handy, with a pressure of 350 feet.

PHŒNIX.—The parties who are interested in starting up the Phœnix mine, at this place, are expected here in a very short time to inaugurate the work. The lower tunnel, which is now in 100 feet, will be run ahead to the vein, which it is supposed will be reached in about 600 feet further. This tunnel will tap the ledge some 500 feet below surface. The Phœnix mine has been worked upon in a prospective manner for a number of years, and it has long been regarded by people in this section as one of the most promising mines ever discovered in the district. It is located only a short distance from the business portion of town, and the fact that it is to be worked is hailed as good news by everybody.

PUSHING AHEAD.—The Burleigh drill has been placed in position at the Colombo mine, and everything is working nicely. The indications are said to be very favorable for encountering the ledge soon in the lower tunnel.

Siskiyou.

PICK AND PAN.—Yreka *Union*, April 3: The Centennial miners on the Klamath are washing good pay gravel. Pyle & Cook at Deadwood are erecting another arastra and also a concentrator for working sulphurets. Martin Olsen has purchased the water flowing in Boulder creek, a tributary of the North Fork of Salmon, of P. F. Dunphy, for mining purposes. Mr. Samuel Finley writes us that there is a scarcity of water in the Salmon district, and that miners on the gulches have had to suspend operations. Mr. Wm. McConnell has commenced hoisting gravel, in his Klamath river claim, with one derrick, and will have another one in operation in a few days. Hugo Miller of this city has deeded to Wm. Pullen one-eighth of the Empire Bar mine, situated on Klamath river, a short distance below Honolulu. John Neal, Wm. Weakly, H. F. Kols and John Barton have recorded the location of 40 acres of placer mining ground on Klamath river, six miles below Oak Bar. Messrs. Charles Baird, A. McDonald, Jas. Amos and Jas. Garrett have located a gold-bearing ledge on Methodist creek, this county, only a few miles from New River City. It will be known as the Cleveland. Capt. J. D. Potts, J. W. Loomis, A. J. Loomis and Harry Loomis, all of Red Bluff, have located 80 acres of placer ground on McAdams creek, adjoining the Steamboat mine, owned by George Smith and others. The new location will be known as the Red Bluff. John Quigley, Sr., W. H. Quigley, Thomas Quigley, E. S. Quigley, John Quigley, Jr., and William Doggett have located on the north side of Klamath river, in Oak Bar mining district, 175 acres of placer mining ground, to be known as the Horseshoe Bar mine.

Trinity.

COMING AND GOING.—Trinity *Journal*, April 4: There are a great many men going to the mines at New River, and a few are coming out. Seven reached here this week on the return trip. Of that number, two had been in there two or three weeks, two were there two days and three turned back before reaching the mines. The latter were looking for work and went no further when informed that there was no chance to obtain employment. Among the others opinion was divided; one acknowledged the district promising but too young; two thought the prospects excellent, but that it was too early in the season to enter on regular prospecting; the other was disposed to condemn everything he saw or heard. Referring to this latter opinion in the presence of an old pioneer, he curtly replied: "Oh, that is the old thing. When I came to Trinity in 1850, I met a great many leaving this section who condemned the whole country, said the mines would not pay, and those which had paid were worked out." Mines here have been worked successfully from that day to the present, and to-day Trinity presents a better field for mining investment than any other section on the Pacific Slope. So it is with many new districts which ultimately prove of great and lasting value. Discontent is no small portion of the make-up of humanity; some people are never satisfied and will not look at anything but the dark side. A great obstacle to new mining districts is also found in the fact that a considerable proportion of the men who follow mining excitements go into a new camp and when they get there have no idea what they went for. Then they growl and complain. We have faith in New River.

QUARTZ ON HAY FORK.—A correspondent kindly furnishes us the following items regarding quartz prospects in the Hay Fork region: "As quartz is all the excitement in Trinity now-a-days, I thought I would say a word for Hay Fork. Within the last few months considerable prospecting has been done in this vicinity for quartz and with flattering success. The last find was by Ed. Newman and Dan Colbert, near Newman's ranch. Charley Farmer & Co. have a good paying ledge opposite the mouth of Big Creek. J. R. Vogdes is prospecting a well-defined ledge on Big Creek. Deidrick & Parlin have struck good rock on Kingsberry gulch. Carter & Graham have good well-defined ledges in the same vicinity. Good rock has been brought in from South Fork near Mr. Scott's. Considering indications we think we can come up with or beat New River. Have just heard that Walter James has struck a good ledge on Carrier gulch.

Tuolumne.

NEW MILL.—Tuolumne *Independent*, April 3: The new mill of Lang & Shaw, on the Kanaka mine at Groveland, is in operation and running smoothly. Everything about the mine and mill look encouraging and prosperous. They have one of Schofield's concentrators in operation to save the sulphurets, in which the rock abounds. Considerable very rich ore is on the dump, which awaits more water so that the mill can be run regularly. Mr. Hyde informs us that he has not sold the Hyde mine, and that he still owns it, rumors to the contrary notwithstanding. He has merely made arrangements to dispose of it some time in the future, on certain specified conditions being complied with. An engineer has been sent up to get the water out of the mine. Messrs. Shine and Oliver are again at work unloading their rich pocket at Brown's Flat. One day this week they took out $700.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, April 4: Cross-cut No. 3, west on the 2900 level, is now in 75 feet from the main lateral drift. The first ten feet, as has been heretofore remarked, amounts to nothing, being in the cast or hanging wall. Then commences the ore vein, which is well defined and will pay well under the stamps for a width of 40 or 45 feet. The rest of drift is in a sort of porphyry horse, with streaks of good ore, and the face of the drift still shows the same. It is a considerable distance to the west wall, giving room for improvement yet in that direction. On the 3000 level the main lateral drift north has been continued onward toward the Savage line, which is about 200 feet distant, and the face is in quartz and porphyry, the drift being run in the east or hanging wall of the vein. The two cross-cuts west, Nos. 2 and 3, which were recently started, had to be discontinued on account of insuffi-

cient air supply. Cross-cut No. 1 west will be started to-day, and for the reason just stated, work at the face of the lateral drift north will be suspended in order to give the air supply to the new cross-cut.

CON. CALIFORNIA AND VIRGINIA.—About 50 tons per day are being taken from the 1750 level on company account, the average assay value being about $20 per ton. A drift is being run to the southwest on this level toward the old Con. Virginia ground. The ground above, between the 1550 and 1200 levels, which is being worked under the Jones lease, is yielding about 50 tons per day, of the average assay value of about $30 per ton. The water is almost up to the 2000 level in the C. and C. shaft and is about at a standstill.

CHOLLAR.—On the 3000 level, cross-cut No. 1, west, at the Hale and Norcross south line, is in about 20 feet, and appears to be getting into vein matter. It is expected to cut the same ore vein as found in Hale and Norcross. West cross-cut No. 2, 100 feet farther south, is in about 300 feet, and cross-cut No. 3, 100 feet still farther south, will be started shortly. These cross-cuts west are all from the main lateral drift south, which is run in the east or hanging wall corresponding with the main lateral drift north in the Hale and Norcross on the same level.

YELLOW JACKET.—The whole upper portion of this mine is being extensively worked, from the 1150 level up to the sagebrush, or 200 level. It is principally low-grade ore, yet some spots and streaks of high-grade are occasionally met with, for instance at the 400 level. More men are employed at present in this mine than any other along the Comstock, yet it will take years to exhaust the immense amount of ore known to exist above the Sutro tunnel level.

KENTUCK.—The old upper workings still continue their regular yield of ore, principally low-grade, keeping the Rock Point mill steadily running. The 1350 level is being prospected through the Crown Point mine, but contrary to previous report, it yields nothing as yet, and only low-grade ore has been found in it thus far—none worth sending to mill.

OPHIR.—On the 1465 level the north lateral drift is progressing well through a favorable formation, and the same may be said of the south drift on the 1500 level, which is near the proximity of the old workings. The water from the old Mexican shaft is being slowly drained out through the 500 level.

SIERRA NEVADA.—The surface works are completed and were started into working operation yesterday. The repairs to the shaft and the drain tunnel are about completed, and operations on the 600 level will be resumed forthwith, taking out low-grade ore and prospecting for more and better deposits.

ALTA.—The main lateral drift north on the 950 level is out about 180 feet, with its face in favorable vein matter. Cross-cut No. 2 from this drift is now in about 40 feet, all the way in good-looking material. The water continues slowly rising and is above the 1250 station.

OVERMAN.—A winze is being sunk from the old Lambert tunnel to connect with an old tunnel 266 feet below in order to facilitate prospecting at that depth and test the merits of the low-grade ore existing there.

CROWN POINT.—The old upper workings, above the 1700 level, continue their good daily yield of low-grade ore, and the mills on the Carson river, having plenty of water reduce the ore as fast as they can get it.

GOULD AND CURRY.—On the 1600 level the lateral drift south is progressing at the rate of nearly 60 feet a week toward the Savage north line. The material is principally porphyry, with quartz and clay occasionally.

BULLION.—Prospecting in the croppings still progresses favorably, and the parties engaged in it have now secured the old Fairview shaft in furtherance of that object.

BELCHER.—Still yielding a considerable amount of low-grade ore, the leavings of bonanza days, which is taken to the surface through the Crown Point.

WOODVILLE.—The tributers working the 300 and 400 levels still find considerable quantities of good pay ore.

BEST AND BELCHER.—The north lateral drift on the 1000 level is running in porphyry and making good progress.

Castle Dome District.

THE NEW MINES.—*Silver State*, April 7: Encouraging reports continue to reach here from the new mines in Castle Dome district. Two of the the ledges discovered are over six feet wide, and there is a streak of ore, about two inches thick in one of them, that averages over $6,000 in silver to the ton. The owners are sacking a quantity of the ore to ship to Salt Lake.

Taylor District.

STRIKE.—Taylor *Reflex*, April 3: A body of wonderfully rich ore was struck in the Hayes ground Thursday, at a depth of 70 feet by Steve Seaman, Ross Humphrey and Chris. Ostigard, who have a lease on the ground for six months. Much of the ore will go between two and three thousand to the ton. The Hayes ground adjoins the Monitor on the south and is owned by James Fitzpatrick, John Verzan and George Willams. The lessees and owners of the mine are on the high road to fortune and no mistake.

Tuscarora District.

INDEPENDENCE.—*Times-Review*, April 3: Main drift south, on the 400-foot level, has been extended 27 feet; total, 1,146 feet. Cross-cut east, same level, in very hard rock. Progress two feet. Drift south, on the vein encountered in this cross-cut, has been extended three feet. There is no material improvement.

BELLE ISLE.—The usual progress has been made in the drift north from No. 1 cross-cut, 450-foot level. Have started a drift north on the west vein, 250-foot level. Upraise on the west vein, 260-foot level has been carried up 12 feet, encountering some good ore. Nothing special to note in the other workings.

NAVAJO.—Work was suspended a couple of days the past week, while the boilers were being cleared. On the 650 foot level, the south drift was extended 17 feet, and the east cross-cut the same distance. Good progress has been made in sinking the winze from the 350-foot level. The usual progress has been made in No. 2 east cross-cut. Upraise on the east vein has been extended seven and a half feet; total length 110 feet.

Red Canyon District.

AT WORK.—Carson *Free Lance*: Red Canyon is still alive. Seven or eight men have been steadily at work all winter in the various mines of that district with more or less encouragement. The discovery made in the War Horse, which was made in these columns a short time ago, grows more important every day. Gray & Carter are drifting on the ledge, which continues to increase in size and richness as they advance into the mountain. They now have over 3 feet of good milling ore and the ledge still bearing to the east instead of north, as was heretofore supposed. Some very fine prospects have recently been discovered in the southern extremity of the Red Canyon range of mountains, near Walker river. Two ledges of quartz, well sprinkled with free gold, have been discovered, and one of them prospected for a distance of over 3,000 feet along the surface, and by a series of twenty or more ditches and shafts varying from 5 to 50 feet deep. There are no facilities greater than a hand-mortar for reducing the ore and only a very small proportion of it will pay by this process. The owners advertise elsewhere for assistance. They hope to interest parties who will co-operate with them and determine what character of reduction works, if any, are justified. There is now almost sufficient ore in sight to warrant the erection of a small gold mill, and they are very anxious to get parties to go and look at the prospect. Altogether the mining outlook south of us is brighter than usual, and a revival may be expected at any time.

Reese River District.

THE UNION MINE.—Reese River *Reveille*, April 3: The shaft of the Union, after an idleness of 18 years, has been drained by the Manhattan Company. It is 200 feet deep and at the bottom a cross-cut running south has also been drained and it has been explored to a distance of 250 feet. At this point a cave prevents further progress until it is repaired. The impression is that this cross-cut was run 400 feet before the endeavor to find the famous Whitlatch ledge was given up. This cross-cut will be continued as soon as the shaft and cross-cut are in proper shape for working, and if the famous lost lode is found Austin will have another boom.

ARIZONA.

VEKOL MINES.—Cor. Arizona *Herald*, April 4th: This mine is situated thirty miles south of Casa Grande, in one of the numerous foot-hills that jot this desert; altitude about 2,500 feet and under the direct influence of the gulf current. The Vekol (Old Grandmother) was discovered in 1880 by J. D. Walker, and is owned by J. D. Walker & Bro. The ore is chiefly chloride. Development commenced in the following August. The silver product of two men the first day was $59. The ore is assorted at the mine, and the best is shipped East for reduction, averaging at least $300 per ton. There are more than 5,000 tons of second class ore which will average $50 per ton now on the dump. There is a ten-stamp mill here, but owing to a failure of the parties to comply with their contract the Walker Bros. have not received it. But we are told that the ore will not spoil, and that it is a safe investment as it now lies upon the dump. About forty men are employed, chiefly Mexicans and Indians. The quantity of ore appears unlimited. There is but little waste labor. The south extension is a continuation of the Vekol. We predict that on some future day this property will rank among the first in the Territory. The ore is abundant, the silver is in it and it is free milling.

TAILINGS.—Prescott *Courier*, April 3: The fine 10-stamp mill of the Peak Company, at Alexandra, in this county, is being fixed up for a long run on Peek tailings. Mr. W. C. Dawes has a lease of the mill and the right to work the tailing. He has had them assayed and sampled, has engaged a good mill man and will, undoubtedly, make money out of them. These tailings have been exposed to the weather for years and may yield their treasure freely. The mill is located in a splendid mining region, convenient to a great many ledges which contain gold as well as silver, so that there is great hope of a lasting boom in that section. Meeting Mr. Craigue on the street, yesterday, we questioned him concerning prospects at the Sterling mine. He was mineralogically happy and assured us that the old mine is looking first rate. His men are now driving a winze. The vein is very large and the ore carries sufficient gold to pay for fooling with it. The company will, ere long, have a 15-stamp mill crushing the ore. The Sterling is about 5 miles south of Prescott, in the pine timber. Robert Thompson, of Agua Fria district, 18 miles east of Prescott, came in Saturday last. He owns in the Mountain Chief mine, which is a good strong vein of silver bearing rock. It is not far from Lawler Bros'. fine mine. Under-Sheriff M. L. Lawler is in receipt of a letter from his friend E. G. Wager, of Humbug district, in which the writer states that the Humbug mill is doing well on silver ore and will very soon be set to work crushing gold rock. No new strikes are reported, but old ledges are yielding considerable rich ore. Mr. Smithline has returned from New Orleans. He told his brother miners that the Arizona mineral exhibit was chief. Miners of Humbug district are praying for somebody to come along and build a railroad. Returns from placer mines now being worked are very cheering. Tracy's placer, Hassayampa creek, is yielding plenty of coarse gold, so are the Lynx creek hydraulic and sluice diggings and the diggings near Walnut Grove and Wehver. Riggs & Co. have made a good cleanup, on the lower Hassayampa. Black Canon claims are rewarding those who are working them. Messrs. Sam Bright and Geo. E. Berry find trouble in getting to the bed-rock in their claims on Groom creek, but prospects which they get out of loose gravel are very encouraging. Mr. Joe Tappan, foreman of the Conger mine, arrived yesterday, and last evening told us that there is enough gold ore in sight to keep the mill running three months.

COLORADO.

WASHINGTON GULCH PLACERS.—Elk Mountain *Pilot*, April 2d: There is a rumor that considerable work will be done on the placer diggings up Washington Gulch this season. There has been some work done there for several years, and a little gold taken out, but the manner of working has been so crude that it has made but very little showing. We believe that with a capital of $10,000 expended in hydraulics, that the ground would pay handsomely, and be a most profitable investment. So long as it is divided up among men who are too poor to go to the expense to properly work the ground, there will never be much benefit derived from it, but if the different owners would put their claims together, form a company, and raise sufficient money to systematically work the gulch, we firmly believe it would pay handsomely. Over twenty years ago a large amount of gold was taken out, and we are inclined to believe that it was not all taken out by any means. A little work has been done in Redwell Basin all winter, and if there was a smelter here that required heavy lead ore, Redwell would attract no little attention, as the veins are large galena veins, and it will require a home market to use the ore that is found at present. Mr. Groesbeck, the foreman of the Augusta mine, was in town this week, and reports that at the crosscut from the shaft 230 feet, the ore is found even better than above, and carries more gold if anything.

JUNCTION CREEK GOLD.—Denver *Tribune-Republican*, April 2d: Our city has been in a fever of excitement to-day over more gold discoveries at the head of Junction Creek. Our miners have been in a state of excitement ever since the strike of a month ago, but on account of the snow no one was willing to tackle it until last week, when some miners were sent up there to look after some placer ground. The snow was off only on the southern slope, but the men commenced work, and in running a ditch about five feet deep, they struck some very rich dirt. About two dollars' worth of gold was shown here that had been washed out of six or eight pans. The gold strike is in everybody's mouth. A corporate company was formed to-day by thirteen of our best citizens to work the property. These gentlemen will put up sluices and make extensive preparations to work their property as soon as the snow will permit. A second company was formed this evening and parties have started for the head of Junction Creek to-night, so as to be the first in the morning to locate their land. The excitement is running so high that developments may be expected very fast from this on, although the snows in the La Platas will retard the progress to some extent.

IDAHO.

BAYHORSE.—Idaho *Messenger*, April 3: Johnny Spaulding and Jas. W. Hamilton came over from Bayhorse, last evening. Mr. H., we learn, is down from the Beardsley mine to make the last payment, to-day or to-morrow, of $40,000 on the bond on that property. This mine was bonded six months ago for $45,000, and in these six months it has produced enough ore to pay for the driving of 700 ft of new works and, also, to pay the entire bond. The mine has now more ore in place and is in better for shape working than it ever has been.

MONTANA.

ANACONDA HILL.—*Inter-Mountain*, April 2: A few years ago, before any big mines were opened on Anaconda hill, a professional mining "expert" told a reporter of this journal that there was no ore in "that vast porphyry dyke" and cast ridicule at a few men who were seen digging a prospect hole near its summit. That same barren porphyry dyke, however, produced over $4,000,000 last year from the Mountain View, Anaconda, St. Lawrence, Parrot and the various Parrot fractions. All last summer and winter it produced 1,200 tons of ore per day, and there is now more ore in sight than ever.

MOUNTAIN VIEW.—In the Mountain View explorations are active and ore is abundant. The face of the east drift from the 600 ft south crosscut shows 12 ft of high grade copper ore, from which crude shipments are regularly made. In the north vein drifting is actively progressing westward on a fine body of copper glance.

ANACONDA.—The Anaconda is maintaining a steady daily product of about 600 tons, which vast amount is regularly shipped to the smelter. This product comes from various parts of the mine from the 300 to the 800 ft levels inclusive and some of it is reduced without concentration. The matte shipments from the smelter are about 90 tons per day.

ALICE.—The condition of the Alice properties is not much changed since last report. The Cornish pump continues to give perfect satisfaction and saves the company about $50 per day or $18,000 per year. It is in contemplation to sink the shaft at once to the 1,000 ft station. It will take some time to tap the ledge after the sinking shall be finished as the assurance of a mining "expert" some years ago, that the vein would dip south from the 500-ft level, seems to have been based on imperfect scientific conclusions. Very little has been published about the ore on the 800-ft level, but its appearance is evidently encouraging. Good reports are received from the 300-ft level, from which some high grade ore, containing considerable native silver is being extracted. The Magna Charter ore product remains at about 70 tons daily of good milling quartz. The shaft is being enlarged and the Cornish pump mentioned before will soon be placed in position.

LA PLATA.—The La Plata, under the supervision of James A. Talbot, holds its own as an ore producer. The face of the 350 ft east drift shows three feet of 35 ounce ore upon which steady inroads are being made. The supply, however, is abundant and the stopes shows no signs of exhaustion. The output is being worked at the Silver Bow mill.

ORPHAN GIRL.—The Orphan Girl continues to yield from the upper level about 30 tons daily of $30 ore. The main shaft is now completed to the 300 ft station and drifting for the bonanza shoot will at once begin.

BARNARD'S MINES.—Wayne Barnard, who recently returned from the east, has started up his Missouri gulch placer mine, and will probably resume operations on the Andy Johnson and other well-known properties in which he is interested. The Poser is being vigorously worked under lease and producing plenty of ore.

GENERAL NOTES.—The Bummer and Occidental, two promising prospects near the Big Butte, owned by McDermott, Leggatt & Co., have been recently leased and bonded to Sutherland & Co., for $50,000. The Gem copper and silver property is to be actively worked the coming season. The Montana smelter is in full blast on ore from the Colusa and other copper properties of the company. The Clear Grit is producing daily from 20 to 25 tons of 40 ounce ore, carrying some copper. The bullion shipments to-day were Moulton, 8 bars; Alice, 6 bars; Old Lexington, 1 bar. Total valuation, $18,500. The owners of the Germania are preparing to begin the exploration of that property. The Stevens is looking well on the 200-ft level and making regular ore shipments to the Silver Bow mill.

NEW MEXICO.

BULLION.—Silver City *Enterprise*, April 3: The Mimbres mill has been closed down for repairs. It started up again this week. During the past 60 days $53,000 in bullion and $3,000 in concentrates has been shipped from this mill. An important strike of horn and native silver is reported from the Cooncy mine. The body is said to be extensive and very rich, and promises to be an important feature of the mine, which already takes the lead as a producer of the precious metals in this section. Ore shipments will soon begin from the Silver King mine, at Bald mountain, which is being worked by Mr. Lewis and others under lease. A report from the Mogollons to effect that a mill and concentrating works will shortly be erected at Alma is the latest. About $50,000 worth of ore has been taken from the Rose mine, and is now sacked and ready for shipment. Work was commenced on the Rose less than four weeks ago, and all of this large amount of ore has been taken out since that time. There was 110 miners thrown out of employment at Lake Valley on Tuesday night. The superintendent posted a notice advising the men to seek employment elsewhere, as the date for again resuming work is very indefinite. Many of the miners have gone to Colorado, others have sought work at Georgetown and adjacent camps throughout the Territory. M. W. Stone has made a location on the south end of the Burro claim, at Fleming, on which some very fine mineral has been found, but as we understand, not in place. Mr. Stone and partner are prospecting the ground carefully, and it is believed that the ledge will be uncovered before any great depth is attained. Jack Sherwood has staked and started out no less than 7 prospectors, during the past month. Jack has a "prospecting" stake set aside which he intends expending upon experienced prospectors, who, if they are fortunate enough to "strike it" will do the fair thing by their benefactor. The richest carload of ore ever shipped from the Old Man mine was sent off this week. It was taken from the recent strike made in the west tunnel. The ore is of that characteristic rich horn silver kind for which the Old Man has become noted throughout the mining world. The body shows no sign of diminishing but seems to increase in extent, and may yet turn out to be a bonanza for the company and county. Lone Mountain, after nearly two years of idleness, so far as mining is concerned, is again coming to the front and entirely on its merits as a mineral producing camp.

OREGON.

PLACERS.—Jacksonville *Times*, April 3d: More prospecting than ever is promised this season. Some prospectors are in the Evans creek district and speak well of a number of ledges there. Jackson county still has some of the best mines on the coast. All that is necessary to prove this is capital. Henry Klippel, J. C. McCully, Jas. Lawrence and Adam Ruhl have gone to Beaver creek and vicinity on a prospecting tour. Simmons, Ennis & Co., of Josephine county are about putting in a huge flume, and expect to put their mammoth enterprise in working shape this year. E. J. Curtis of the Siskiyou mountain has been to the New River Cal. mines, and returned home last week. He is not favorably impressed with them, though a great many others are. Geo. H. Chick of Portland paid the Schumpf ledge in Willow Springs precinct a visit during the week. He speaks in flattering terms of the future of that mine, and thinks it can be sold for a round sum. Enoch Gale of Grave creek was in town the forepart of the week. He informed us that most of the miners of that section will not be able to clean up, owing to the scarcity of water, and consequently their season's work will not amount to much. Chris. Kretzer, who is mining on one of the gulches above Jackson creek, recently found a good-sized nugget of gold and silver. Strange as it may appear, the larger per cent of it is silver. A large piece of the same component parts was found in that neighborhood some time ago. Considerable excitement is raging over the discovery of a large amount of quartz, near the head of Gall's creek, which is supposed to be rich with silver. An assay of some of the ore made by J. H. Fisk of Portland shows it to be of a very promising character.

UTAH.

REVIEW.—Salt Lake *Tribune*, April 3: The weather continues fine, with every indication of an unusually early spring. But the movements of the metals continue light. The shipments out from this city for the week ending Saturday, March 28th, inclusive, were as follows: 113 cars or 2,881,643 lbs. The receipts of bullion in this city for the first three months of the present year, exclusive of ore receipts, and of operations making no current reports, were as follows: January, $378,644.56; February, $237,536.78; March, $273,771.69; Total $889,953.03. The receipts of this city for the week ending April 1st, inclusive, were: Of bullion, $72,519.25; of ore, $12,890; total, $85,409.25. For the week previous the receipts $44,798.44 of bullion, and $5,275 of ore. Reporters of the *Tribune* hear of some shipments by the Horn Silver, but as the rumors of the amounts differ and are certainly in some cases exaggerated, it will be best to wait the regular and authorized statement before attempting to give figures. Ontario shipments for the week were 48 bars of bullion, valued at $35,209.25, bringing the total shipments for the three months of this year up to $434,164.77. Silver Reef sent up during the week two bars of silver, $3,010, from the Christy; and two bars from the Stormont, $3,100, a total of $6,110. The product of the Hanauer smelter for the week was 12 cars of bullion, $31,200. Ore receipts were: From the Honerine, Utah, two lots, $8,060; from the Crescent, $1,960; from Wood River, $2,870.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal.
Manufactured only by JENKINS BROS., 71 John St., New York.

American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAW-SET. — William Kopf, Santa Rosa. No. 314,944. Dated March 31, 1885. This consists in a framework provided with a reciprocating hammer adapted to operate against a suitable die; in a peculiarly adjustable bench or rest, secured to the frame and adapted to receive and support the blade of the saw at any angle and at any distance from the die, and in an adjustable guide for the different lengths of teeth. It further consists in the details of construction by which the bench or rest is adjusted to or from the die or plane of the hammer, and up or down to support the blade at any angle with the horizontal plane of the die.

LIFTING-JACK.—Thos. Phares, Eureka, Humboldt Co., Cal. No. 314,716. Dated March 31, 1885. This new lifting-jack has a novel oscillating head, which is provided with two alternately-acting pawls. These are adapted to raise a rack-bar so as to elevate anything which may be placed upon the top plate. In combination with this mechanism is provided a friction-clamp, operated by an eccentric or cam, so as to press against the rack-bar when desired, and a means for releasing the pawls, so that be rack-bar and its load may be lowered at will by the use of the friction clamp, while the pawls are held out of contact with the bar.

FLOORS AND AREA COVERINGS.—Peter H. Jackson, S. F. No. 314,677. Dated March 31, 1885. This invention relates to certain improvements on fire proof floors, pavements or area coverings; and it consists of a surface of artificial stone or concrete, either with or without illumiuating tiles set thereon, together with corrugated metal plates, strengthening bars or ridges in connection with said plates and metallic ties for the same.

Mining Share Market.

The principal interest this week was centered in Hale & Norcross, and the stock has changed prices in a marked degree. This is supposed to be due, of course, to the deep ore development now being made at the 2400 and 3000 levels of the Hale & Norcross, the only mine now working below the surface of the flood, so to speak. Both portions of the great lode to the north and south are submerged so far as their lower levels are concerned, and the hot water flood allowed to have full unrestrained possession. And it would have been the same with the middle mines had it not been for the small streak of good ore found on the 2600 level of the Hale & Norcross, which has been steadily followed down to the 3000 level, where its true merits will soon be ascertained. This could not have been done were it not for the powerful and capacious hydraulic pumps of the Combination shaft which easily keep the lowest levels free of water, notwithstanding the flooded mines of the north and south.

The Virginia *Enterprise* says that active work is being done in the extraction of low-grade ore from the extensive bodies known to exist in the upper levels, and hundreds of miners are thus employed, to say nothing of the mills. This work is almost exclusively confined to the Gold Hill section, but work is to be resumed in the old Chollar croppings before long; also, in the Cedar Hill. At the Monte Cristo mine, the Lady Bryan, in Flowery District, considerable ore is being extracted from the surface workings and milled at a fair profit. Various other outside mines and locations are being worked or prospected, both to the eastward and westward of the Comstock range, and more men are employed or engaged in this chief industry than people generally are aware of,

MIKE SHINE and Dave Oliver returned from San Francisco last week. Their pocket panned out about $12,000. The gold was very fine, coining about $19.48 an ounce. The boys have gone to work again to take out more gold.—*Union Democrat.*

POCKET ALTITUDE BAROMETERS. Muller's Optical Depot, 135 Montgomery street.

Market Reports.

Lumber at Wholesale.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if t is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY THE LABEL ON YOUR PAPER.

METALLURGICAL APPLIANCES.—We had a conversation this week with Dr. J. H. Rae, of Boston, a well-known inventor in metallurgical lines, who has come to this coast for the purpose of introducing some of his patents. We described, a few months since, the electric sodium amalgam manufactured by him. He is managing agent for the National Vacuum Dredge Co., for river, creek and beach mining. Dr. Rae is at present engaged principally with appliances for utilizing vapor fuel, and has at work in his office one of the vapor burners for stoves for domestic use. He has shown us the drawings of his smelting and roasting furnaces, in which the vapor fuel is used, this vapor being a highly heated product of crude oil and superheated steam. The method of utilization is quite simple and appears effective. We shall shortly give a more detailed description of this vapor fuel smelting and roasting plant. Dr. Rae is a pioneer in the matter of the application of electricity to the reduction of ores, and has patented a number of inventions. At his office, 240 Montgomery St., he has models and plans of a number of things of interest to the mining community.

THE MINING BUREAU.—The State Mining Bureau will hereafter be managed by a Board of Trustees, the State Mineralogist acting with their advice and co-operation. The law which makes this change was passed by the Legislature at its last session, as we mentioned at the time. The Governor last week appointed as Trustees the following gentlemen: George Hearst, Alvinza Hayward, J. Z. Davis, S. Heydenfeldt, Jr., and William Irelan, Jr. The State Mineralogist, Mr. Hanks, is at New Orleans, in charge of the California minerals. The Mining Bureau will be removed from its present quarters to the new Pioneer building on Fourth street, near Market, as soon as the building is completed, where it will have better facilities.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

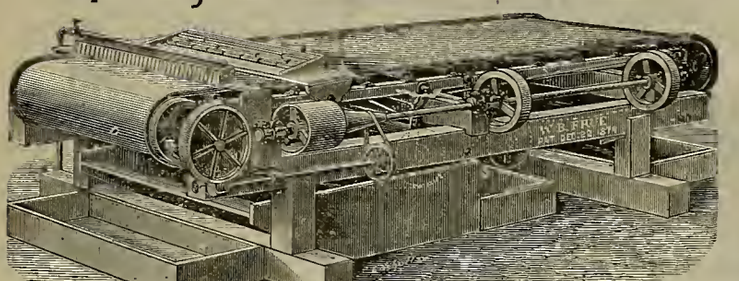
JUSTINIAN CAIRE, Dealer in Mining Material, Agent, 521 and 523 Market St, San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on pateuts owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!

THE "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue" Vanning Machines**, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarly saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000,** flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St., San Francisco, Cal

PACIFIC IRON WORKS

RANKIN, BRAYTON & CO.,

....BUILDERS OF....

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

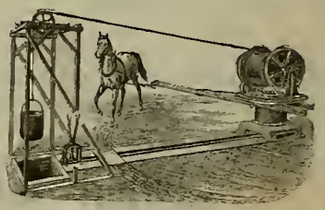
For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.



Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

HOISTING WORKS.

NOTICE

Is hereby given that a meeting of the stockholders of the Lord of Lorn Gold and Silver Mining Company (a corporation) will be held on the 11th day of May, A. D. 1885, at one o'clock P. M., at the office of said corporation, in room No. 6, in building No. 318 Pine street, in the City and County of San Francisco, California, for the purpose and with the object: First, of increasing the capital stock of said corporation, so that the whole amount of par value thereof shall be $10,800,000, divided into 108,000 shares of the par value of $100 each; and, Second, to repeal the by-laws of said corporation, or any part thereof, and to amend the by-laws, or to adopt new by-laws therefor, as said meeting may determine. By order of the Board of Directors and Trustees, and of the President. March 7, 1885. JAS. T. McDOUGALL, President.

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

SAN FRANCISCO, SATURDAY, APRIL 18, 1885.

VOLUME XLXX Number 16.

The Hesse Water Meter.

It is claimed that nearly one-half of the water consumed in our cities is uselessly wasted. It is douhtful if this lavish consumption is on the whole a sanitary benefit, the waste being in large part the result either of leakage or of willful negligence, and not of a character to effect any proper flushing of closets and sewers. By placing meters near the point where the sewer pipes enter the premises, and thus making consumers responsible for such negligence and for defective plumbing, a wiser use of water is effected. In order to prevent the penurious consumer from pursuing an economy so stringent as to result in certain sanitary evils, it is recommended that a minimum quantity of say 10 or 20 gallons per capita per diem he established, and the consumer charged for this whether he uses it or not. The water department of Providence, R. I., makes a minimum charge of $10 per year (equivalent to ahout 100 gallons per diem) for each meter service. Metera were provided in Providence for ahout one-half the total number of services, and a decided economy effected. The daily consumption at present is ahout 350 gallons per service, or 25 to 30 per capita—less than one-half the average in American cities.

When the water supply of a city employing

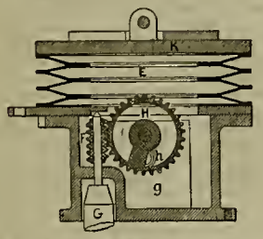

Fig. 3.—Vertical System of Diaphragm.

few meters hecomes inadequato to meet the demands of the consumers, two propositions may he entertained: the increasing of the capacity of its water works, and the introduction of meters. It is maintained that in most cases the latter proposition is by far the most economical.

It seems inevitahle that the meter system should rapidly grow in favor with improvement of the present forms of meter. In a few cities their use is already extensive. In London nearly 40 per cent. of the houses supplied hy the various water companies are now provided with meters. In New York and Boston meters have heen introduced into from 5 to 10 per cent of the services. In Providence, R. I., 50 per cent. In San Francisco, 20 per cent. In Oakland, 3 or 4 per cent.

At a recent meeting of the Technical Society of the Pacific Coast Mr. Ross E. Browne, of the University of California, read a paper on "Water Meters," in which were given comparative tests of accuracy, delivery, etc., and the distinctive features of typical metera, such as the Worthington, Kennedy, Siemens and Hesse. The latter is a meter devised hy Prof. F. G. Hesse, of the University of California, and is of the class known as velocity or inferential meters. We give engravings of the new meter on this page. The operations of this meter as described hy Mr. Browne, are as follows:

The water from the inlet pipe enters channel *A* (fig. 1), passes through openings *a a* (figs. 1 and 2), and striking the huckets *b b*, imparts motion to the measuring wheel—a pressure wheel similar in character to that of the "German" Siemens. The water passes then from the wheel chamber *B* into chamher *C*, mainly through valve opening *d* (fig. 1), and in that portion of the water which passes through chamber *g*. In the position of the worm wheel shown in fig. 3, the solid arm of the wheel (the cause of this interruption) is just passing the openings *f* and *h*, hence direct flow through

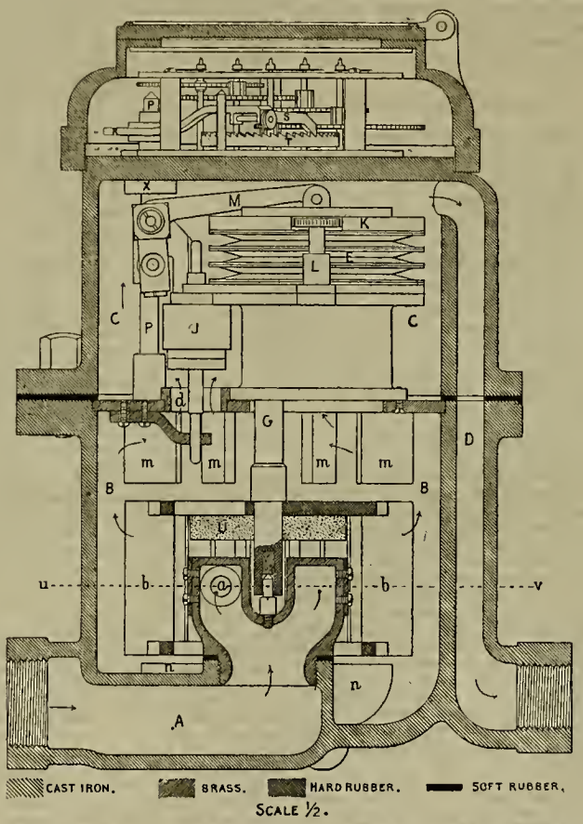

FIG. 1.—VERTICAL SECTION OF HESSE WATER METER.

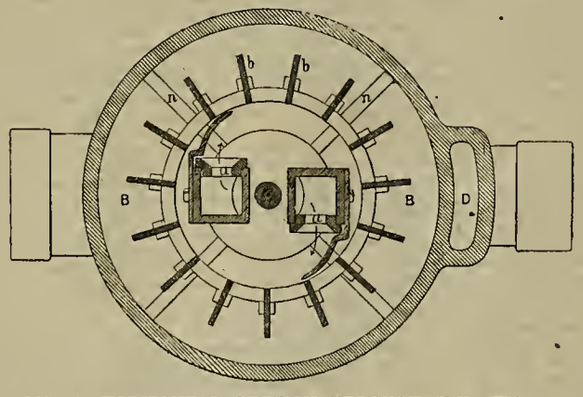

FIG. 2.—HORIZONTAL SECTION THROUGH U-V. (FIG. 1.)

part through chamher *e*, opening *f*, chamher *g*, and conical tuhe *h* (figs. 3 and 4), and is finally discharged through chamher *D* into the outlet pipe.

The motion of the measuring wheel is transmitted to the worm wheel *H* (figs. 3 and 4), hy means of the endless screw *F* (fig. 3) which is attached to the upper end of the wheel spindle *G* (figs. 1 and 3). This worm wheel, in revolving, interrupts intermittently the direct flow of these openings is just heginning. During the interval of direct flow the action is comparahle to that of the jet pump, causing the pressure in chamher *g* to fall helow that in chamher *C*. The interruption of the direct flow causes the pressure to rise ahove that in chamher *C*.

The alternating high and low pressures in chamher *g*, thus induced hy the slow rotation of the worm wheel, cause the cap *K* of the helows-like ruhher diaphragm *E* (figs. 1, 3 and 4) to rise and fall accordingly. Tho number of such pulsations or atrokes is directly proportional to the number of rotations of the measuring wheel. The length of the stroke is limited hy the heads of set screws *L L*.

This reciprocating motion of the cap *K* is transmitted and converted into the circular motion of the gear wheels of the index, through a lever, rock-shaft, shaft, lever, pawl and ratchet wheel *T*.

The dial hands are thus made to register a quantity which is directly proportional to the number of revolutions of the measuring wheel. The measuring wheel is made of hard ruhher of specific gravity 1.2, aud with the cork attachment (*U*) has the same weight as an equal volume of water. [The cork attachment is really unnecessary as the weight of the wheel or water is sufficiently small without it.] There is then so little pressure upon the journals of the spindle *G*, that the frictional resistance offered is exceedingly small. The worm wheel *H* resta loosely in its hearings, offering hut little resistance to rotation. Since in 38 revolutions of the measuring wheel hut one revolution is given to the worm wheel, the work and hence the effective resistance is minute. The frictional resistance due to the periodic pressure upon the journals of the worm wheel, as

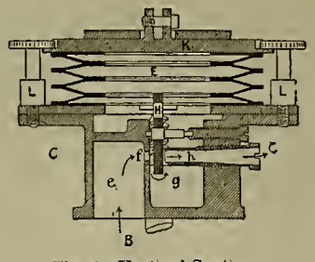

Fig. 4.—Vertical Section.

the arm passing openiug *f*, was found hy experiment to he very small.

When the meter is delivering water at ratea ahove three or four gallons per minute, the valve *J* ia lifted, hut the difference of pressures in chamhers *B* and *C* is far greater than that needed to operate the hellows. When the rate of delivery is small, the valve is seated, and the entire quantity is forced through chamher *g*, insuring the action of the hellows.

The alternate rise and fall of pressure in chamber *q* furnish an ahundant surplus of power to provide against undue resistance in the stuffing box X (Fig. 1), and all differences due to the character of the workmanship, and to wear or corrosion of the parts of the registering apparatus.

The measuring wheel does not supply the power expended in moving the registering apparatus, hence the unavoidahle changes in the latter do not affect the accuracy of the meter. This points to the distinctive feature of the Hesse meter.

m m and *n n* (Figs. 1 and 2) are stationary ribs provided for the purpose of checking in part the rotation of the water iu chamher B, and offering additional resistance to the motion of the wheel. Such resistance diminishes the detrimental influence of the solid friction and causes almost immediate stoppage of the wheel in case the water is suddenly shut off. Entire weight of meter is 21.4 pounds.

The material used in constructing the meter is shown hy the manner of shading the sections.

CORRESPONDENCE.

Forest City Gold Mines.

EDITORS PRESS.—Since the disastrous and sweeping fire of a little over two years ago, that destroyed all the business houses and many private dwellings of Forest City, another town of far more beautiful and commodious structures has been, as if by magic, rebuilt on the site of the old, and the sunshine of prosperity has continually brightened the streets of this noted pioneer mining camp. The population is large, and the people are generally prosperous. How could this be otherwise, encircled as they are with these lofty, snow-clad mountains, inlaid with gold? Wishing to visit these Aladdin caves of subterranean wealth, your correspondent gladly accepted an invitation courteously extended to him to take a trip through the Bald Mountain drift mine with the acting superintendent, Wm. Meikle (State Senator Wallis has returned from Sacramento since, and assumed his position as superintendent of the Bald Mountain). I seated myself in an empty car, and soon the mouse-shaped locomotive whistle shrieked *adios*, and our train, filled with miners and their tin pails, and heavy timbers and other material needed underground, was rolling over the steel rails at a fearful speed through the crooked tunnel for upward of a mile or more to the lava flow, under which is now being found cemented, black-colored gravel that averages at least $10 per carload. The tunnel formerly extended 3,200 feet further ahead up to the Ruby line, but has been closed. While coming back with the pillars, all that remained unworked of the rich gravel lead has, within the past few years, aggregated a gross yield of over $4,000,000, fully half of which has been divided by the lucky stockholders. At one period more than two hundred men were constantly employed. There are now but forty names on the pay roll. Length of incline, 146 feet—44 feet perpendicular. Six men work the windlass, 22 drift, 2 run the cars and the rest are busy on repairs. The air is so light that no powder is used. Five hundred carloads of pay gravel are rolled out each week. At some very remote period in the past a wide, auriferous river flowed down through the upper country. The bed of this stream was evidently cut later by a deep channel, afterwards filled with lava. The gold found here is exactly similar in color and form to that of the Bald Mountain Extension lead over a mile northeast further up the ridge, the difference in value being but 23 cents an ounce. The width of this gold channel probably is not more than that which was swept away, unless the deepest, ancient river gravel also is rich with gold; and, if so, it must be of a different character than what is now found. In such event the future of the Bald Mountain may be as brilliant and prosperous as has been its past history. The sale of bullion from this mine from January 1st to December 31, 1884, was $111,216.37; and from January 1st to March 22, 1885, $32,068.29, a total of $143,284.66. Cost of labor from January 1st to December 31, 1884, $52,084.05; from January 1st to March 22, 1885, $11,169.75, total $63,253.80.

March 18th a dividend of $18,000 was declared, $900 to the interest. In places the gravel is found on benches below the lava. Thus far but little water has been tapped, thus rendering practicable the present mode of working. Returning to daylight, your correspondent was rolled out in an empty car by one of the miners, the time being seldom beaten by the usual speed of the railroads. The next day I was kindly invited by Supt. W. Lawry, of the Bald Mountain Extension, to visit that mine, and, at an early hour in the morning, with the day shift, we were drawn in cars through the main tunnel by mules to the foot of the incline at the eastern side of the lava flow. The main tunnel is an air-line for 2,350 feet with a grade of ½ inch to 12 feet. Nine hundred feet of this was blasted through lava. The entire length of main tunnel is 6,285 feet, the face of which is fully 500 ft. under the surface of the mountain; width of second lava flow, 1,300 feet; steel rail is laid for 2,700 feet. The main tunnel is in first-class order. Average number of carloads of gravel taken out daily, 200—26 trains of eight cars come out each 24 hours. A horse-shoe is suspended over the entrance to the main tunnel for "good luck." At the incline the loaded cars coming down pull up the empty ones by means of a wire cable three-fourths of an inch in diameter, unrolled from a drum at the top. There is a self-acting switch in the center of the incline, the widest part, where the cars pass each other, the balance of the way there being but a single track. The gold lead is now being followed north, and nuggets weighing from a half-ounce to 1½ ounces are frequently picked up by the miners in the breasts. The pay gravel extends only one or two feet above the bedrock. The gravel is of a whitish color, making it very difficult for an amateur to see the gold. The face of the main tunnel is now partly in gravel. Length of the incline is 260 feet. There are 54 names on the pay-roll. In time the probabilities are that as the ground is more thoroughly opened this number will be largely increased—perhaps to 200, as was the case with the Bald Mountain in its brightest days. The gold assays from 941 to 9,515, and is sold to Chas. Heintzen at Forest City, at $18.60 per ounce. There is but little water in the breasts of the north. Between the two lava flows the main tunnel passes through a dike 45 feet wide, and the rest of the distance is bedrock, but little of which is hard. During March, 1885, there were 18 pounds of gold, lacking one pennyweight, taken out of the mine. The clean-up, April 5th, for the previous six days' work, was 130 ounces. The gross gold receipts for 1884 are $69,125.54; paid for labor, $41,061.86; gold dust sold from Jan. 1st to Feb. 28, 1885, $8,372,72; paid for labor in that time, $6,321.75. Total value of bullion produced by the Bald Mountain and Bald Mountain Extension for 1884, $180,341.91, of which sum $93,145.91 has been paid to the miners, besides the settlement of timber and other supply bills. With such a princely revenue is it strange that Forest City is one of the most prosperous mining camps in the Sierra Nevada? And, better still, the prospect is deemed to be certain that this income is but a trifle compared with what will be yielded by these mines in the near future. The Bald Mountain Extension lead extends for miles up the ridge and beyond through the Arizona, Wallis Consolidated and Savage locations, all of which will eventually be developed into good-paying properties, lucrative investments for their owners, pouring forth a constant tribute to the treasury of the world. The Ruby drift mine clean-up, Sunday, April 5th, for the past week's sluicing, was 107 ounces, a large increase on previous returns that will be cheering news to its energetic and persevering owners, most of whom are residents of your city. Let the good work continue. It makes none the *poorer*, and many *do* enrich themselves and their friends in the development of our seemingly limitless treasure fields. PROSPECTOR.

Forest City, Sierra Co., Cal., April 5, 1885.

California Chrome Ores.

The State mineralogist is satisfied that the chrome ores of California are being sold too cheap. Of course, it is the policy of those who require these valuable ores to buy them at the lowest possible price, but it is not to the advantage of the State to deplete all the mines, and ship away the ores which should be saved for that time, not very far distant, when California will be a great manufacturing State. At the present ruinous prices, European consumers can afford to buy and store the ores, which the Californians are willing to dispose of at a trifle above cost of mining. The bane of the California miner and prospector is the desire to quickly realize on what he may discover. The rights of future generations, the requirements of manufactories yet to be established in the State, and the best interests of the State, are wholly ignored, in the selfish desire to get something for nothing, or to become rich without economy and labor. The same policy has caused enormous waste in the working of the rich ores of other metals in the State. The fact that half the mineral went to waste was no consideration, as long as the other half was immediately available. There being little or no competition, those having ores to sell must take what is offered or allow them to remain in the mines, which, by far the best policy, does not meet the views of our miners. According to the recent report of Dr. James Hector, of the Geological Survey of New Zealand, chromic iron containing fifty per cent of chromic oxide is worth from eleven to twenty pounds sterling per ton ($52 to $97.) This is from seven to twelve times the prices at which California chrome ores have been sold. Chrome iron imparts a green color to minerals and rocks with which it is associated. There is a variety of serpentine highly prized as an ornamental stone, known as "verd antique" (*vert antixqe*), oppiolite (*verde antico*) of the Italians and ancient Romans, which is a green serpentine, sometimes brecciated with strings of white steatite or noble serpentine veining it beautifully. It receives a high polish, but will not withstand the action of time. "*Verde di Prato*" is found in the Apennines, a few miles from Florence. It was largely used in the interior decoration of the Cathedral of Florence. "*Verde de Genova*" is found, as the name indicates, near Genoa. It contains veins of white and light green calc spar in green serpentine. These ornamental stones are again mentioned here in the hope that some prospector may search for and haply find a deposit of verd antique among the numerous localities of serpentine and chrome iron in California. The most of the chromic iron that has heretofore left the country has been sent, in the first instance, to San Francisco, and thence shipped around Cape Horn. More recently consignments are being made via the Isthmus, or overland by rail, small lots from the Placer county mines having gone forward during the past year by both of these routes.

THERE is a vast difference between prospectors. Among our acquaintances is an old time prospector who has made a dozen rich strikes and is the discoverer of several of our most productive mines, who to-day has not a dollar and walks the streets almost in rags. Then there is another 49er who never, to our knowledge, made an important discovery, and yet has accumulated a competence from little strikes and fortunate sales.—*Arizona Miner.*

Labor and Emigration.

One of the most notable economic problems of the day, and one in which both Europe and the United States are deeply interested, is the immense stream of emigration, which for many years has been setting westward across the Atlantic with increasing, rather than abating volume. When this movement first commenced it was made up chiefly of the peasantry and agricultural laborers of Europe. It is only within a few years past that skilled mechanics formed any considerable portion of that emigration. The receptivity of this country for the former class has been very great and is still comparatively so. Our vast regions of unoccupied lands presented a most tempting invitation to the poor, landless and crowded populations of Europe to come and take up land at a mere nominal or no cost whatever, and build up for themselves and children comfortable homes, with wide expanse of woodland, meadow and field.

It is thus that much of the very best bone and sinew of Europe has been transplanted to America. European countries at first regarded this exodus with much favor, especially as it relieved their overburdened centers of population of much undesirable presence, and to some extent of that of a decidedly dangerous character. Hordes of paupers, unthrifty and unclean—people of no good to themselves and of no benefit to the community which they left or to which they came, crowded themselves among the generally honest and desirable class of emigrants. As these latter began to come prominently to the front, our authorities enacted discriminating laws in regard to the character of the emigration which could be set down upon our shores, the effect of which was to greatly improve its character; and it soon began to number many business people and those of means as well. Next we find that the exodus included quite a large volume of skilled laborers, mechanics, artisans, etc. These we gladly received; but their departure began to cause friction at home. It was too desirable an element to part with. But its stoppage was not a thing to be readily accomplished.

And now, within a few of the later years this exodus has assumed a still more formidable aspect. During that time capital also began to move in this direction. Entire manufacturing establishments, whole plants, owners, men and machinery—all except the buildings themselves have taken up the line of march and have been settling down here and there in the United States, until now all the way from New England to Georgia may be seen at intervals flourishing establishments thus transplanted, and representing almost every branch of manufacturing industry in wool, cotton, silk and iron. The money value of this movement has already reached many millions of dollars, and is producing unmistakable friction—friction at both ends of the line. It is death to the old country; it is disturbance in the new. The reasons are obvious—too obvious at the European end to need remark.

In regard to this end of the column, the dominant policy here has been one of more or less protection to our industries. This policy has worked to the disadvantage of the European manufacturer. By reason of our tariff laws he cannot sell his home manufactured goods here, so he pulls up stakes and comes here to manufacture his goods on American soil. This looked all right at the start. Even now but few see any evil to flow from the movement. The argument is, that it is not in accordance with our policy or with the laws of reciprocity and humanity to restrict the movements of people from one country to another, when they are unobjectionable in character and go or come for worthy motives. But still the outcome of the movement works much hardship on this side of the Atlantic by reason of the larger influx of producers over consumers, by which we are getting into our communities an excess of skilled labor. The troubles growing out of this reach far out into the future. Labor, in its efforts to protect itself and keep down the growing surplus, is holding up its hands against the introduction of its own offspring into the shop. The number of apprentices which, under the rules of labor unions, may be employed in any shop is so small that an opportunity is presented for only a very small portion of the boys in our community to learn profitable trades, whereby they, in turn, may be able to gain support for themselves and future families. All this is being done too, while the doors are kept wide open for foreign skilled labor to come and go at its pleasure. In other words our laborers are being born, brought up through their days of consumption and non-production, in a foreign country and finally set down here, full-fledged, to enter our shops and take the place which by nature and right belongs to the boys, born and brought up here. We ought, above all things, to be able to produce our own skilled labor; and our public policy should be shaped to give us at least a reasonable advantage in that direction. The policy now in vogue, however, is in accordance with the principles of our Government and with our severed declaration of rights; but what of the outcome? Is there not danger of friction—friction which in the near future may produce sparks, that may lead to disastrous consequences.

There are thoughtful and observing men among us who see and fully appreciate the difficulties and danger of the situation—men who feel that something must be done, and that at once, to avert the threatened danger. There are only two ways out of the dilemma—we must either check the influx of foreign skilled labor, and the consequent reduction of the condition of the American laborer to that of the pauper labor of Europe, or provide a larger market for the products of the excess of that class of labor. The former is so averse to our settled convictions and organic principles that nothing but the actual presence of disaster could induce our people to accept it. The latter is open to no objection whatever, and, fortunately, is within our immediate reach. To some extent our national policy of protection, if carried a little further, may aid in the matter. A further aid may be found in educating our manufacturers and merchants more fully in the intricacies of foreign trade. This is now being done through the publication of our consular reports, and might be still further supplemented by the establishment of Commissions similar to the one at present in South America, if Congress only had the discretion and wisdom to make proper appointments, and thus render such Commissions purely business enterprises instead of junketing excursions. A further, and the one which we consider the most important of all, is the organization of

Proper Immigration Bureaus,

Especially throughout our Mississippi and farther western States. A few States have already entered earnestly upon this work, among which we may especially note California and Kansas. The object of these associations would be to encourage, by the dissemination of proper knowledge, the most desirable class of immigration, which as a general thing would be consumers instead of producers—that class of immigrants which will take up our public lands in small homesteads, or buy such as are improved, and build up thereon permanent homes. All such, naturally become consumers of the products of skilled labor, of which kind alone, we have a surplus. Such a class of immigration builds up the wealth and adds to the prosperity of a people far more rapidly than does the influx of skilled labor, so long as we are already fully supplied with that really needful element. That is the class of immigration that leads to the real advancement of the value of land legitimately produced by settlement and cultivation. There is nothing artificial in such values. They are legitimate and permanent, and that is the kind of value and the kind of population which makes a country great and powerful, and self-sustaining.

No Large Land-holdings Wanted.

There is another source of danger which this class of immigrants will tend to remove. It will lead to the eventual breaking up of the large land-holdings, which are always a drawback on any community. And this leads us to speak of a newly developed element of disturbance in this direction, which should be stamped out once in favor of the desirable class of immigration to which we are alluding—that is, the enormous movement of foreign capital for investment in the uncultivated lands of the great central portions of the country, mostly in the interest of cattle raising on an immense scale to the detriment of small cattle owners, and without any reasonable probability of leading to a reduction in the price of meat for the benefit of the consumer. The profits of such enterprises will inure solely to the benefit of foreign capitalists. The amount of money recently invested in that direction has been estimated at the enormous sum of $100,000,000, and is probably much more and constantly increasing. The amount involved, however, is immaterial in this connection. It is the principle which we most consider in the matter, and the effect which the policy will have upon the industries of the country. If this movement is allowed to go on unchecked and gather force and power, it will soon form a large factor in leading the country to a crisis of most tremendous import. But the space allowed to this article has already been exceeded, and we here close by simply referring to the self-evident fact that we need those lands and *must have them* to make homes for the millions of the earth cultivators which we now need to consume our leading cereal products and the diverse products of our skilled labor. By encouraging this important immigration movement we shall be able to avert the impending crisis for a time, at least until our people can recover themselves from the anomalous condition into which the great multiplication of modern machinery and the devious and questionable ways of modern capital seem to have most unexpectedly plunged them, and gain time to look around and properly adjust our national policy to the anomalous condition of things with which we are now so suddenly confronted.

THE Plymouth Consolidated Gold Mining Company of Amador, California, has declared its twenty-third consecutive dividend of 50 cents per share, payable in New York and San Francisco. This mine is making a splendid record and is doing much to call general attention to the fact that California gold mines, properly managed, can be made very profitable.

ROYALTY.—The Sutro Tunnel Company's receipts from royalty during the past year have amounted to $125,617.81, being an increase of $54,102.16 over the receipts of the previous year from that source.

MECHANICAL PROGRESS.

Something New in Steel.

Many of the changes wrought in iron and steel in the various processes of manufacture and use are almost magical in character. The subjoined, from the New York *Sun* records one of the latest of these changes.

Following the recent developments in the use of dynamite shells in common field cannons charged with powder is a new departure in the manufacture of cannon. It comes from the apparently endless variety of uses made of mild, or Bessemer process, steel, and is probably the most astonishing application yet made of that metal.

In 1880, about the time mild steel came largely into the market, the president of a company manufacturing seamless brass and copper pipe, concluded to try mild steel as a substitute in certain directions for the more expensive brass, copper and other metals used in his establishment. The process of manufacture was simple. A plate of metal was placed over a die and a mandrel forced the plate into it just as a lady might place a piece of tissue paper over her thimble and then force it in with her finger. The mandrel would force the metal into a shape like a deep bowl, with sides of uniform thickness. By repeating this process with other dies and mandrels, hydraulic presses being used to shove the mandrel through the die, the plate of steel eventually became a steel tube of uniform thickness and perfect bore and circumference. The steel was found to work as easily as the brass or copper, and no change of tools was necessary.

As steel was cheaper than copper, the advantage of substituting drawn steel seamless tubes for brass or copper ones was manifest. But the saving in price was altogether the smallest gain. To the astonishment of those engaged in the experiment, the steel was found to have radically changed its character in the process. It went into the machine soft and pliable. It came out, although drawn cold, a beautifully tempered spring. If a tube was compressed, it would instantly resume its shape when the pressure was removed. If struck with a hammer it rang like a bell, while tests of the increased strength of the metal showed a change that was wonderful. To fully test its strength a boiler of the size and style used beside every range in New York flats was made from the steel by this process. The metal of the boiler was drawn out to the thickness of about one-thirtieth of an inch, and then it stood a pressure of 600 pounds to the square inch, giving way when that limit was passed.

After this and other tests the experimenters began to wonder why a gun barrel could not be made of steel by this process that would be superior to any other. They first made a tube of six inches bore and half an inch thickness of metal. This was drawn cold. Then another was made of the same thickness of metal, and of a bore that would permit it to be shoved over the first one by the hydraulic press when it was warmed, the first remaining cold. A third was then drawn over the two, and thus was completed a cannon. It was found that it would stand a water pressure of 75,000 pounds to the square inch. This cannon has been sent to Sandy Hook, and the officers of the artillery corps will try to burst it by the usual tests applied to new cannon. They have before them the astonishing spectacle of a gun that will throw a solid shot weighing 100 pounds, although the metal is only one inch and a half thick around the powder. To people accustomed to seeing the common cannon, enormously thick at the breach, it will seem incredible that an inch and a half of this metal will serve the purpose better.

It is well-known that one cause of the high price of illuminating gas to the consumer is the great quantity lost by leakage through the cast-iron pipes used. In Pittsburg it was found that this leakage of the natural gas was so great that serious and fatal explosions occurred. Every foot of the cast-iron mains there has in consequence been ordered out. The great size of the bore needed prevented the use of lap-welded wrought-iron pipe, and the seamless pipe of paper thickness will be used, its great density being proof against any leakage of gas or liquid under any pressure. The tendency to corrode even under ground is very small, but this objection to steel will be wholly obviated by coatings either of tin or aluminium bronze within and without. The steel pipe is not only better, but cheaper.

Milk cans are being made of the new steel tubing. The bottom is an eighth of an inch thick, and the sides about one-fourth of an inch. The banging of the most vigorous Yankee cheese-maker or of the most reckless brakeman on a milk train cannot dent them or seriously injure them.

The experimenters have also turned their attention to clock springs, and they have found that the new process not only makes a cheaper, but a superior quality of spring. Just what change the metal undergoes in this process of drawing has not been determined. That it becomes fibrous is plain. Iron drawn out into wire becomes fibrous also, but it does not become a tempered spring.

CAST-IRON COLUMNS AS MAIN SUPPORTS.—The employment of cast iron columns as main supports has been greatly restricted at Berlin by a regulation issued from the architects' department of the police authorities of that city. The order has been issued in consequence of a discovery made last winter at a fire, when it was found that the cast-iron columns had been cracked by the effect of the cold water playing on them while hot. The authorities now insist that where partition walls rest upon cast-iron columns the latter are to be covered with plaster or bricked in, with an air space between the bricks and the column.

Fiber in Nails.

Unless cut nails are made from better material than is used generally now, their place in the market will be usurped by nails made from fibrous material. Wire nails are very favorably regarded, and are used in preference to cut nails on account of their superior tenacity, notwithstanding superior cost. The iron for cut nails, after being rolled, is slitted or cut lengthwise to a width adapted to the length of the nail to be cut. The length of the nails so cut is directly across the fiber which the iron has acquired by rolling, and, of course, shows its weakest where it should be the strongest. The ordinary cut nails will not drive into seasoned hard wood without "crippling," even under direct blows, and when the blow of the hammer is slightly on one side, they snap like clay pipe stems—they have no tenacity. The weakness of these nails is shown by the fact that it is almost impossible to straighten one that has been drawn from the wood, and then drive it again; in many or most instances, the nail will break in drawing.

On the contrary, the wire nails may be crooked into corkscrews, and then be straightened and be re-driven. They are not only tough, but they are stiff, and will penetrate hard wood where the cut nail would break sharply off or hopelessly crook beyond restraightening. In every respect the fibrous nail is better than the crosscut nail. If it could be afforded at the same or approximate price, it would take the place of the ordinary cut nail.—*Manufacturer and Builder.*

BESSEMER STEEL FOR ENGINEERS' TOOLS.—How nearly Bessemer steel can be brought to crucible in its usefulness for tools is a matter than which there are few more important to the machinery engineer. The advance of the Bessemer metal in this respect means to him a considerable saving of money. It may not, perhaps, be generally known that Bessemer steel is now used for a very great variety of purposes, for which, until recently, crucible steel was thought to be a necessity. Bessemer steel, besides its use for heavy work, is now wrought into roll-turning and lathe-turning tools, chisels, files, shear blades, rail drills, rail punches, shear steel for welding to iron, miners' drills and tools, picks, shovels, hand hammers, roller bar and cotton spindles, locomotive engine, wagon, carriage, coach and furniture springs, bolts, nuts, rivets, pit ropes, telegraph, crinoline and corset wire, umbrella frames, wire for musical instruments, and the like. Nor has cutlery itself been found too hard a test; for this special steel has been made even into razors with decidedly good results.

A MISTAKE WHICH IS FREQUENTLY MADE IN SETTING BOILERS.—A mistake which is frequently made in setting boilers, says the *Locomotive*, consists in loading them down on top with a great mass of brick-work, which often does more harm than good. Of course some good non conducting covering is necessary if we wish to attain a high degree of economy, but for boilers some of the lighter coverings are much to be preferred to brick. This is especially true in the case of long cylinder boilers, of small or comparatively small diameter. It is no unusual thing to find boilers of this type with several tons of brick and mortar piled on top, which load the boiler has to carry, in addition to its own weight, on two supports, perhaps at the extreme ends. In such cases the girth seams generally show distress near the center of the shell where the greatest strain comes. What is needed is some good light coverings, made in sections so that it can be easily removed without destroying it, for purposes of inspection, and as easily replaced.

PROGRESS IN CANNON MANUFACTURE.—Scarcely twenty five years ago the most powerful piece of artillery was a sixty-eight pounder, throwing its projectile with a velocity of 1,600 feet per second. Now the weights of guns have been increased from five to 100 tons, the velocities from 1,600 to 20,000 feet per second, the energies from 1,000 foot-tons to over 52,000, and the projections from 68 pounds to 2,000 pounds.

LAGGING IRON PULLEYS.—Cast iron pulleys may be lagged or faced with leather without the use of rivets, in the following manner: First brush over the face of the pulley with acetic acid, which will in a short time rust it and give it a very tough surface; then attach the leather to the face of the pulley with a cement composed of one pound of fish glue and one-half pound of common glue, cooked in alcohol and water.

PISTON RINGS should be turned inside as well as outside, so that they will not spring out of true when they are split. The time required to turn them inside is not one-tenth part of that required to turn them in the vise, if they warp in being split.

SCIENTIFIC PROGRESS.

Fallacy of the Present Theory of Sound.

To attack a theory which has been upheld for 2,500 years, and which is sustained by the greatest living scientists, is certainly a very bold undertaking. Prof. Henry A. Mott, Jr., E. M., Ph. D., of the New York College of Medicine for Women, comes to the fore and asserts that the commonly received undulatory theory of sound is false and does not account for many phenomena. Quoting from Prof. Huxley he says:

"Every hypothesis is bound to explain, or at any rate not to be inconsistent with, the whole of the facts it professes to account for; and if there is a single one of these facts which can be shown to be inconsistent with the hypothesis, such hypothesis falls to the ground—it is worth nothing." Dr. Mott takes up one or two phenomena in detail, and attempts to prove the fallacy of the present theory to account for them. Tyndall says: "When a common pendulum oscillates it tends to form a condensation in front and a rarefaction behind. But it is only a *tendency*; the motion is so slow, and the air is so elastic, that it moves away in front before it is sensibly condensed, and fills the space behind before it can become sensibly dilated. Hence waves or pulses are not generated by the pendulum." This is admitted by one of the highest authority on the current system of acoustics.

Mr. Mott gives some very interesting figures in regard to the sounds produced by the common locust. This insect weighs less than a quarter of a pennyweight, and can, by simply rasping its legs across the nervures of its wings (for this is the way its tone is produced), according to the wave theory, create a physical agitation and displacement of the air which converts four cubic miles of atmosphere into waves consisting of condensations and rarefactions. In these four square miles there are 16,000,000,000 square-inch columns of air, each exerting a pressure of 15 pounds in all directions—in the aggregate, 120,000,000 tons. Now since sound can only travel by means of air waves, consisting of condensations and rarefactions, it follows, if this theory be true, that this insect, by simply moving his legs, displaces all the particles of air constituting these 16,000,000,000 square-inch columns for a mile high, and restores them to their places again 440 times each second (its tone being very nearly A), and continues this process of thus charming the atmosphere for a full minute at a time.

When we apply the power exercised by the locust (that could not move an ounce of weight) to the membrana tympani of the human ear, we obtain still more interesting information. It is agreed by all scientists that if an ear were present in any part of the four cubic miles of air, the sound of the locust could be heard and the membrana tympani would bend once in and once out for each vibration, or 440 times in one second. The inertia to be overcome in doing this has been determined to be half a grain for each membrane. By a simple calculation it has been found that there is room enough in this area for 65,000,000,000,000,000 of these membranes, which would give a ponderable mass of 4,000,000,000,000 pounds which this small insect is able to throw into rapid vibration!

Another case is given. Imagine a locust stridulating in the center of a mass of iron one mile square. It is admitted that he could be heard, and about sixteen times quicker than in the air, by placing the tympanic membrane in actual contact with the iron. Now since a mass of iron is all thrown into wave motion whose amplitude will vary from 1-500 to 1-1,000 of an inch the iron must be moved at least to this extent, which can be proved by experiment. The mass of iron thus displaced would weigh not less than 720,749,040,612 tons! According to Dr. St. John Rossa "the presence of the membrane tympani, in whole or in part, is not necessary to fair hearing." Therefore the beautiful idea of the tympanic membrane vibrating once in and once out for each vibration and being hit harder to produce intense notes seems unfounded—the real use of it being to keep cold and dust out of the middle ear which might otherwise become inflamed or diseased.

A correspondent of a New York paper from which we clip the above says: Some of Professor Mott's deductions and proofs certainly seem very fatal to the undulatory theory of sound, but while he pulls down the theory it is perhaps a little unfortunate that he does not offer another in its stead. This, however, he proposes to do at some future date.

Although the wave theory of sound does not at present seem to account for some phenomena observed, yet it is certainly best to adhere to this old theory until another and better one which can explain all the phenomena of sound is put forth.

ACQUISITION IN INFANTS.—A correspondent of *Science* furnishes the following in regard to the power of infants in acquiring knowledge: "I recently tried teaching a 12-months-old baby to ring a common dome table-bell. Perceiving the little knob on top to be somehow concerned she fingered it clumsily, but could not learn to strike down on it accurately with her raised hand, though I forced her to do so many times. She made clumsy motions, but finally, half accidentally, she rang it. This was enough. She at once rang it repeatedly with great success. I took it away to test her memory, and the next morning she rang it immediately without suggestion, but had it for a moment only. She was then absent four days; on returning, she rang it at once."

LACQUER WARE.—A Japanese describes the lacquer process: The art of lacquering is distinctly Japanese in its origin, and it is already more than 1200 years old. The pieces made in those olden times are still extant. The raw lacquer, chiefly the *Sechime urushi*, is used for priming, with an addition of burnt clay dust, or fine stone powder, so as to produce a coating of utmost hardness. The prepared lacquer, after having been strained, is lightly transparent when applied in thin layers, and possesses a color similar to that of shellac; this transparency is occasionally increased by a small addition of drying-oil, which, by mere hardening, produces a sufficient glossiness of the surface, whereas the pure lacquer is mixed with cinnabar or pigment, red oxide of iron or Prussian blue, etc.

The black lacquer is prepared in the following manner: It is effected without any addition of solid particles, such as lampblack, or similar substances, but merely by stirring the crude lacquer for a day or two in the open air, whereupon it assumes a very dark brown color. Toward the end of the operation a small quantity of water which has been kept standing for a few days, mingled with iron filings or a gall-nut infusion, darkened by the addition of iron, is added, and the whole stirred again, until part of the water has evaporated; then the lacquer acquires more consistency. The addition of this water is said to cause the highest brilliancy and blackness of lacquer. Sometimes the colored lacquer is used when the final coating is required to be of transparent nature. Either the unmixed strained lacquer or that peculiar kind of lacquer which has been thinned by an addition of oil is used. The mixing of lacquer with hardening or coloring powders is generally effected by the lacquerer himself on a wooden board with a wooden spatula just before using it. Finally the thick moisture is forcibly strained through a piece of paper called yoshinogami. Should the lacquer become too stiff for use, some bits of camphor are crushed and thoroughly mixed with the lacquer by spatula, and then it becomes more liquid.

COMETS AND ASTEROIDS.—The year 1884 did not present a record of very numerous or brilliant additions to the cometary family. There were six comets which have some claim to a place on the list, although there are but two that can be definitely classed as new. The third of the series to put in an appearance was perhaps the most important—not for its size or brilliancy, however. It was a mere speck of a comet, but has proved to be a celestial rover of considerable interest. A study of its history and movements shows that in 1875 it ventured quite near the great planet Jupiter, by whose attraction it was forced out of its regular orbit and made to move in one quite new. This is not the first time a charge of this kind has been made against Jupiter. It has, in fact, quite earned the reputation which has already been given to it, as "the great comet disturber" of our solar system. The newly discovered asteroids of 1884 number nine, which increases the fall number of this prolific and anomalous class of celestial bodies to the total of 244. Of these, six were discovered by Palisa, of Venice; one by Knorre, of Berlin; one by Borelby, of Marseilles, and the other by Dr. Luther, of Duseldorf.

GIGANTIC CRYSTALS.—America has long been celebrated among mineralogists as the home of enormous crystals, and the prodigious individuals of apatite, beryl and other minerals, found have been the subject of wonderment. But for size, the crystals of spodumene exposed in the excavations upon the Etta tin mine, in Pennington county, Dakota, carry off the palm. Prof. Blake, reporting on the subject, is authority for the statement that one of these crystals is *36 feet in length* in a straight line, and from *one to three feet in thickness*. The cleavage is smooth and straight, but the lateral and terminal planes are obscure. Crystals from 5 to 20 feet long are numerous, and recline in all directions.

THE CATARACTS OF THE NILE are due to granite veins, which the river, while working a way through the sandstone, had been unable to destroy or remove. A little modern engineering and by dynamite would probably add 1,500 miles to the uninterrupted navigation of that river, and open up northern-central Africa to the direct commerce of the world, as the Congo will eventually open up the southern-central portion of that continent.

VASELINE is said to be a good preservative for eggs. The vaseline is melted with three per cent of salicylic acid and rubbed on the eggs after they are thoroughly washed. The coating so given may be renewed after awhile. As the air is thus thoroughly excluded, the eggs, if they are fresh to begin with, ought to keep good for a long time.

MAGNESIUM BY ELECTROLYSIS.—A large lump of magnesium has been shown by Dr. Frohich to the Berlin Physical Society as the product of an electrolytic industry, the process of which is based essentially on the melting of chloride of magnesium and decomposing it in the melted state by an electric current.

TABLE OF CONTENTS.

EDITORIALS.—The Hesse Water Meter, 249. Passing Events; Retorting Gold Amalgam; British Columbia Quartz; Matte Roasting; Coal Trade of the United States, 252. A Combined Vacuum Pump and Table Blow-pipe; Product of English Mines; Nova Scotia Mines, 253.
ILLUSTRATIONS.—The Hesse Water Meter, 249. Combined Vacuum Pump and Table Blow-pipe, 253.
CORRESPONDENCE.—Forest City Gold Mines, 250.
MECHANICAL PROGRESS.—Something New in Steel; Cast Iron Columns as Main Supporters; Fiber in Nails; Bessemer Steel for Engineers' Tools; A Mistake Which is Frequently Made in Setting Boilers; Progress in Cannon Manufacture; Lagging Iron Pulleys, 251.
SCIENTIFIC PROGRESS.—Fallacy of the Present Theory of Sound; Acquisition in Infants; Lacquer Ware; Comets and Asteriods; Gigantic Crystals; Magnesium by Electrolysis, 251.
USEFUL INFORMATION.—Imitations of Leather; Spiders and their Peculiarities: A Peculiar Wheat Test; Sound Advice; Oil-Stone Powder for Grinding Purposes; Nails in a Pound; Plating Small Pieces with Brass; The First Shipment of Cotton, 255.
GOOD HEALTH.—Cancer, Malaria and Consumption; Cramps; Beware How You Drink; Work in Hot Places; Canned Food, 255.
MISCELLANEOUS. — California Chrome Ores; Labor and Emigration, 250. Combined Amalgamation and Concentration of Silver Ores; Hours of Labor; Mine Leasing; Idaho's Mining Districts, 254. Disturbances in Trade and Industry; How to Retain Good Workmen, 255.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon and Utah, 256-257.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 260.

Passing Events.

Public interest has been centered on the movements of the English and Russian shipments, with reference to the probability of war being declared. Preparations are being made by both powers, but no active steps have been taken.

The winter is about over and many mines are being started up that have been closed down. Moreover, the weather is such that the prospectors can again take the field.

In California more particular attention is being paid to the Northern counties, and Trinity, Sierra and Siskiyou will show up some good mines this season it is expected. No special news of interest comes from the New River mines. Roads and trails are being built, and many men are going in a lot and startliog developments have so far occurred. It is rather too early, however, for very much to be done.

MARIPOSA county has a mine, not on the Fremont Grant, which is reported as being a genuine honanza. It is the Deltz mine, which has long been worked. Lately, however, they have been working a decomposed streak of matter which lies on the footwall, and are workiog up the specimen stuff in hand mortars. We were shown some of this material this week. It carries very coarse gold. Some of the lighter portions can be washed, but part of it must be crushed in mortars. The specimens are very rich, and it is intended to have a mill to work the whole mass. A great deal of gold is now being taken out by hand mortars. The new discovery is iodependent of the main lode.

Retorting Gold Amalgam.

Ordinary iron retorts down to a very small size may be purchased of the dealers as assayers' material. These retorts, for small operations, are deep, cast-iron vessels with the top edge planed level, on which fits a cover also planed true so as to form a perfect joint. A tube opeos through the cover and bends downward. The cover is fastened by a clamp and set-screw. The amalgam is put into the retort and a luting made of a mixtnre of wood-ashes, clay and water is put thickly around the edge of the cover to stop any possible leaks. The retort is placed in a furnace over a modcrate fire, and the end of the pipe placed under the surface of water in a basin, pan or other convenient receptacle. If the fire is kept under proper control there is no need of covering the pipe, though it is often kept cool by being covered with cloth or a bag and water poured upon it.

When the amalgam bas been imperfectly cleaned the gold will sometimes stick to the retort, but this may be obviated by chalking the interior of the retort or putting a piece of common writing-paper under the amalgam balls. However, when the amalgam is clean and has been thoroughly worked over the gold will come out easily.

The State Mineralogist states that a very convenient way to retort is to drive two small stakes into the ground, and to fasten a small iron rod to each at a convenient hight; upon this the retort is hung and a fire of small wood is built around it. When the retort has attained a dull red beat and no more mercury distills over, the fire is put out and the retort allowed to cool; the cover is taken off and bullion removed. If the amalgam has been properly cleaned the gold will be found after retorting to be metallic in appearauce and of a gold color. It is ready for the smeltiug-pot a s soon as taken out.

It is never safe to open the retort before the gold is out, nor will it stand being cooled in water. Openiog a hot retort and inhaling mercurial fumes may give a man a good idea of an important run a little sooner, but no one will do it often. We are speaking of retor ing ou a small scale, and not in regularly built retort furnaces. Sometimes men try to clean improperly retorted amalgam with acids. Miners will occasionally wash amalgam as taken from the bags, first in diluted sulphuric acid and then with nitric acid, supposed to be pure, which is a treatment only the ignorant will give it. It is better to properly clean the amalgam and to flux off any accidental impurity on the crucible.

When there is iron in the amalgam and the latter is not properly cleaned before retorting, the bullion comes out black. When amalgamation is carried on in iron pans the iron will often enter the amalgam. It seems the iron does not come from the ore, but from shoes and dies of the pans. This iron amalgam seems only found in roasted silver ores and raw gold ores. It is very magnetic and the iron only loosely combined with the quicksilver, so that simple mechanical treatment, such as rubbing or grinding, is enough to separate the iron from the quicksilver, but this is too slow for practical work.

It may be stated that there are several different ways of treating this iron amalgam, but that described by the late Mr. G. Kustel is quick, cheap and perfect, and is as follows: A flat-bottomed pan like Knox's is put in motion without any water in it and a bucketful of sifted ashes introduced. The well-strained amalgam is then thrown in gradually, piece by piece, in proportion as it turns into powder. If the mixture assumes a dark color, or if the pulverization commences to go slow, another bucketful of ashes is added, and so on until about 300 pounds are pulverized, which is effected in about half an hour. The gray, heavy powder is then taken out and another lot of 300 pounds of amalgam managed in the same way, and so on. In case the ashes are moist a reaction in the mass is observed by the increase of temperature to a considerable degree. After the mixture is finished the powder is allowed to lay for an hour undisturbed, then some water admitted into the pan so as to cover the bottom about an inch deep. While the muller is in motion the amalgam powder is introduced by means of a scoop until about 300 pounds are charged. Water is added, if necessary, but not too much. Quicksilver is generally not required unless the amalgam was strained very hard. After a while the amalgam becomes more liquid by losing the iron, which blackens the water. After an hour's grinding some amalgam is taken ont and examined, and if not quite clean another hour will do. A quarter of au hour before the discharge more water and quicksilver is added—the quicksilver only for the purpose of easier discharge. It is not exactly necessary to work with charges of 300 pounds.

If the supposition is correct that the iron comes from the shoes and dies of the pan, then if a certain kind of ore is inclined to form iron amalgam this could he preveoted by omitting the grinding; but in treating raw gold ore the grinding is indispensable, and in this case if iron amalgam is formed an addition of ashes to the ore would probably keep the iron from entering the amalgam, as the ashes are the means of separating it. Treating silver ores, this last remedy could not be used for the same purpose, as too much of it would injure the amalgamation.

British Columbia Quartz.

We had a conversation this week with a gentleman who has been a resident of British Columbia for some years, and whose occupation as a surveyor has given him an opportunity to go over a good deal of the region. He states generally that most of the country is rugged and mountainous and is fit only for stock ranges, timbering and mining. Of the latter occupation very little is being done, as there are very few mining men there, and it seems difficult to get any one to take an interest in quartz mining, there being a general lack of enterprise. Just now the building of the Canadian Pacific is making matters a little brisk in certain portions of the region.

Our informant says that there seems to be plenty of ledges in the mountains, though very few of them have been prospected to any extent. The country is difficult to prospect in, on account of the dense growth of timber and the many streams. Moreover, when the beaten trails are left the prospectors have to cut trails for themselves through the timber and undergrowth.

We are told of the existence of a large ledge of quartz about twenty feet wide, and the croppings of which extend several miles. This mass of quartz runs down to the water's edge of an inlet, where it is deep enough for large ships to come. The quartz is filled with sulphurets, and by the help of concentrators it is thought it would pay well to concentrate and ship to this port for treatment.

The gentleman to whom we refer speaks also of a gold mine on Cherry creek, 60 miles from the boundary line and 40 miles from a railroad station, upon which a small shaft has been sunk and some very rich ore taken, yielding several thousand dollars. But when the vein pinched down thin it was abandoned. The ledges appear to be "pockety," and when a pocket gives out they are afraid to spend time or money in looking for another. He has tried to get parties to open the mine properly and see if the old class of ore cannot again be struck.

Some men are prospecting a claim on Burns mountain, Carboo, and a Colorado miner has found a ledge on Rock creek, at the headwaters of Kettle river, which runs into the Columbia below old Fort Caldwell. Little work has been done on either of these claims.

Our informant thinks there is a good field for prospecting, provided the men are suitably prepared. He says men want $500 or $600 each when they arrive in the country, and he is sure experienced men could find the ledges. Food is cheap, but at present there seems neither energy or capital in the country to he applied to mining. He thinks a man could live as miners do for $250 for a year. The mining laws have been simplified of late. When a ledge is found it is recorded at an expense of $2.50. This holds it for 30 days. The prospector may then pay $50 in cash and get a clear title to his claim of 1,500 feet by 600, and there is no distinction as to nationality of the miner. Or, if a man expends $1,000 in development he can, on proper proof, then get a title from the government by payment of $2.50 per acre.

SEVEN tunnels have been successfully run into the mountains in Los Angeles county, and water obtained for irrigation purposes.

Matte Roasting.

In working lead ores, whenever there is any sulphur in a smelting mixture it has to be alurated with the necessary quantity of iron to form a matte of the right composition. To extract the lead and silver which these mattes retain, it is necessary to roast or calcine, and afterwards flux and smelt them exactly in the same manner as ore. If they are so poor in lead that there is danger of its being entangled in the slag and thus lost, it is advisable to add plumbiferous ores or products in sufficient quantity to effect a complete separation of lead and slag in the furnace. A charge containing 10 per cent of lead will be safe to answer this purpose, yet it is possible to obtain the same result with as little as six per cent. The question now arises, will it pay to roast matte as a reverberatory, as it costs something to reduce it to powder besides the roasting itself? In the opinion of Mr. O. H. Hahn, a writer on this subject, if the matte is rich in silver it does; if not, then it requires close figuring of all expenses. The same authority, in speaking of roasting poor matte in heaps, says the only preparations needed were coarse crushing, a bedding of wood to pile it on, and setting it on fire. The crushing is easy enough after it has been exposed for a while to atmospheric influences, which cause it to crumble.

But the calcination is extremely tedious, as it will burn a month or more and then the whole pile will have to be turned over to assort the well-calcined stuff from a half-calcined and crude matte, from which a new pile or heap has to be formed. These manipulations have to be repeated till no more crude matte is left, and it will take months before that result is achieved. However well this matte may be roasted in heaps, it will always contaio from 7 to 8 per cent of sulphur, which in the following smelting operations will cause another matte to be formed. Mr. Hahn concludes that this mode of roasting is not worthy of imitation in a progressive country where time is an object, and most smelters take the same view. They are simply laying aside the poor mattes for a time when these may be reduced more cheaply and quickly than at present. Attempts to roast ore in this manner have been frequently made, but just as often discarded as tedious and imperfect. An ore which does not hear roastiog in a furnace should be left alone.

Coal Trade of the United States.

Although the general business of the country was in a depressed condition last year, the returns show an increase in 1884 of the coal production of the United States. J. E. Saward, of New York, has issued his usual "Local Trade" this year, which contains detailed statistics for all States and Territories for the year 1885 compiled from authentic sources. A recapitulation of the production of coal for the last two years is to he found in the following table:

States.	Tons, 1883.	Tons, 1884.
Alabama	1,400,000	2,000,000
Arkansas	75,000	150,000
California	200,000	200,000
Colorado	1,000,000	1,500,000
Dakota	50,000	50,000
Georgia	200,000	200,000
Idaho	10,000	20,000
Illinois	10,508,791	10,101,005
Indiana	2,560,000	2,260,000
Indian Territory	175,000	400,000
Iowa	3,881,350	3,903,458
Kansas	850,000	1,100,000
Kentucky	1,650,000	1,550,000
Maryland	2,206,172	2,269,051
Michigan	135,000	135,000
Missouri	2,250,000	2,500,000
Montana	50,000	50,000
New Mexico	250,000	350,000
Ohio	8,229,529	9,000,000
Oregon	60,000	60,000
Pennsylvania Anthracite	31,703,027	30,718,293
" Bituminous	24,000,000	25,000,000
Tennessee	1,000,000	1,200,000
Texas	100,000	125,000
Utah	250,000	250,000
Virginia	225,000	300,000
Washington Territory	260,000	200,000
West Virginia	2,805,565	2,300,000
Wyoming Territory	700,000	1,000,000
Totals	96,875,384	99,651,807

In these statistics California cuts a comparatively small figure, and even then we are of the opinion that Mr. Saward's estimate is altogether too high. The only productive mines in the State last year were the Mt. Diablo and the Ione mines. The Ione product is a lignite mainly used by local consumers, and very little of it finds its way to San Francisco. The Mt. Diablo mines only sent to San Francisco in 1884, according to Mr. Saward's and our figures, 77,485 tons, though there was, of course, local consumption and some supplied to river steamers. But it is not probable that the whole product was over 100,000 tons. Our main dependence on this coast is on the Oregon and Washington Territory coals, and those from Great Britain and Australia, which come in the wheat ships.

A Combined Vacuum Pump and Table Blow-pipe.

The apparatus here described was designed by W. F. Durfee, of Bridgeport, Conn., for use in the laboratory of the American Silver Steel Works. Mr. Durfee described the apparatus in a paper read before the American Institute of Mining Engineers. In the drawings Fig. 1 is a general elevation of the apparatus, the air-chamber being sectioned vertically; Fig. 2 a plan of the air-chamber; Fig. 3 a vertical sectional elevation of the vacuum pump, the section being on line C D, of Fig. 4, which is a horizontal section of line A B, of Fig. 3.

The vacuum pump is constructed of copper, and consists of a vacuum chamber, E, supported upon the upper expanded end of a vertical pipe, Q. The vacuum chamber is provided with four nozzles, C, F, I, D (Fig. 4), two of which are shown in section at A, B (Fig. 3).

Passing vertically through the center of vacuum chamber E is seen the water supply pipe P, whose lower extremity encloses an internal pipe p, which is supported and placed in communication with the vacuum chamber E by means of the two elliptical nozzles, n, n. The upper part of the pipe p is closed by a conical cap, and its lower end is in the same plane with the extremity of the water supply pipe P, within which it is placed.

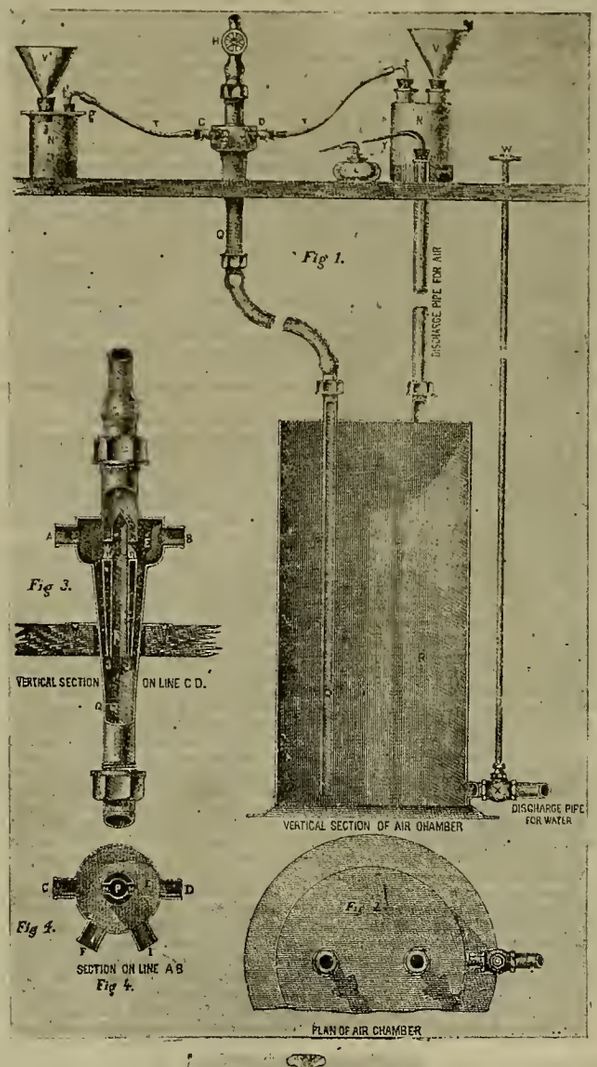
The relative sizes of the pipes P and p are such that an annular adjutage, one-sixteenth of an inch in thickness, is formed between their lower extremities, through which the water from the supply pipe P passes into the pipe Q, drawing any air that may be in the vacuum chamber E and the upper conical part of the pipe Q along with it, the air in the vacuum chamber E having free access to the interior of the hollow cylindrical jet through the nozzle n, n, and the internal pipe p.

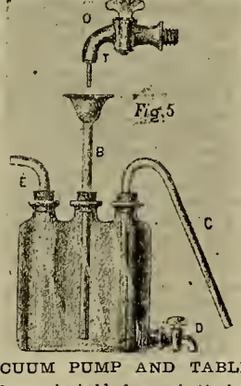
When the apparatus is used to facilitate the operation of filtering, either or all of the nozzles C, F, I, D, are connected by rubber tubes to the vessel which is to receive the filtrate. In Fig. 1 two kinds of receiving vessels are shown. That on the right consists of a common two-necked bottle, N, to whose right-hand neck is fitted a cork through which is passed the stem of a glass funnel V, containing the filter paper and the solution to be filtered; the left-hand neck is provided with a cork through which is passed the lower end of a bent glass tube, t, to whose outer extremity is attached the right-hand end of the rubber tube T, the other end being connected by a short glass tube to a perforated cork adapted to the nozzle D of the vacuum pump. The form of receiving apparatus shown on the left of Fig. 1, consists of a beaker, N, of common form, having its lip ground to an air-tight contact with a glass cover-plate, g, provided with two holes to which are fitted corks for the reception of the filter-funnel V', and the bent glass tube t', which last is connected to the nozzle C of the vacuum pump by the rubber tube T'. Whenever the apparatus is employed as a vacuum pump, such of the nozzles C, F, I, D (Fig. 1) as are not connected with the filtrate-receivers must be closed with cork stoppers, as are the nozzles F, I; the cork stopper in the upper end of the discharge-pipe for air must be removed, and the valve X, in the discharge pipe for water must be kept wide open. The adjustment of the apparatus allows the mixture of air and water, which is discharged from the vacuum pump through the pipe Q into the air-chamber R, to separate and pass away without resistance through the respective discharge-pipes for air and water. The rapidity and power of the action of the vacuum pump may be readily adjusted at will by means of the valve H (Fig. 1), which controls the amount of water admitted to it in a unit of time.

Having thus described the action of the apparatus when used to hasten the process of filtering, attention is now called to its use as a means of furnishing blast to a table blow-pipe.

In Fig. 1, the apparatus is represented (for the purpose of compactness of illustration) as acting, at the same time, as an exhauster and compresser of air, though in practice it is never used in this way. When it is desired to use it for the latter purpose, it is adjusted as follows:

The cork stoppers are removed from each of the nozzles C, F, I, D, thus allowing the air free access to the vacuum-chamber E (Figs. 3 and 4); the valve X, in the discharge pipe for water is partly closed, and a cork having a bent, tapered glass tube Y (Fig. 1), to serve as a blow-pipe tuyere, adapted to it, is inserted in the upper end of the discharge pipe for air. This tuyere pipe Y can be adjusted vertically, by moving it up or down in the cork through which it tightly passes, so as to adapt it to the hight of the blow-pipe lamp L. In case it is necessary to use the blast at a distance from the upper end of the discharge-pipe for air, one end of a rubber tube of any convenient length may be attached to this pipe, its other end being provided with a tuyere, which may be held in any suitable support, and thus the blast may be carried to any form of lamp or other heat-generator.





COMBINED VACUUM PUMP AND TABLE BLOW-PIPE.

The apparatus being adjusted as described, all that is required to put the blast in action is to turn on the water to the vacuum pump by means of the hand-wheel H (Fig. 1). The water, as it passes through the hollow cylindrical adjutage j j (Fig. 3), draws the air through the four open nozzles C, F, I, D, and carries it through the pipe Q (Fig. 1) into the air-chamber R, in which the air and water separate, the former finding an escape through the discharge-pipe for air and its attached tuyere, and the latter passing off through the discharge pipe for water. It is desirable that the air-chamber R should be located ten or twelve feet below the point of discharge of the blast, whose intensity is influenced to a great degree by the distance from the vacuum-chamber to the bottom of the air-chamber, as also by the pressure of the water supply through the valve H. The volume of blast may be regulated within its maximum limit by means of the valve H, and its pressure within the same limit by properly adjusting the valve X by means of the hand-wheel W.

Another form of blow-pipe apparatus, dependent for its action on similar principles to that already described, is illustrated by Fig. 5. It was first constructed by me in the year 1863, for use in the laboratory of the Steel Works at Wyandotte, Mich. It has the advantage that it can be readily arranged with the means usually at hand in any well-regulated laboratory. It consists of an ordinary Woolf bottle, A (Fig. 5), to whose central neck is tightly fitted (by means of a cork through which it passes) a funnel-tube, B, extending nearly to the bottom of the bottle. To the right-hand neck is fitted, in a similar way, a syphon, C, whose inner end nearly touches the bottom of the bottle. (In case a two-necked bottle having a tubulation on one side is available, a small cock, as shown in dotted lines at D, may be substituted for this syphon.) The left-hand neck of the bottle A has adapted to its cork a curved pipe E, to which may be attached a rubber tube for conveying the air delivered by it in any desired direction, for use in a blow-pipe or other apparatus. When it is desired to put the apparatus described in action, it is placed under a hydrant cock, O, which is provided with a glass tube, T, slightly smaller in diameter than the funnel-tube B, and through the tube T a regulated stream of water is discharged into the funnel-tube. This stream will draw down with it into the bottle A a large volume of air, which, separating from the water is discharged through the pipe E, while the water finds its escape either through the syphon C or the cock D, as the one or the other is used in the construction of the apparatus.

Product of English Mines.

Official statistics show that the weight of mineral produced in Great Britain last year was 174,148,319 tons, a reduction of about four and a half millions of tons from the preceding year. An abstract of the statistics shows the following results:

	1883. Tons.	1884. Tons.
Coal Mines Regulation Act.		
Minerals raised.		
Coal	163,737,327	160,044,175
Fireclay	2,189,452	2,046,567
Ironstone	11,495,401	10,408,467
Shale and other minerals	1,341,210	1,648,610
Totals	178,763,390	174,147,819
Number of persons employed	514,933	517,623
" fatal accidents	921	863
" deaths occasioned thereby	1,054	942
Metalliferous Mines Regulation Act.		
Number of persons employed	50,235	44,120
" fatal accidents	68	54
" deaths occasioned thereby	86	56

Although the amount has fallen off by upwards of four and a half million tons, the number of persons employed has increased from 514,933 in 1883 to 517,623 in 1884. On the other hand, fatal accidents and the deaths caused thereby have both diminished, the accidents from 921 to 863, the deaths from 1,054 to 942. The returns under the Metalliferous Mines Act only give the number of persons employed, the fatal accidents and the deaths. In each case there is a marked decrease. The proportional reduction in accidents is even greater; for, whereas there were 68 fatal accidents in 1883, causing the deaths of 86 persons, there were 54 fatal accidents, causing the death of 56 persons in 1884. Thus, while the number of persons was reduced by about 12 per cent, the fatalities caused to them decreased by about 35 per cent.

The fact of a reduction of product is unprecedented, for the gain has been steady. Former years have indicated steady advances in the demand. The causes which have led to this most exceptional state of things are far less conclusive than is the state of things itself. Yet they are all important, both to the coal mining industry and also to the nation. Few thoughtful men are without uncomfortable apprehensions as to how that wealth is to be husbanded certainly till the nation has discharged its liability to its creditors. Some of these even talk of an export duty on coal, while at the same time abundant reasons can be brought forward why this should not be done. Thus, millions of tons each year must be reducing the stores of fossil fuel at a very rapid rate.

Nova Scotia Mines.

In Nova Scotia, in the matter of gold mining, the returns show that 118,087 days' labor were performed, and 25,147 tons of quartz were extracted and stamped, yielding 16,079 oz., 14 dwt., 10 grains of gold during the year 1884.

The average yield was 12 dwts., 18 grains per ton of quartz, etc., stamped; this is 1 dwt., 21 grains higher than the average for 1883, and is partly due to the lessened amount of low-grade ore stamped in Sherbrooke.

Several large lots of low-grade ore have been profitably mined, among them may be named 9,799 tons at Salmon River, yielding at the rate of 6 dwts., 25 grains per ton, and 1,579 tons at Renfrew, yielding at the rate of 6 dwts., 18 grains per ton. The richest yield the returns show is 2,212 oz., 8 dwts., from 913 tons of quartz, stamped by the Gallagher Gold Mining Company, being an average of 2 oz., 8 dwts., 10 grains to the ton.

The Parrott Silver and Copper Mining Company, Montana, has reduced its force on account of the low price of copper rendering the reduction of their ores unprofitable. No ore has been taken out since January, and only one reverberatory furnace is running and making a general clean up. They formerly worked 400 men, but are now working about 100.

Combined Amalgamation and Concentration of Silver Ores.

W. McDermott, of New York city, read the following paper before a recent meeting of tbe American Institute of Mining Engineers:

It is well known tbat many so-called free-milling silver ores are so classed more from their value necessitating a cheap process than from a real adaptability to raw amalgamation. Such low-grade ores, carrying more or less sulpburets, are more profitably treated by a cheap rapid process than by tbe more effective but costly process of roasting and amalgamation. Tbe tailings are sometimes crudely concentrated, or, after lying and becoming partially oxidized, are again worked in pans. Of late years, by the use of improved methods of concentration, many of old low-grade tailing-piles have been reworked to a good profit; and in some improved mills arrangements are made to concentrate before or after amalgamation, tbus making a single treatment in mill suffice.

It is self-evident tbat on a low-grade ore a small increase in percentage saved is of no commercial advantage if accompanied by a material increase in cost, and therefore a cheap and continuous system of work is the real necessity if a fair eaving is to be effected. As an illustration of tbe possibilities of combined concentration and amalgamation on some ores, tbe following

Results of a Working Test

At tbe New York Ore Milling and Testing Works will be of some interest:

The ore treated was a hard white quartz from Mexico, carrying a very small peroentage of finely divided sulpburets, chiefly iron pyrites. The original average assay was 35.5 oz. silver and 0.125 oz. gold per ton. The ore was stamped wet throngh a 40-mesb screen and passed direct to the Frue vanner. The concentrates produced were about one per cent of the original ore, *i. e.*, 100 tons into one.

The concentrates assayed 1,397 oz. silver per ton, and 5.2 oz. gold per ton. The tailings from the vanner assayed 16.4 oz. silver per ton and 0.05 oz. gold. The tailings were run into a settling tank and afterwards worked by a regular pan-amalgamation, yielding bullion .858 fine, and tbe settler-tailings assayed 4.1 oz. silver per ton with a free trace of gold. The combined process yielded, therefore, about 89 per cent of the assay value. In this test about one-third of a ton only was operated on and a certain quantity of ore remained in the battery which was weighed and assayed and proved to be concentrated to a value of about $100 per ton in gold and silver. It may safely be assumed that the precious metals which coucentrated in the battery would in regular runnlng be found in the concentrations and bullion to the same percentage as tbose in the discharge of tbe battery. But should this method of calculation be objected to, the following figures based on actual yield of test are reliable:

Bullion value in original ore by assay,	$14.51
" " of ore left in battery,	3.41
" " " " discharged and treated	$11.10
" " concentrations by assay	$5.77
" " bullion from pan,	3.81
" " total yield,	$ 9.58
Loss by difference,	$ 1.52
Bullion yield of settler-tailings by assay	$ 1.42

Of course it is not possible to clean up accurately in a small test either the few pounds of rich concentrates, or the small quantity of bullion from the pan; but a substantial agreement of yield witb the differences between assay of original ore aud tailings justifies confidence in the result of the test. The samples of tailing from both concentrator and settler were taken by automatic sampling machines, and the settler-sample was further checked by a sample taken from the pan just before discharge. These points are mentioned as an excuse for basing calculations as to working proceeses on so small a test, in which, however, it is to be noted that the actual operation was exactly the same as it would be on a large scale. Tbe stamp battery was fed by automatic feeder; the concentration was automatic and similar to that in any gold mill; tbe pan charge wes run but eix bours with a small quantity of bluestone and salt. In speaking of the

Percentage of Value Saved

As 89, two assumptions are made, viz.: first, tbat the residue in battery was from the fact of its concentration as susceptible to treatment as the discharge of the battery; second, that the contente of the rich concentrates constitute a final product. These assumptions are correct enough for the general purposes of this paper. The percentage of loss in subsequent reduction is of course very small per ton of original ore crushed. The additional cost of concentration in a properly arranged mill for amalgamation is extremely small, ae it necessitates even in a 40-stamp mill not more than two extra men in 24 bours, witb a consumption of hut trifling power. If continuoue amalgamation he employed, the whole process is of course cheapened etill more. The process is adapted to low grades of ore, carrying sulphurets, wbich it is not advieable to roast; and even some higher grades, under certain local conditions, will yield better commercial results tban by any procees involving a preliminary roasting. The disposition of tbe small quantity of rioh concentrates is determined hy local conditione; the product can either be roasted and put through the pane, smelted with other ores or sbipped to reduction works. The roasting of a small, rich product is of course a very different matter to roaeting the whole of the crude ore, and can be done in a small, cheaply huilt reverberatory furnace. Where tbe ores and local conditions favor, raw leaching by tbe Russell process can take the place of amalgamation, leaving tbe same work of utilizing the snlphurets to the concentrators.

Hours of Labor.

The Societe Industrielle of the nortb of France appointed recently a special commission to inquire into the probable consequences of tbe proposed reduction of the hours of labor in textile factories. The working-day in these factories now consists of twelve hours. In the interests of tbe workpeople, efforts have been made to shorten the day to ten hours. The commission heard evidence oa tbe spot from all tbe parties interested in the question, and in the recommendations appended to tbeir report tbey pronounce decisively against the change. They are of the opinion that in tbe face of Englisb and German competition the hours of labor cannot be shortened. They point ont tbat tbe proposed change would injure rather than benefit tbe workpeople, inasmucb as tbe rate of wages could not be raised to compensate the ehorter day, and consequently tbe week's earnings would be proportionately diminisbed. And they furtber add that experience shows tbat much of the spare time thus gained would, in the present social conditions, be spent in public bouses, to the detriment botb of health and wealth. Just now, when the colliers are agitating for a further reduction of the working-day, which, by the way, is now mucb shorter for them than for the factory bands, these utterances of the commissioners are worthy of careful consideration; and tbe misguided followers of the Basly herd would do well to ponder over them to see how far they are applicable to their own case.

With respect to the length of the working-day, a recent debate in the German Reichstag is particularly interesting. The disclosures made on that occasion by the supporters of the measurc for prohibiting work on Sundays and holy days, and for relieving overworked women and children, enable us to obtain a glimpse of the causes which have rendered German competition so formidable. It appears that in some industrial localities the working day is more than twelve hours long. In the Dusseldorf district it consiste of thirteen hours; in that of Treves and Aix-la-Chapelle from tbirteen to fifteen hours; and in Franconia it attains the wearying length of sixteen honrs. It was also pointed out incidentally during the debate that in many industries women and cbildren, on account of their lower rate of wages, were more and more supplanting men in their occnpations. These also are important facts wbich the working men of the rest of Europe would do well to consider. It should be borne in mind, too, by the British workman, tbat the wagee of the German are lower than his own. With sixteen bours of labor a day and no Sundays or holy days, the German toiler is surely safe from the destructive influences of the public house.—*Colliery Guardian.*

Mine Leasing.

The lease system of working mines continues to grow in favor in this section. We know of a number of experienced mining men who are figuring with mine owners for the lease of propertics tbat have been idle for some time, hut which, nnder careful and economical management can he made to yield handsomely to lessce or lessor. There are a large number of properties in Altusas county that show fine bodies of ore, but the grade is too low to leave a margin to tbe shipper unless the closest economy is observed. It is in the observance of tbe strictest economy, in that close attention to detail that lesseesexcel. As a rule, he works himself, and when not working, can be fonnd nevertheless, carefully supervising tbc work. The owner, on the other hand, generally leaves the work of snpervision to a high-priced superintendent, and the profits from the ore go into his pocket. The majority in this country undergoing development at present are in tbe hands of lessees, and without exception all of tbem are making money. Tbis, too, in the faoe of the fact that in several instances tbe owners actnally lost. In addition to the profitahle workings of such properties, a wholesome lesson is taugbt to the average mine owner, and that is, that economy is as mucb of an essential to succeseful mine working as it is in any branch of business. There are some few mines that can etand an expensive management and still leave a profit to the owners, but the majority of properties are not of this kind. The advent of the lease system is significant. It means the employment of a greater number of men and more proeperous times.—*Inter-Idaho.*

THE miners at Candelaire, Nevada, on learning that eome Chinamen were engaged stripping the ledge on the surface of the Victor mine, a meeting of tbe citizens was called and a committee eelected to wait upon the superinteudent and tbe president, informing them that Chinese lahor as miners would not be permitted. Tbe men afterwards went to the mine, but no Cbinamen were found tbere.

Idaho's Mining Districts.

From an article in the Idabo *Keystone* we take the following:

There is a good reason to believe tbat Idabo is just entering upon a season of development and prosperity that must advance the whole Territory as well as each individual interest. All over the Territory the outlook is good and improving. A number of new mining camps are coming into prominence, and some of the older ones are taking on new and apparently permanent life. Nearer home we might mention (ontside of Wood River) tbe Vienna camp, which bas seeu a number of new strikes the past six months, and more and better developments in the old mines. The camp is prospering, and tbe mine owners and mining companies are sanguine of a bright future.

Atlanta, through the changes in ownership of some of the old mines there, and tbe erection of additional mills and machinery, is destined to be a great gold and silver producer for at least a term of years.

In Custer county tbere is a continued mining prosperity, and while the old mines show no signs of failing, new strikes of rich ledges are common. Bayhorse is 100 per cent better today tban a year ago. The mines continue to yield abundantly of rich ore, and it is now shown beyond a doubt that the miues go to the deep. Newstrikes bave beeu made in the mines at Custer, and new discoveries are numerous and promising. The ore already in sight there gives assurance of years of production of the precious metals.

Lost River country, with its numerous mines, its wonderful area of rich farming lands and vast cattle ranges, cannot help advancing in wealth and prosperity.

Lemhi county is not behind in mining stock and agricultural progress. Some gold and silver quartz fields are being opened and machinery put in. On the Salmon river, below Salmon City, tbe new gold mill of tbe Kentuck Compauy is working successfully, and the Moose Creek and adjoining districts are coming out under development.

To tbe northwest we have the Stanley Basin country, in which new companies made discoveries last year that will pay well to work, and work has already commenced tberc. Still further nortb, along the foot of the Sawtooth mountains, ie the new Buckskin district—ten miles from Cape Horn, where some rich silver quartz ledges were opened last season.

Twenty-five or thirty miles still further to tbe northwest is the new silver-lead district of Sheep mountain, comprising about 30 locations, upon whicb marketahle ore has been found. Last season several of the claims employed pack-trains for transporting ore to Bayhorse—80 miles—and also to Ketchum smelters—120 miles distant. About 25 miles further in the same direction a new silver and gold quartz district was found late in the season, and the best quality of the ore assayed nearly $300. It is believed by prospectore to be a ricb district.

On the other side of the mountain we have increased activity in the old camps of the basin, wbile in the neighborbood of the Seven Devils country rich gold, silver and copper ledges of enormous size and wonderfully rich, are being developed. This of itself will make a very populous and active district eveu this season, as mucb of the ground is going into the hands of men able to erect smelters and mills.

The old Banner district is not behind either, in progress. New macbinery and new strikes put tbat camp on a permanent basis again as a bullion producer.

Thus we might go on, with column after column, describing new camps and new strikes in old camps, but a glance only is necessary to show that Idaho is entering upon a year of prosperity not equaled in any of our sister States or Territories. And as mining advances the farming and other interests also advance and prosper.

Coming nearer home, we have the new camp of Lava Creek, on tbe edge of tbe mountains bordering the Snake River plains, and near the stage road leading from Wood River to Arco. The ores are milling quartz, rich in chloride, or horn silver. A new town is being built there. Tbe ores average higher tban do those of any district yet discovered in Alturas county—at least so far as development has progressed.

A few miles from Bellevue, on Camas prairie, is a very extensive belt of gold-bearing quartz. A gold mill has been purchased for the mines there, and before fall a new camp will he added to tbe metal-producing districts of tbe Wood River country.

The mines on lower Wood river are well known and need no mention bere. In the immediate vicinity of Ketchum work will progress about the eame as last year. Some new prospect may be opened, and more ore put in sight. Up Warm Springs creek aud on Smoky a number of companies will be operating. On Trail creek there are numerous veins, some of which carry high-grade ore and considerable of it. On Eagle creek, Lake creek, Boulder and the districts on that range and helt, tbe oree are of a sbipping grade, and the veins more regular than in some of the districts of Alturas county.

It is underetood that Galena will see more work going on and more development in progress tbis season than for eeveral yeare past. The owners of Sawtootb properties likewise intend to push work on their mines this season, and tbat will be a more populous camp than since the firet year or two of its discovery.

Take it all in all, we believe tbe whole Territory will advance rapidly this season. Ketcbum being in tbe midst of an extensive mineral field, and to whicb many others mentioned are tributary, sbould be the most prosperous city in tbe Territory for many years to come. We have smelters, sampling works, a railroad, an enterprising, industrious population, and there is no visible obstacle in the way of her advancement and permanency.

A SIERRA COUNTY TOWN.—It is believed that Sierra City, in Sierra county, will, before another year, become one of tbe liveliest mining camps on tbe coast. From all indications that result is not at all unlikely. There is more prospecting now being done in that vicinity tban at any other time in tbe history of the camp. Good authority has it that first-class mining men are keeping an eye on the place, and already they are beginning to take hold of a number of the claims which have recently come to light; and others are bonding properties which bave lain idle for years, because tbe owners bave not possessed the means to develop them, but whicb were known beyond a doubt to be good paying claims. During the past six or eight months a new prospecting fever seems to have broken out among the inhabitants, and the business men as well as the miners seem to bave caugbt the plague. In fact, this fever owes its origin to the marvelously rich strike (now known as the Young America mine) made by Oliver Sunderhaus and Wash. Hughes a number of months ago. At the time the strike was made a well known business man of Sierra City offered a full-stocked grocery establishment, valued at something like $15,000, for a one-half interest in the mine, but the offer was rejected. Tbe gentleman has since, however, come into possession of a portion of the claim. The Young America lays just bebind the Sierra Buttes mountains, nearly 9,000 feet above the sea, and is on a line with and about one mile from the famous Sierra Buttes mine. This "find," togetber with others wbich have been made since, and the starting up of a number of tbe leading mines, among them the Columbo and the Marguerite, promise well for the future outlook of the place, wbich is said to have almost doubled in the number of its business houses in the past two years. And the end is not yet.—*Nevada Transcript.*

GO PROSPECTING.—The season of the year has come when prospectors can with safety, so far as the elements are concerned, go prospecting. During the present month we are liable to have some blustering weather, but the probabilities are there will be noue severe. Eastern Nevada abounds witb opportunities for those in search of either quartz deposits or placer diggings. Scarcely a week passes but that we hear favorable news from new as well as old sections. It is not absolntely necessary for a man to search for entirely new fields, inasmuch as there are many producing and promising sections witbin 100 miles of Eureka in which a man who will work and take a few chances would undoubtedly do well. It is folly for such men to lie around waiting for sometbing to turn up, as it may tbe three, and agaiu it may be six months, before there ie a demand for tbeir labor. Besides, is it not better for a man who is a good judge of ores to go prospecting—if he exercises the same judgment and thrift which is necessary for success in any business—than to be striking a superintendent or a foreman for a job? Such men wben they thus strike out show an independence which is commendable, and it is generally tbey who come out on top in the end.—*Eureka Sentinel.*

LEACHING.—Mr. Bailey, who is in partnership with Nesbitt and otber parties at Silver Reef in leaching the Leeds tailings, spent several days in Bullionville during the week familiariziog himself with the process as conducted by Mr. Russell. Mr. Bailey is leacbing the Reef tailings on the "Russell process," and working them np to 45 per cent, and expects to do better, as they contain no base metals worth speaking of. As the Reef ore is free milling and costs only a trifle for crnsbing, and as tbere are thousands of tons of it that will assay from $15 to $25, Mr. Bailey seems confident that leaching will eventually take the place of the amalgamating process, in whicb case the gentleman predicts many years of prosperity for tbat camp.—*Pioche Record.*

THERE will be no Exposition tbis year at Denver. The ventnre has been au unprofitable one from the start, and it ie not probable that tbe present management will ever again attempt to throw open the doors of the bandsome building for the purpose for which it wae erected. The people do not realize the valne and importance of an exhibition of onr mineral wealth, and it will be necessary to educate them up to tbe proper standard before another and successful Exposition will be possihle.—*Rocky Mountain Mining Review.*

A DISPATCH from Quijotoa (A. T.) saye: A rich strike was made to day at Covered Wells. Samples of ore assayed go up in the thousands. The town is greatly excited. Construction of the mill will be pushed as fast ae possible. Lumber has been ordered for a tramway and work will be commenced in a few days.

BRICK-MAKERS from Salt Lake are expected in Bullionville in about a week. It will take about 350,000 brick to build the Stedefelt furnace that the leaching company is going to erect.

Disturbances in Trade and Industry.

The present is an era of great disturbances in trade and manufactures, and of commerce as well. New processes and new machinery often work complete revolutions in modes of manufacture. New and changed means and rates of transportation often remove important centers of trade from one point to another. Steam has almost entirely extinguished many handicrafts, and is most economically applied to almost every department of industry from that on the largest possible scale to that of the most minute and intricate. Within a few months even, fingers of iron and steel have been most successfully applied to the intricate, and until now, seemingly impossible process of picking cotton in the field. Industrial concentration is perhaps above all the rule of the age. Steam is its chief aid, and every development aggravates the general tendency to aggregation—to the concentration of business in large and larger establishments, and the consequent extinction one after another of the smaller. Trade is monopolized, not necessarily by great capitalists, but by great capitals. In every trade the standard of necessary size, the minimum establishment that can hold its own in competition, is constantly and rapidly raised. The little men are ground out, and the littleness that dooms men to destruction waxes year by year. Of the cotton mills of last century a few here and there are standing, saved by local or other accidents, while their rivals have either grown to gigantic size or fallen into ruin. The survivors, with steam substituted for water power, with machinery twice or thrice renewed, are worked while they pay one-half or one-fourth per cent on their cost, rather than abandon a property utterly unsalable. The case of other textile manufactures is the same, or stronger still.

Steel and iron are the monopoly of gigantic foundries. The chemical trade was for a long time open to men of very moderate means, but recent inventions threaten to turn plants that have cost millions to waste brick and old lead. Where monopoly or aggregation fails, trade agreements step in, temporary in their nature, but, while they continue, oppressive to the last degree to the people. Immense plants of machinery and expensive appliances are kept idle, at large yearly payments for their idleness, in order that others may reap larger profits; but the people have to pay the interest on both the moving and idle machinery, in addition to the greater profits thereby enjoyed by the former. Fleets of steamers are often thus laid up, and railroads subsidized to refuse freights from certain points.

Every year, and in almost every important locality in the Union, these things happen to one or another of our larger or minor industries.

Until quite recently the retail trade has been the resource of men whose character, skill and thrift has enabled them to dispense with large capital. But of late even this branch of trade, which gave remunerative employment to so many of our people of small means, has been superseded or monopolized, more or less, by large capitalists with vast and skillfully organized establishments, with which men of smaller means, however diligent, honest and capable, could not successfully compete.

Thus it is that year by year the big fish are eating up the little ones—the rich are growing richer and the poor poorer, until the promise of the early future is a distinctive division of society into two grand classes—the rich and the poor, with few or none to represent the great conservative class of well-to-do people, upon whom now rests the responsibility of keeping up a healthy equilibrium in the body politic. These facts afford much food for thought, in view of the grave consequences which may result from modern innovations in industry and trade.

How to Retain Good Workmen.

How to retain good workmen in a machine shop, or anywhere else, indeed, is an important question. An exhibitor at the late Philadelphia Electrical Exposition drew much attention to his exhibit, by posting up this question in a conspicuous manner at his stand. It was answered by a short circular which he distributed to his callers, the gist of which was that the proprietors of the works should always supply their workmen with good tools and convenient appliances and other facilities for working. This is one of the very best means of always securing and keeping good workmen. He might with equal justice have added that similar means greatly increase the production of a shop, and have the effect not only of keeping the men satisfied with the place, but of providing the owner with the means of paying the men their wages and of maintaining a balance on the right side of his ledger. When the proprietor of a machine shop gives his men poor tools to work with he cannot complain at their producing inferior work. Inferior work habitually turned out of a shop soon stamps its character on the establishment, and that entails certain loss of orders. A gentleman, closely identified with extensive machine works, says that it paid him to renew a tool by the time it had been in use ten or twelve years. If more machine shop owners were imbued with this sentiment, there would be fewer tumble-down "old established" shops around, and the machine business generally would be in a healthier condition.

USEFUL INFORMATION.

Imitations of Leather.

"The oft-quoted statement," said a veteran shoe dealer to a reporter, 'There are tricks in all trades but ours,' is the completest fallacy ever perpetrated upon an unsuspecting public. The fact is that there is no given trades in which frauds are not continually conjured and successfully worked. I will tell you a few in our business, for I am best informed on the subject, having been in the wholesale manufacturing trade for a score of years. Right here let me tell you the cause of it. In any business there is a continual struggle between manufacturers, and this makes it necessary for them to economise and figure to reduce cost in the most trifling details, for it is the few cents margin that makes the profit which enables the fortunate to wear diamonds and drive fast horses.

"Some years ago there was a rage for cheapening goods. Cheap substitutes for standard stock were eagerly sought for. They found them, too. A prominent manufacturer here, who has a good reputation, and does a business amounting to hundreds of thousands annually, devised a scheme some time ago which was destined to make big profits. The advantage is the extra protection to the toe, making two thicknesses of leather there, and especially in children's shoes. Well, this man cut a piece off the vamp at the toe, and joined the vamp and tip by stitching them as usual. The result was only one thickness of leather there, and when the tip was worn through there was a hole in the shoe."

Vegetable Leather.

A vegetable leather has been produced by M. Bauer, L. Brouard and J. Ancel at Paris; it is said to be fully equal to leather, and a non-conductor of electricity and waterproof. It is a proportion of 3 kilogs. gutta percha, 900 grams sulphur, 1 kilog. raw cotton, 600 grams white zinc, 100 grams kolkothar, and 250 grams oxide of antimony. The mixture is then vulcanized similar to rubber. Gutta-percha and sulphur are necessary ingredients, while the other parts may be replaced by chemicals of similar character. The quantity of the various ingredients may be varied to suit the purposes.

Another method for preparing an equivalent of leather is the following: Animal albumen, either alone or with some dextrine or gum, is mixed with glycerine, fat vegetable oil and a concentrated solution of india-rubber. This mixture, if desired, after dyestuff is added, is poured upon level plates and left to harden, after which the layer is put on a stretching frame and dried at a low temperature. The stuff is finally tanned like leather by submerging it in liquid tanning stuff for a shorter or longer time.

Spiders and their Peculiarities.

A recent German scientific journal gives some interesting notes upon spiders by F. Dahl. He claims that their sight is imperfect, except at very short distances; and, in consequence of this, their sense of touch is so well developed that when an object falls into their net, they can tell upon exactly which radius the object has fallen, though to ascertain this they must first go to the center of the web, even though the object may have fallen near their original position. Their smell and hearing are also excellent, the former so much so that they can distinguish odors. The remarkable instinct possessed by the geometrical spiders is shown by the fact that the first web made by the young is perfectly geometrical. That they reflect, is proved by the fact that they despise certain kinds of tough, chitinous insects, which they have unsuccessfully attacked before. This reflection is to be distinguished from the instinctive dread which they have for bee-like flies.

In regard to the voracity of the spider another journal gives the following: A spider, by a careful estimate made by means of actually weighing it and then confining it in a cage, ate four times its weight for breakfast, nearly nine times its weight for dinner, 13 times its weight for supper, finishing up with an ounce, and at 8 P. M., when he was released, ran off in search of food. At this rate a man weighing 160 pounds would require the whole of a fat steer for breakfast, the dose repeated with the addition of a half dozen well-fattened sheep for dinner, and two bullocks, eight sheep and four hogs for supper, and then, as a lunch before going to his club banquet, he would indulge in about four barrels of fresh fish.

A PECULIAR WHEAT TEST.—A peculiar case of wheat testing is made known by Mr. Groat, emigration agent of the Northern Pacific. He sent samples of a fine appearing grain raised near Jamestown, Dakota, from a new Russian seed which yields 40 bushels to the acre. Two samples were sent to Minneapolis and a third was submitted in St. Paul. The three reports agreed in declaring the wheat worthless. The inspectors knew nothing whatever of the origin and character of the wheat, or that other inspections were being made, but each of the reports was the same. The grain was declared to be brittle and below grade. In the bulk it bore such a resemblance to No. 1 hard that it might easily have sold for that grade to an unsuspecting buyer. It is purely an experimental wheat and was so submitted for test. The unanimity of the inspectors can leave no doubt as to its true value.

SOUND ADVICE.—The American Iron and Steel Association gives the following advice to workingmen, which is worthy the thoughtful attention of all classes of people:

Begin now to save where you can; resolve to wear the old coat another winter; leave the buying of expensive roasts and tenderloin steaks to those who can afford them; learn to distinguish between food that is cheap and nourishing and food that is high in price; if you cannot afford a visit by railroad to a far-off cousin or other relative, who has enough to do to take care of himself, stay at home; home is the best place anyway. Cease copying the ways of the rich; all cannot be rich; keep in your station, but honor it; respect yourself by not pretending to be better off in this world's goods than you are; shun the grogshop, and, if you must be a slave to tobacco, let this slavery take as little money from your pocket as possible. Whatever your wages may be, don't fool them away. Take them home when earned, and thank Providence that the enterprise and skill of others have given you the opportunity to earn even low wages, so that you may have even a humble home. Be thankful for what you have and be cheerful. Don't grumble, don't drink fire-water, keep at work, save the pennies, and you will get along. This is a goodly land, and if there is anything wrong with the industries of the country to-day, it will be righted by and by.

OIL-STONE POWDER FOR GRINDING PURPOSES.—Although modern practice discards as far as possible the grinding together of surfaces where accuracy of fit is required, because the abrasive power used, particularly emery, is apt to get imbedded in the metal, and then it will continue to grind, and of course ultimately deteriorate the fittings. Pieces of oil-stone finely pulverized, sifted and washed, are used by mathematical instrument makers in preference to pumice-stone powder for grinding and polishing superior brass or gun-metal work. It is also used by watchmakers and mechanicians on rubbers of pewter, for polishing steel, as well as in slips or square pieces a few inches long, used after the manner of files.

NAILS IN A POUND.—It is said there are ten more nails in a pound of 8-penny iron nails than there are in a pound of 8 penny steel nails. If this is true there would be 1,000 more nails in a keg of 8-penny iron nails than there would be in a keg of steel nails. The count is said to have been made at Wheeling.

PLATING SMALL PIECES WITH BRASS.—Dip them in a solution of six grammes sulphate of copper and six grammes chloride of tin dissolved in one liter of water. Or dip them in a solution of 9½ grains sulphate of copper and 9½ grains chloride of tin dissolved in 1½ pints of water.

THE FIRST SHIPMENT OF COTTON.—The first appearance of cotton as an article of commerce was a shipment of seven bales from Charleston in 1757. In 1880-81 the crop was 6,000,000 bales. The yield of 1884-5 was about 7,000,000 bales.

GOOD HEALTH.

Cancer, Malaria and Consumption.

These three above named and other dreadful evils are much discussed by press and doctors of to-day.

1st, Cancer. My father had what the doctors all agreed was a cancer on the back of his hand. It continued growing for years, but was finally cured, and he is now young at 80 years of age and no trace of cancer left. The method of cure was as follows: He procured a large lot of sheep sorrell, bruised it and pressed the juice into a quart bowl. This was placed on the stove till evaporated down to one-fourth of an inch thick, forming a plaster to cover the cancer. After two days of severe pain he took off the plaster with the cancer and its roots, that no knife could have reached without greater injury.

2d, Malaria. I use the simple old remedy—thoroughwort (boneset). I send to Illinois in July and have the flowers and leaves gathered. Take enough to make a tea of a pleasant bitter, and when cold drink freely. This is a sure cure for malerial diseases.

Mutton broth or mutton cooked nicely any way will often cure internal ulcers or summer complaint of long standing. Mutton has greater healing powers than any other meat.

3d. Consumption generally is the cause of a cough that fatigues the system, bringing on bronchitis then consumption. Wister's Cough Lozenges have never failed me in stopping the cough on at least 50 persons and allow nature to do the cure when Wister's genuine cough lozenges are used. L. F. MOULTON.

CRAMPS.—When one is suffering from nervous debility, and much wearied from over-exertion, the muscles are apt to make spasmodic contractions. The arms, hands, fingers and legs are drawn up without volition, and held as by an iron grasp. This condition of the limbs is commonly called "cramp." It is likely to come on while bathing in cold water, or when exposed suddenly to a low temperature. If the cramp is local, affecting only one limb at a time, make an effort to extend the leg or part affected, thus stretching the muscles under the spasm. At the same time apply warm water, if accessible, and rub vigorously with the hands. If the cramps are general, affecting all the limbs, put the person afflicted into a hot bath as soon as possible. If such a thing is not to be had, apply hot water to one limb at a time, keeping the rest of the body wrapped in blankets or extra clothing. Rub vigorously with the hands where the affected parts are accessible, and get the patient into a warm bed at the earliest convenience. An effectual method for preventing cramp in the calves of the legs, which is so exceedingly painful, is to stretch out the *heel* of the leg as far as possible, at the same time drawing up the toes toward the body. This will frequently stop a fit of the cramp after it has commenced, and any one will, after a little practice, be able generally to prevent the fit coming on, though its approach be between sleeping and waking. Persons subject to this complaint should have a board fixed at the bottom of the bed, against which the foot should be pressed when the pain commences.

Beware How You Drink.

What many people, especially children, call thirst is merely a sense of dryness in the mouth and throat. This uncomfortable sensation is caused by the general habit of breathing through the mouth. The air taken into the lungs dries the mouth, tongue and the upper portion of the throat. To drink for the purpose of relieving a mouth made dry by being open, is frequently to overload the stomach with fluids which are not needed, and which, consequently, are detrimental to digestion. It is peculiarly injurious also, for it washes into the stomach all the foul solids which, in the form of dust, find their way into the mouth and throat.

Persons who are compelled to cool and moisten their palates should first rinse the mouth with a sip or two of water. If, afterward, they feel that they must drink they should imbibe by single sips. By this method they will be as fully satisfied with a gill of water as with a pint hastily swallowed.

Ice water is the great American vice, and probably kills more persons than rum. That it is cooling to the entire system cannot be denied, but sudden changes of physical temperature from warmth to coolness are always detrimental to health.

Actual thirst is as quickly satisfied with hot water as with cold. When only ice water is desired the probability is that the person drinking it has eaten something which has irritated the stomach.

The rage for salt, pepper and mustard may be charged with much of the inordinate thirst which makes the traveling American a marvel to his European cousins. Water, to which has been added one-twentieth part of its weight in ice is cold enough for any properly fed person.

Coffee is not a good summer drink. Its stimulating property is beneficial to persons with a sense of physical debility; but coffee arrests, temporarily, all natural processes of waste, whereas in hot weather these should be allowed full play. Tea is a far better drink. It is stimulating, and is therefore very injurious when taken in large quantities; but overstimulation, with its implied necessity of in some way making good the physical force which it enables to develop too rapidly, are its only bad effects. Taken without sugar it is cooling, but a heaped teaspoonful of sugar will generate as much physical heat as a quarter of a pound of beefsteak. Sugar is the most heating of all articles of human consumption.

WORK IN HOT PLACES.—The limit of temperature at which men can work depends upon the length of their exposure, the amount of exertion they put forth, their condition and the nature of the atmosphere, particularly as to its degree of moisture. Men have been employed on railways at 104 degrees, in mines—under very favorable conditions—at 125 degrees, and are said to work occasionally in the stoke-holes of tropical steamers at 156 degrees. Professor Du Bois Raymond has estimated that a temperature of 122 degrees can be endured when the air is as dry as possible, but that even 104 degrees is likely to be fatal in an atmosphere saturated with moisture. It is considered certain that men cannot become accustomed to stand, for any considerable time, a higher temperature than from 140 to 165 degrees, even when they keep perfectly still and airs in quite pure air.

CANNED FOOD.—It is a singular fact that we are indebted to Pompeii for the great industry of canning fruit. Years ago when the excavations were just beginning, a party of Cincinnatians found in what had been the pantry of a house many jars of preserved figs. One was opened, and they were found to be fresh and good. Investigation showed that the figs had been put into the jars in a heated state, an aperture left for the steam to escape, and then sealed with wax. The hint was taken, and the next year canning was introduced in the United States, the process being identical with that in vogue in Pompeii 20 centuries ago. The old ladies in America who can tomatoes and peaches do not realize that they are indebted for this art to a people who were literally in ashes but a few years after Christ. There is nothing new under the sun. Canned tomatoes and loaded dice—the people of Pompeii had both.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MEDIAN.—*Ledger*, April 11: This quartz claim, located east of the Keystone at Amador City, continues to give every promise of proving a permanent paying mine. The work in hand is the sinking of the shaft on the ledge. This shaft is now down over 100 feet. At the bottom the ore looks remarkably well, both as regards its gold-bearing character, and general live appearance. Some of the specimens taken out are thickly studded with free gold; indeed, parties who have been conversant with the quartz met with around Amador City for many years, say that the ore samples lately taken from the Median are equal in richness to anything that has been heretofore met with in that camp.

ST. JULIAN.—In sinking a winze at this claim another body of rich black metal was struck the latter part of last week. Samples of the ore have been exhibited in Jackson during the week. One of them has a spike of free gold a quarter of an inch thick running through it. It is said that over $1,000 was taken out last Saturday. The strike was made in drifting from the winze at a point 25 or 30 feet below the tunnel level. The seam varies in thickness from two or three inches to a foot. The one-stamp mill has been overhauled and put in good running order. Messrs. J. R. Price, D. D. Mason and Jos. Chatham are working the mine on an agreement that the net profits be divided equally with the owners.

MOORE.—The first installment of the purchase money, amounting to $1,500, was paid early last week. A few men have been put to work cleaning out an old shaft, located on what is called the limestone lead. It is on this lead that prospecting operations will probably be commenced, and the prevailing opinion is that pay ore is more likely to be met with here than at any other point.

VALPARAISO.—This mine, owned by Ginocchio Brothers, adjoins the Mammoth mine on the north. Four men have been at work for some time working two shifts. At a depth of 300 feet a drift is being run south in the hope of striking the rich bonanza vein met with in the Mammoth. A few days ago slate mixed with quartz and freely charged with sulphurets was reached, which is taken as a favorable indication that the ledge is not far off.

MISCELLANEOUS.—A. P. Clough, near Volcano, some time ago picked up a chunk of gold out of his irrigating ditch worth $16. Mr. Reynolds, who is working a gravel claim near Volcano, under lease from A. P. Clough, last week picked up from the bed-rock in the vicinity of the giant, over $100 in coarse gold. The machinery for the 20-stamp mill for the Morgan & Shugert claim in Hunt's gulch has been arriving this week. There are about 100 tons of it altogether.

Inyo.

THE SANTA RITA SOLD.—Inyo Co. *Register*: Phil. Cartier and Peter Foisy have just sold the old Santa Rita mine to John H. Gay. This mine is situated on the mountain west of Mazourka canyon, opposite Independence. Considerable work, with good results, was done on it some years ago, but water coming in, operations were suspended. Though always under location, no work except by the late locators has since been done upon it.

THE MAXIM.—W. A. Stansfield is taking out considerable ore from the Alaska mine at Chrysopolis, and expects to start the Maxim mill in a few days. The ledge at a depth of 36 feet in the Alaska shaft shows about 14 inches of pay ore, which will undoubtedly pay from $40 to $60 per ton. As this ore can be mined and hauled to the mill at a cost not to exceed $4 per ton, it will leave a handsome margin.

FOR A TEST.—W. A. Bolinger last Monday shipped 100 sacks of ore from his mines at Chrysopolis, for the purpose of ascertaining the best mode of them. They are gold sulphurets, and will probably realize from $10 to $20 a sack.

THE BROWN MONSTER.—Messrs. Bell & Thomas are taking galena ore from the Brown Monster mine. During the past month they have taken out eight tons, and will ship a carload in a few days. This ore is quite rich in gold and silver, and leaves a neat margin for profit to the mine owner, besides paying the contractors very well.

THE WHITE STAR.—Messrs. Alexander, Kehoe & Barnes continue to take out galena ores from the White Star, and with a better showing than ever.

THE OLD UNION.—This large silver-lead mine lies four miles south of the Brown Monster. Reynolds & Treglown have been shipping ore from it for months. The ores from all these mines go to San Francisco since the wanton destruction of the Elna furnace, entailing extra expenses.

INDIANA MINE.—This is a rich silver lead near Swansea. Thorpe & Jenkins have been working it on lease for months, and now have ready for shipment a fine lot of ore worth from $600 to $1,000 per ton. A previous lot (over a ton) from the same mine netted over $3,000 per ton.

FURNACES.—Gorman & McKenzie will fire up the Defiance at Darwin in a day or two, on ore from the Lucky Jim mine principally. Fitzgerald will have the Modoc at Lookout, in blast about the 12th of this month, and for a long run.

SILVA'S FIND.—Frank Silva's recent find at Darwin is said to be one of the finest silver ledges in the county. As stripped to hnd the course, it shows about three feet of 100-ounce ore, with scarce a break for 120 feet, as far as stripped at that time.

COTTONWOOD.—The Greenly 5-stamp mill on Cottonwood creek, Deep Spring district, will start up May 1st, on ores from the "78" mine. This lot is from below all former workings, and is said to prospect in free gold far better than any yet extracted from that mine.

THE REWARD.—This is the name of Messrs. Coates & Freeman's recent and notable find. It is generally spoken of as the "Ward" mine, which is not the name at all. The mine is situated about eight miles westerly from this town, and about half a mile south from the stream of the same name (Bishop creek). The two owners are driving ahead continuously, finding spots of fine ore all through the vein matter, which is about six feet thick.

THE BROCKMAN—Six miles west of the Reward Mr. M. C. Brockman is working away on an eight-foot ledge of low-grade gold ore. Several assays, besides many horn prospects, give him high hopes of a $10 working average.

Kern.

KRAMER.—Cor. Calico *Print*: A shipment of ore to San Francisco was made by Mr. Garrison from his mine, the Silver Age. Mr. J. L. Coffman, of the firm of Coffman & Maxey, is at present inside endeavoring to secure additional milling facilities, as their one-stamp mill now running day and night is found inadequate to reduce the output of ore. It consists of a six-inch mortar, 3-pound stamp with gas pipe extension, and muscular motive power.

Mono.

CON. PACIFIC.—Bodie *Free Press*, April 12th: Since last report they have been running in vein northwest from drift No. 1. They have made seven feet, and are able to note a decided improvement since last report. In face of drift they have a fine vein of eight inches. Had no assays during the past week, as there has been no perceptible change in the quality of the ore from report given last week. Will continue driving for No. 2 vein as fast as possible, where they confidently expect a larger and even better vein than they have in the face at present. Have been troubled somewhat with bad air in the cross-cut, but hope soon to overcome that trouble and be able to report a good vein cut in Pacific No. 2.

STANDARD CON.—During the week ending April 11th men were employed as follows: 20 miners, 2 carmen, 1 station tender, 2 shaftmen and 1 fireman at $4; 2 laborers at $3.50 and 1 engineer, 1 carpenter, 1 blacksmitb, 1 punipman, 1 shift boss at $5 per day, and 1 foreman at $200 per month.

BODIE CON.—During the past week 168 tons of ore were crushed at the mill. The bullion from this will be shipped together with the product of last week's run by to-morrow's express. They have stopped hauling ore to the mill, finding the grade too low to work at a profit. They have commenced prospecting in the mine with a full force of men. Thirty-nine men are employed.

MONO.—The Mono south drift has been extended during the past week 15 feet. Its total length from the Bodie line is now 281 feet. The winze has been sunk 10 feet; its total depth being 55 feet. Six miners employed.

Nevada.

PLANET MINE.—Grass Valley *Union*, April 11: Work has been resumed on the Planet gravel mine, on the divide between Steep Hollow and Bear river. The recent purchases of the Dewey claim by the Planet Company gives the latter the ownership of all the ground between the two streams, and about one and a half miles along the divide through which the gravel channel runs. The combined property is tunneled on each side of the divide—the one on the Bear river side having been driven to the pay channel several years ago, but the tunnel being too high the ground could not be worked to advantage on account of the difficulty of handling the water. The tunnel driven in the Dewey claim on the Steep Hollow side is lower than the bottom of the gravel lead, and this is now to be extended to a connection with the Planet drift and will drain off all the water. The distance to be driven is 800 feet, all through gravel, and rapid progress can be made. It is expected that fair pay will be reached before connecting with the bottom of the Planet drift, where rich prospects of coarse gold were obtained when a suspension of work was compelled when the last operations were carried on.

NOTES.—Grass Valley *Union*, April 11: The ledge in tbe Prescott Hill tunnel, Osborn Hill, in the old Wheal Betscy ground, is not showing very large at the time, but it is of good quality. There has been a report that the tunnel running from the level of Wolf Creek into the Lawrey & Long quartz claim, on Winchester Hill was to be extended into the Empire ground, Ophir Hill. There have been surveys made, but the distance is too far and the probable cost too great to make the undertaking practicable. Since work was resumed at the Pennsylvania the shaft has been pumped out, and everything is now in working order. The drifts on the 175 level are to be extended for the purpose of opening up more backs, and a new level is to be opened at the depth of 240 ft., the shaft being down to that depth. Good pay rock is in sight on the 175 level, and it only requires the extension of the drifts to open out fine bodies of ore.

Placer.

OUR DRIFT MINES.—Placer *Argus*, April 11th: Drift mining in that portion of Placer county lying between the North and Middle Forks of the American river, is from all accounts in a fairly prosperous condition. The late purchasers of the Succor Flat mine are getting that property in shape for extensive operations; recent developments in the Mayflower near Forest Hill, we learn are very encouraging; the old Mountain Gate mine at Damascus is keeping up its reputation as a big bullion producer; the Bob Lewis mine at the same place holds its own; the Hogs Back and the Greek claim, further up the divide, have encouraging prospects ahead; Breeze & Wheeler's mine at Bath is always good; and the famous Hidden Treasure at Sunny South maintains its fame by its operations, constant improvements and unfailing dividends. With these mines in operation, and others equally good, perhaps, but as yet less developed, and our greater or less quartz interests, it cannot be said that Placer's mining interests are entirely played out, not by any means, nor that the slickens agitators have entirely succeeded in killing the county, though they tried ever so hard to do so.

San Bernardino.

THE BONANZA KING CO.—*Print*, April 12th: This company has now a force of 40 men that hoists about 12 to 16 tons of ore a day from winzes and drifts, there being no stoping done on the ore bodies. It is not likely they will start up the mill until they have about one thousand tons of ore on the dumps. The Kerr, Belle McGilroy and Mozart groups of mines are all being worked by small forces of men and have a good showing of mineral.

MESKAL DISTRICT.—This district is situated about 35 miles north of Providence. The owners, Wm. A. McFarlane and S. A. Barrett, have been working some men on their "Cambria" mine for some time past. There is a very large showing of mineral being opened up. They have run on the ledge some 80 feet with mineral all the way, and have lately cross cut the vein which shows 5 feet of good mineral.

CALICO DISTRICT.—*Print*, April 12: Jas. B. McGowan is chloriding on the Relie Key and is doing well. Some parties are chloriding on the St. George, adjoining the Occidental on the north. Work has recently been commenced on the Hyena, and the prospects of the mine at present are very good. Reeves Unsworth and his partner are chloriding on the Bullion, one of J. S. Doe's mines, adjoining the Occidental on the north.

OCCIDENTAL.—Operations on the Occidental are progressing smoothly and most satisfactorily under the management of Nels Wager, the foreman. There are 34 men employed and the force will be increased as fast as developments progress. The south-end tunnel is in 225 feet, but no work is being done in it at present. The principal work in this end of the mine is being done on the level above this tunnel and a connection will be made between the two levels by a winze. The upper tunnel is in about 50 feet and terminates at present in a large cavity formed by excavating for ore, which is about 45 feet long, 15 or 20 feet high, and about 25 feet wide, and from which about 300 tons of ore have been taken that average about $100 to the ton. Ore is seen on all sides of this cavity, particularly on the east side and south end, and shows that the body of ore dips into the hill. The width of the strata of ore at this point has not yet been determined, cross-cutting from the cavity eastward having been commenced only a few days ago. It is a beautiful and interesting sight to see the network of blue colored ore, that constitutes a considerable portion of the walls of this cavity, which is rich with black metal and chlorides. Following the car track for 1,200 feet on the west side of the hill we come to the north-end tunnel, which is in about 200 feet, and runs in an easterly direction. Further on and higher up is a tunnel that is in about 150 feet. But little ore of any consequence was struck in this tunnel until it had been driven in about 100 feet, when it took a southerly course and followed a well-defined wall, ore becoming more frequent and of a higher grade, until now the end of the tunnel has the appearance of entering a large body of ore. This tunnel is connected with a shaft and drifts above by means of an ore chute, the ore being lowered to the tunnel and taken out by hand-cars. Considerable ore has been taken from the drifts diverging from the shaft, the most of which yields $250 to the ton. The ore breaks up very easily, and the screenings are very rich with yellow chlorides. The showing at this end of the mine is splendid. From 8 to 12 tons of ore per day are taken from this mine. It is the intention that Barber's mill shall be supplied with 20 tons of ore per day from the Occidental and Garfield mines, and judging from the present developments of these fine properties twice that amount could be extracted every day if desired.

Shasta.

GOLD AND SILVER.—Shasta *Democrat*, April 8th: Dale & Fife have ten tons of ore from the Silver King at the depot sacked and ready to be shipped below to be milled. The McDonald new shaft is now down 55 feet. At 40 feet excellent rock was struck, averaging as well as that found in the old workings. N. J. Pehrson is now running three shafts on the Monarch on Oregon gulch. When the shift is down fifty feet he intends to drift. The Silver King men now have about seven tons of rich ore in sacks at the depot to be shipped to San Francisco. They are now running drifts and stoping out. We learn that a gentleman from Los Angeles has lately found some very fine lead and silver ore on Cow creek, in the vicinity of the After-thought mine. Some rich carbonates were found also. Monday last two tons of ore were taken out of the Silver King which is the richest rock we ever saw. Native silver could be seen in streaks and big chispas in every chunk of ore in the lot. The new 10-stamp mill of the Niagara Mill and Mining Company started up last Wednesday morning on rock from the Shafter mine. The mill works like a clock, and is a model of neatness and efficiency. At the bottom of a fifteen-foot shaft on the Hendricks mine on Alney creek, ore was struck that assays 25 ounces in silver. At this depth further sinking was deferred for the present on account of water. We learn that Whitton & Small, who discovered a rich claim on Squaw creek about six weeks ago, are at work building a horse arastra. We are told that last week they pounded out in a mortar in one day $14.50. Fred Simonds, Sr., returned to town Monday from a three weeks' prospecting trip on Squaw creek. Fred made two locations and from the way they prospect he thinks he has struck a good thing. About a ton of iron ore from the iron mines on Pit river near the U. S. Fishery was brought down last week and left at the depot to be shipped below for a working test. This indicates that the company who bought this property of Potter about a year ago contemplates doing something toward developing it. Robert Campbell, Sid McCoy and Johnny McCall, who are sinking a shaft on a gold lead (located last fall by Lowrey & Brincard) for a half-interest, have the shaft down now about 30 feet. The vein is about fifteen inches wide between contact walls of porphyry and slate. The rock is rich in free gold and they get ten cents to the pan from the loose vein matter. This is certainly a very encouraging prospect. Last week we met Mr. Catton, secretary of the Winthrop mining company of Copper City, and from him learned that the new mill was completed some days and all the machinery in perfect running order. The furnaces will be completed in about two weeks, when the company will commence milling. Every one is watching with intense interest the progress of this mining enterprise, and if the prayers of the people will avail anything the company will succeed in working the refractory ore of Copper City. The success of the Winthrop company will rapidly build up one of the most important and lively mining camps on the Pacific Coast.

Sierra.

PROSPECT.—*Mt. Messenger*, April 11th: A fine prospect has been obtained in the quartz ledge at the head of Coyotcville ravine. This is the ledge that James Cole put up a mill upon many years ago. The present prospecting is being done somewhat higher up the mountain, where the ledge crops out strongly. The chances for a paying ledge are first rate. William Butler has started a tunnel on the hill north of town, to prospect the quartz ledge that crops out on the point above Garibaldi's ranch. One shift is at work in the York ledge pushing the tunnel ahead to the second chute.

Siskiyou.

PICK AND PAN.—Yreka *Union*, April 9: At the McConnell claim on the Klamath river they have been running one derrick for about ten days, and the other one will be in operation in less than one week. There is at present every indication of a prosperous season's run. At the Centennial mine they have been running about a week, and good prospects are being obtained. The owners of the Kanaka claim are busily engaged in getting out timber and otherwise preparing to commence operations soon. The Empire Bar Company are nearly ready to commence sinking, and will soon be in full blast. At the China claim a bee-like swarm of Celestials are busily engaged in making preparations to commence the season's work. At the Portuguese claim preparations are also being vigorously pushed, and active work will soon be commenced. Below the mouth of Scott river Kettlewood & Co. will go into their old claim, and in consequence of the low stage of water and their dams not being carried away this season, they will soon be under full headway. Mr. Mapleson will also operate the same claim which he worked last year, and is nearly ready to commence operations. Messrs. Andrews & Hicks have formed a company, and we are informed will commence operations soon.

SALMON ITEMS.—At the Gold Hill mine, owned by Noonan & Co., and operated by a self-shooter, although water has been very slack during the season, the owners have made a profitable run. Messrs. Hutchinson, Chase & Monahan are starting a new drift in their claim. Messrs. Bevens & Girard, on account of the scarcity of water, have not been able to do much this season. Rundell, Barry & James are ground-sluicing, and it will be two months or more before they will commence bottoming up. Hickey, owing to the scarcity of water, has not been able to run over a week during the season. Ahlgren & Larsen, at the Russian Hill, have done well this season, and are at present engaged in digging a ditch from the North Fork of Salmon. Brookhouse and Ork recently went down the river with a pack-train loaded with provisions, tools, etc., to locate a claim on the Salmon, and expect to commence extensive operations soon. Marshall & Roff have gone down to locate on Austrian Bar. On Eddy's gulch, owing to the scarcity of water, not much mining has been done this season. Frank Manana & Co. have gone up the river to open up White's Bar. The Harris Bros., just opposite White's Bar, propose bringing water on from the river. They have good prospects.

Tuolumne.

POCKET.—Tuolumne *Independent*, April 11: Another big strike was made on Wednesday, in the rich pocket mines on Bald Mountain, opposite Brown's Flat. On that day Wm. Lewis, in the Sugarman mine, came upon a large gold deposit, and took out ten pounds.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, April 11th: On the 2,900 level the face of the main lateral drift north, toward the Savage line, has been turned to the left, so as to make a diagonal cross-cut in a north-westerly direction across the ore vein. This cross-drift is expected to be cutting into the ore this morning, about 40 feet north of cross-cut No. 3, and will be driven into the true merits of the vein as diligently as the situation will admit of. This is the all-important point of development for the immediate future on this level. On the 3,000 level cross-cut No. 1, near the Chollar line, is being pushed westward, and has a few feet further to go in order to cut the ore vein. As before stated, it is the intention to advance all three cross-cuts on this level simultaneously into the ore vein, all being in close proximity to its east side or boundary, and all being now about in readiness, with the expected mining magnates immediately interested to arrive this day, very interesting and exciting developments may be expected to be made forthwith.

CON. CALIFORNIA AND VIRGINIA.—On the 1,750 level the drift being run in a south-westerly direction from the main west drift, toward the old Con. Virginia ground, is progressing at the rate of about 60 feet a week. About 70 tons of ore per day are being taken from this level on company account, assaying a little over $20 per ton. The Morgan mill is again running full blast on this ore. The ground above, between the 1,550 and 1,200 levels, worked under the Jones' lease, is yielding about 60 tons per day, assaying $33 per ton. The Eureka mill is kept steadily running on this ore.

BELCHER.—The usual amount of low-grade ore is still coming from the old workings through the Crown Point. The machinery of the Belcher and Crown Point air shaft is being overhauled and put in working order, with a view to utilizing the same in repairing the shaft and working the mine to a greater depth than is done at present. Owing to this shaft being caved at some points the air circulation is impeded.

CHOLLAR.—On the 3,000 level work is suspended in west cross-cut No. 2, which is about 100 ft. south of the Hale and Norcross, and work concentrated into cross-cut No. 1, which commenced a few feet south of the line, but, running a little diagonally to the northward, it is about cutting the Hale and Norcross ore vein, at the line, where it evidently extends into the Chollar.

ALTA.—Explorations from the upraise above the 950 level are progressing as usual, with plenty of low-grade ore in sight. Occasionally a bunch of ore that will pay for milling is met with. This is saved, and quite a number of tons have accumulated which will be milled by and by.

BULLION.—The parties engaged in prospecting for pay ore in the upper levels are putting up a whim over the old Fairview shaft, which they propose cleaning out and utilizing to whatever depth they may consider eligible for a base of operations in going after the ore.

SIERRA NEVADA.—The new surface works are running all right. The repairs required to the shaft

were found to be more extensive than were expected, but the merits of the 520 level will now be investigated as soon as the station is completed and lateral drifts north and south run, from which to cross-cut west. Cedar Hill is simply a mass of low-grade ore at that point, with streaks of high-grade gold as well as silver ore running through it.

YELLOW JACKET.—About 200 men are steadily employed and the daily output of low-grade ore from the old upper workings—from the 1,150 level up to the surface—is very heavy. Between 500 and 600 tons of ore ore are taken daily from this mine, the Crown Point and the Belcher.

GOULD AND CURRY.—The main lateral drift south toward the Savage line is making about 50 ft. a week. Material, hard porphyry, with occasional streaks of quartz and clay.

OVERMAN.—Good progress is being made sinking the winze below the Lambert tunnel to connect with the old Petaluma-street tunnel, or 220 level of the Overman mine. Considerable quantities of fair-grade ore have been taken from this point in times past, and it is known that considerable more remains for extraction.

KENTUCK.—The extraction and milling of the ore from the old upper workings goes steadily along as usual with no important changes to record.

CROWN POINT.—From the 1,700 level upward good streaks and bunches of ore continue to be found, being merely the lower grade leavings of the old bonanza workings and more prosperous days.

BEST AND BELCHER.—On the 1,000 level in the main lateral drift north is steadily being pushed ahead at the rate of 60 ft. a week.

WOODVILLE.—The 300 and 400 levels continue their good yield of pay ore, which is being gleaned by leasers or tributers.

Cottonwood District.

NICKEL.—*Silver State*, April 11: E. C. Asher, of Lovelock, reports the Cottonwood mines as being in a very prosperous condition. George Lovelock the owner of the principal nickel mines in the district, has leased the property to Keyes & Hirsch, who have some 10 or 12 men at work. N. P. Davis, who has a contract for hauling the ore from the mines, which are about 40 miles from the station, has a six-horse team steadily engaged in the business. The mining force will be increased to 25 or 30 men shortly, as the lessees intend to ship a carload of ore daily. Geo. Lovelock, the owner of the mines, receives $20 per ton for all the ore that is shipped.

Eureka District.

QUIET.—Eureka *Sentinel*, April 4th: The mining situation in Eureka district is quiet. The Eureka Con. continues to look and yield favorably. The several pitches on the different levels are holding out well, and within the past few days another favorable looking body, from which good ore is being extracted, was discovered between the sixth and seventh levels in a section of ground as yet wholly unprospected. The discovery was made by a tributer and is known as the "Bennett pitch." The smaller properties of the district are producing equally as well as they have for several weeks past. Many of these mines are worked only by their owners, and for that reason the output is small, but the propositions are nevertheless paying ones to those working, as in many instances the ore is mined within a few feet of the surface and it generally furnaces from $30 to $300 a ton. During the past week the Lord Byron shipped to the Richmond furnaces for reduction 44½ tons; Dunderberg, 12; Jackson, 17; King Lear, 12; Silver Lick, 5; Dug Out, 5; Geddes & Bertrand, 1; Frazer & Molino, 7; and Bully-boy, 2. The new water-jacket furnace for the Eureka Con. smelting works arrived from San Francisco Thursday, but owing to a delay at the foundry in making the necessary castings for a foundation for the same, it cannot be erected in place for several days, and the probability is it will not be started up before the 20th inst. The building for it has been constructed, as have all other structures in connection with the new works. The pump tank, which is 16 feet long, 4 feet wide and 7½ feet deep, the same being on a level and connected with the lake by a nine-inch pipe, is among the improvements added to the works during the past week. Three pumps are being put in place, and they will be ample for all purposes or for any emergency. The location of the tank and pumps is sufficiently far away from the main building so that they can, in case of fire, be called into service and worked without danger to any one. The Richmond works and mine continue closed down.

Rickard District.

NEW LEDGES.—*Silver State*, April 11: John Gay, just in from Pete Flynn's, reports the discovery of a rich mining district in the Bloody Run mountains, between Flynn's Station and Cane Springs. The mines were discovered by ex-Sheriff Rickard and party, who were out their hunting horses. One of the ledges discovered is said to be four feet wide, and the ore is rich. The formation in which the ledge is situated is said to be black slate and syenite. "Montana" has also arrived from the new mines and brought a sack of ore that is astonishingly rich.

Taylor District.

PRODUCING WELL.—Cor. Eureka *Sentinel*, April 11th: As I predicted some time ago that it would, Taylor is beginning to boom. All her mines are in full blast, and all, or nearly all of them, are turning out high-grade ore and plenty of it. With us the day of "assessment principle" is over, and bullion shipments will be in order for some time to come. The Argus group of mines is looking splendidly, and the company undoubtedly will, at an early day, be more than compensated for the prospecting work they have done. The large bodies of ore the company have thus far uncovered is of a superior quality. Our two mills are hammering away and are turning out bullion at a lively rate. Over 100 men are working in the mines, and millmen, wood-choppers, teamsters and others are busy, and all branches of business are lively. Real estate has doubled within the past month. There is talk of some merchants coming from our neighboring town, Ward, to open business here.

White Pine District.

CLOSED DOWN.—Eureka *Sentinel*, April 11th: All work in the Eberhardt and Aurora tunnel at Hamilton was suspended on Saturday last for an indefinite period. A number of old and trusted employes who had worked for the company for the past twelve or fourteen years were among those discharged.

ARIZONA.

BISBEE.—*Tombstone*, April 11: The output of bullion from the Copper Queen has somewhat decreased. The law suit heretofore pending between the Queen and Prince mines has been decided, but still a suit for damages hangs over the Queen. It is said the Prince claims $300,000. This may account for the late draft of 25 men.

ATLANTA.—Till lately work has been principally confined to the east end of claim, where the main shaft is nearly 400 feet deep, and which cuts through a large body of fair grade ore. Now work has been resumed on the west end, with very favorable results. The present low prices of copper operate greatly against the employment of as many men as those interested in Bisbee could wish.

COPPER PRINCE.—Have nearly completed grading for their smelting site, which is situated in the canyon close to the superintendent's house. A well is being sunk on their ground, and there is every probability that the smelter when erected will be one of the most labor saving institutions of its kind in this country, with the present amount of ore in sight. It is calculated this smelter will be constantly employed for some time to come.

GRAND CENTRAL.—Mr. Gage informs us that the mine is looking as well as usual, and although no further developments have to be noted, the usual quantity of ore is shipped to the mill. As to the pumps the larger portion of the machinery is now on the way. The pumping engine, sinking pump and a portion of the column will be shipped from San Francisco next week, and by the time of their arrival the building to cover them will be ready for their being put in place.

EMERALD.—Is being steadily worked. The ore in this mine is found to be very "lunchy" and much waste has to be hoisted to keep the workings in good order. Regular shipments take place to the Grand Central mill.

STATE OF MAINE.—Pending the absence of Mr. C. W. Leach, this mine has been temporarily closed down. This puts about 25 men out of employment.

BIG COMET.—Owned by D. McCarty and Nellie Cashman, has been steadily shipping ore for some time past. In the course of a few days about 15 to 18 tons will be shipped every two days to the smelter at Charleston. The ore contains a good deal of manganese and is found to work well with the various qualities worked there.

NO COUNT.—Wm. Harwood is working away at this prospect and getting out ore. The grade, however, is not high.

SUNSET.—Captain Taylor who obtained a lease on this property has sublet his lease to some chloriders who are doing well. This is one of the oldest locations in the camp, noted in days gone by for the richness of the ore found, and as is so often the case in this camp, the ore lies near the surface.

MAMIE.—This is another of those properties being worked under a chloriding lease. Rich strikes of good ore are continually met with, but they are for the most part narrow. Thousands of dollars worth have been taken out of this property, and the present lessees are doing well.

JUNIETTA.—General Tuttle works along with his force and has quite a large number of sacks of ore stacked up. Steady work progresses and the result of steady work is known best to those interested.

EMPIRE.—It is reported that the company have $300,000 in the treasury ready to resume operations as soon as the question as to draining the bonanza mine has been settled. At present nothing is being done and the superintendent, Mr. Cutler, is now in Florida.

STONEWALL.—According to instructions from headquarters, this mine has for the present been shut down. It is uncertain for how long.

ALPS.—George Rutledge is still working away to find the body of ore he believes to be hid in the hill. A large amount of work has been done on this property, but hitherto without any permanent developments being met with.

CONTENTION.—A few men are now employed cleaning out the shaft and other workings, preparatory to starting up simultaneously with the Grand Central, when the pumps are ready.

HARO UP.—Some assaying has been lately commenced here. This is one of the Corbin properties and was located in very early days.

LITTLE DEVIL.—Is being chloriding by Mr. Green and his partner Macdonald. Several rich veins have been found on this property, and at one time it was thought to be a veritable bonanza. It may prove so yet.

LESLIE.—Has been steadily worked for the last eight months by those energetic miners, Robinson and his partner. The result encourages them to proceed, and in the event of their making a success many prospects in their neighborhood will be set to work.

CONTACT.—This mine is now owned entirely by C. W. Leach, who has had some men constantly at work for months back. This was the mine backed by George Hearst and surrendered by him after the completion of a good deal of work. The present owner is, however, working on a different part of the claim.

COLORADO.

SILVER PLUME.—Colorado *Miner*, Feb. 11: Calvin Anderson & Co. lessees on the Atlantic mines on Brown Mountain, have a fine streak of high-grade ore. Their last mill-run returned for first-class 900 ounces, and for second-class 350 ounces silver to the ton. A shipment of ore was made last Friday from the Kilbride lode, on Brown Mountain, the returns of which we failed to glean. Dr. Robinson of Kentucky, owner of the Hardscrabble group of lodes, on Hanna Mountain, writes that he intends to start up work this spring on his properties. Work has been commenced again on the Pickwick lode, on Saxon Mountain.

IDAHO.

CLIMAX.—Wood River *Times*, April 8th: Herman Schaub, who has charge of the work in the Climax mine, opposite Lamb's ranch, about one mile west of Hailey's, was in town to-day with samples of ore for assay. He stated that he and another man had been working there since last August for Capt. Guyer, owner of the property, for wages. They shipped two carloads of ore last fall, which netted $3,500, but have never stoped any, all the ore sold having been extracted in doing development work. The tunnel is now in about 210 feet, and for over 150 feet of that length there is ore. The tunnel runs under the ledge, but small raises have been made at various points, to ascertain the width and quality of ore. The width has been found to vary from 6 to 24 inches of solid galena which assays over $100, and the ore improves in grade as the tunnel penetrates into the hill. As above stated the tunnel runs under the ledge, leaving the ore in place, as Captain Guyer's intention is to open up the mine, and not to realize on his ore beyond what is sufficient to pay the running expenses. But even now, if desired, several tons could be extracted per day.

THE COPPER KING GROUP.—Work on the long tunnel in the Big Copper mine, of the Copper King group, out Lost river way, has progressed all winter, and the header is now in over 300 feet. It has cut several stringers of good ore, one of which is over 3 feet in width. Recently, in cutting through a stratum of black oxide of copper, some native silver was found. All this proves the property to be enormously valuable, and as the owners propose to work it vigorously a few months more will doubtless suffice to show that the surface prospects were no blow-out, but genuine out croppings. Recent advices from G. L. Center, superintendent of the smelting furnaces operated in connection with the Copper King mines, state that he will return soon for a summer campaign. He is expected by the 1st of May.

THE HORN SILVER.—Frank Martin, sole owner of the famous Horn Silver mine, in Champagne district, arrived to-day from Salt Lake, where he has been for some weeks, making arrangements for the sale of his ore. Mr. Martin is an experienced miner, who deprecates the existing excitement and rush to the district. When he left the Horn Silver was only "prospect" (as he calls it), which shipped ore; but other discoveries may have been made since. As to his property Mr. Martin says that he does not yet know either its extent or value. In the shaft he has 2½ feet of 630-ounce ore, while the entire hillside upon which the Horn Silver is located seems to be milling ore. At any rate, there seems to be a width of 60 to 70 feet of that class of ore. W. H. Walker, who has charge of operations at the mine, is on the way with another load of ore for Salt Lake. When he returns the force at work will be increased, but Mr. Martin does not know how many men he will be able to work to advantage.

THE TRIUMPH GROUP.—The Triumph, Minerva and May Leaf claims, on the East Fork of the Wood river, have just been incorporated and sold to a joint-stock company, organized under the laws of Utah, with headquarters in Salt Lake City. The claims constitute what was known as the Triumph group, and owned by Domski & Hillebrandt. These men discovered them three years ago, and began opening them, taking out some $4,500 worth of ore. In doing this, however, they became involved in a few thousand dollars, and their mining bark stranded in the sea of litigation, until the debts and accruing costs amounted to about $8,000, Pinkham & Lewis, of Ketchum, paid off the claims, thus acquiring title to the property, and then interested Swift & Conklin with themselves.

THE NEW "LAVA" CREEK DISTRICT.—Three or four prospectors got in from "Lava" creek to-day, to record some locations. The new district is on Champagne creek, and is to be known as Champagne district. There is quite a rush to the new camp, over 100 persons being there already. The ledges have massive outcroppings, and are easily got at. The Martin mine has more ore in sight than the Minnie Moore and Queen of the Hills together. The Rattlesnake mine, adjoining is just as good. So is the Extension; also, the Last Chance. Some of the ore brought in by the prospectors carries an almost incredible percentage of horn silver, which can be cut with a knife. One chunk of five pounds shown the *Times* reporter must go all of $10,000 per ton, or $5 per pound.

MONTANA.

PHILIPSBURG MINES.—*Inter-Mountain*, April 8: Excellent reports are received from the Granite Mountain, good ore being abundant in all the workings. The mill is in smooth and successful operation, and Capt. Plummer, the new superintendent, is sanguine over the appearance of the mine. The bullion shipments are between $65,000 and $70,000 monthly. The Hope is in good shape. The annual report of Supt. Babcock, who is now in Butte, shows that there is enough ore in sight to last six months. The diamond drill has been used successfuly in searching for ore bodies. A total of 5,313 ft. of holes were bored, at an average cost per foot of $1.11½, and an average bored per hour of 6.36 ft. During the fiscal year ended September 30, 1884, 2,822 tons of ore were mined, at an average cost of $12.91 per ton; 3,136 tons, including custom ores, were milled and amalgamated, at an average cost of $6.35 per ton; average amount recovered, 16¾ ounces per ton of ore amalgamated; 2,573 ft. of levels, drifts, shafts, etc., were run, at an average cost of $15.69 per linear ft., and about 25 cents per cubic ft. The cost per ton of ore and waste removed is stated to have been about $3. Batteries in service 156 days; average ore crushed per stamp in 24 hours 2.24 tons; average capacity of pans per charge, 2,267 tons. Hope ores crushed, 2,840 dry tons; average assay value, 21.33 ounces per ton; estimated per cent of reduction, .75. Custom ores milled, 296 dry tons, assay value, 30.57 ounces per ton.

NEW MEXICO.

ORE.—Silver City *Enterprise*, April 10: A rich strike of chloride ore has been made in the Burro mine, at Fleming. A shipment of ore will be made from the New York mine at Lone mountain Monday. McCone & Keister of Gold Hill shipped 21 sacks of ore from the Maud S. mine last week. A carload of ore was shipped yesterday from the Rose mine. It did not contain much of the native silver or high-grade ore of the mine. An extensive strike is reported to have been made upon the Augusta mine at Fleming this week. The ore is being sacked for shipment. There is a fair prospect now that there will soon be a 10-stamp mill put in Gold Hill, as there are parties now in the East making the necessary arrangements. C. E. Conway recently sold a one-third interest in the Novelty claim at Malone to H. L. Pickett for $1,000 cash. The Novelty is a good claim. It lies between the Young man mine and the Walpies. The Flagler reduction works of which Col. H. H. Carpenter is manager, will commence operations within two weeks' time. The improvements to the old plan have been very extensive and complete. The Flagler reduction works will do for Silver City what the Billing works did for Socorro. A cross-cut has been run on the New York mine, at Lone Mountain, since it was purchased by Montgomery & Mitchell, that shows up a 22-foot body of excellent ore. It is said a mill will shortly be placed upon the ground and many miners put to work on the property. There have been several other large ore bodies uncovered in other claims in this camp by recent development work.

OREGON.

PROSPECTING.—Jacksonville *Times*, April 10th: A great deal of prospecting is now going on. Ingram & Dean of Willow Springs are cleaning up, with fair results. Jack Layton has a good supply of water at his mines on Applegate, and is doing well. Hardman & Chamness of Gold Hill have discovered what they think is a rich vein of ore not many miles from that place. Mr. Bowman, representing San Francisco and Baltimore capitalists, is prospecting the chrome mines in the vicinity of Riddle. J. J. Brown informs us that one Otto, who has been mining some distance below Grant's Pass, has done well this season. He picked up a few neat nuggets. Rube Jones has sold to Mr. Pratt of Myrtle creek one-half of his placer mining claim near Canyonville. J. A. Harvey informs us that the discovery made by M. L. Colvig, was on the left-hand fork of Foots creek, and is thought to be a rich one. The quartz seems to be very rich in silver and assays well.

UTAH.

STAR DISTRICT.—Southern Utah *Times*, April 8: Throughout the district the mines are looking all that could be desired, and considerable ore is being extracted. Take the camp all through and it presents a much livelier aspect than it has done for several years. In early days very little deep sinking was done, much of the ore shipped being surface ore; but at present the camp has undergone a radical change and depth is now the rule with results that have firmly established the camp as an ore producer. That Star District contains high-grade ore is beyond question, though like any other camp it comes in for its share of low-grade. The great difficulty the miner has to contend with here is the enormous and exorbitant charges for freight by the Utah Central Company. Wickizer & Co. have leased the Waukeegan. The vein is looking very favorable and is on the increase. Mr. Campbell is driving ahead with all his mines. He has a large force of men scattered throughout the district, more particularly in North Star. We hear but little of the Campbell works making any progress toward completion. If the owners were as anxious to receive ore as the miners are to ship we should all be happy. J. F. Brown is working an old prospect called the Buckhorn. He has recently struck a fine vein of ore in spar, assaying up in the hundreds. The pay streak, as far as exposed, shows about a foot. O. T. Clark is running a tunnel to tap the Monarch ledge. He expects to cut the vein in about five weeks. Jas. Barrett is working the St. Mary and shipping ore. This mine is an immense deposit of fair-grade ore, which is eagerly sought after by the smelting companies on account of its fluxing properties. Thirteen years' work has been done upon this mine and it is opened out in a sytematic manner. Wm. Martin is the owner of two of the finest prospects in the district—the Talisman and the Stalwart. The Talisman is a large quartz vein, assaying from 300 to 400 ounces in silver with a fair percentage in lead. A shaft is sunk 150 feet in the gulch. The vein is about four feet wide with a foot pay streak. Several other workings on the vein have been made, all showing up well. The Stalwart is a fine piece of property and would command a good figure. The principal working is a shaft down about 250 feet. Considerable drifting has been done on the vein, all proving the ore body permanent. The average run or ore produced will assay in the neighborhood of 400 ounces silver and about 20 per cent lead.

HORN SILVER.—The smelters at Francklyn have been blown out and 14 carloads of bullion, valued at $600,000, moved to market. Last Sunday night the old workings in the Horn Silver mine caved again, with a mighty crash. The cave caught no men, but it closed up the draft in the new workings so that as late as yesterday a match could not be lighted on seven in the new shaft, and several of the underground men were laid off. If the previous caves did not put an effectual kibosh upon the old shaft and works this one has.

REVIEW.—Salt Lake *Tribune*, April 11: There have been some showers during the week, but the apparently long-settled good weather continues. The movement of the metals has also been fair. The shipments out from Salt Lake for the week ending Saturday April 4th, inclusive, were 1,909,964 pounds. The receipts in this city for the week ending April 8th, inclusive, were $113,429.46 in bullion and $14,300 in ore; a total of $127,729.46. The total of the previous week was $85,409.25, of which $72,519.25 was bullion. The shipments of the Ontario for the week were 69 bars, of the value of $49,489.46; total for year, $483,634.23. The Horn Silver has made no reportable shipments since the 1st of January. The amount shipped since will be made known in due time. Silver Reef contributed $12,150 in silver this week to the country's wealth, of which the Christy sent four bars, $5,910, and the Stormont three bars, $5,240. The product of the Hanauer smelting for the week was 22 cars of bullion, $51,790. Ore receipts were $5,100 from the Martin mine, $8,000 from the Queen of the Hills, which seems to have resumed regular shipments after its season of trouble with the Miners' Union; and $1,200 from the Overman.

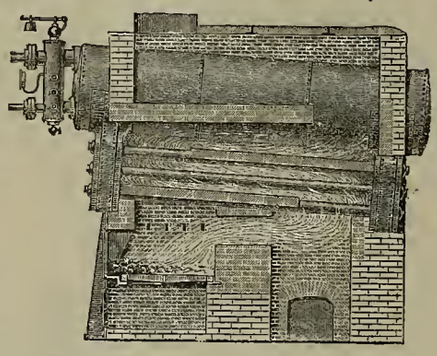
HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

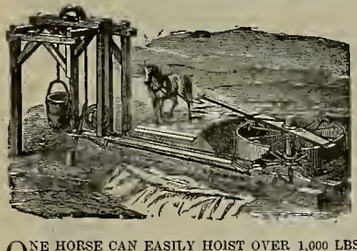
MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.
Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:
1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.
In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.
To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

A Glance Over the Mining Field.

Colorado has taken a step backward and passed a law taxing the net proceeds of the mines, much to the disgust of the mine-owners.

Mining matters in Arizona are rather quiet just now, but the mineral is there and it is only a question of time when the bullion output will be increased.

The northern counties of California are in the midst of a mining boom, and are attracting the attention of miners everywhere. Shasta, Sierra, Siskiyou and Trinity counties will show up many new prospects this season.

New Mexico mining affairs are quiet. More capital is needed in that region to properly develop the properties already found, and there is yet a large area hardly prospected.

Colorado miners are grumbling at the charges for smelting, and there are serious complaints at the management of the concerns at present monopolizing the business. There are smelters enough to handle the product, but the people are not satisfied at the prices made.

Quartz mining around Prescott, Arizona, is beginning to look up again after a period of depression. Six mills will soon be at work. They are: The 5-stamp mill which D. W. Frary is about ready to run in Walker district, 12 miles from Prescott. the Peck, 10 stamps, to be operated hy W. C. Dawes; the Del Pasco, 4 stamps, to be run hy Robbins and Gobin; the Big Bug mill, 10 stamps; the Conger, 10 stamps; and a 10-stamp mill on Turkey creek. Here are 49 stamps that will soon he dropping. A great deal of the ore to he crushed contains more gold than silver. There is, too, a probability that the Groom Creek mill, 10 stamps, will be set at work this summer, and the Prescott Mining Co., Mr. P. A. Craigue, superintendent, will, in about six weeks, have a 10 or 15 stamp mill crushing sterling ore.

The Neihart Camp, Montana, is at present a poor place for a working man to go to, but the outlook of the mines is said to he promising.

Cœur d'Alene, Idaho, has a population of about 3,000 and considerable gold is being taken out. Some $12,000 in nuggets were received a week ago at the U. S. Assay Office, Helena, from these mines.

It is thought that the Richmond Con. Works, at Eureka, Nev., will start up again hy the first of next month.

The low prices of copper are very detrimental to the copper mining intcrests of Montana and Arizona.

As we have stated in the PRESS several times, the miners are paying more attention to gold prospecting than ever before. Many of the Colorado districts are doing well in gold production, and hid fair to increase it. Our exchanges state that not only are the placers to he vigorously worked, but also stamp-mills are being rapidly erected, and an abundance of pay ore for their steady employment is assured. San Miguel county will this season turn out gold hullion second only to Gilpin county. Summit county will greatly increase her gold yield, and certain districts of Gunnison will pound out considerable gold. It is thought that Boulder will he a much larger producer of gold this year than for some years past. The most noticeable progress in this respect, however, is to be found in Lake county, which is given hy the *Herald* as follows: To-morrow morning the Oro mill, with 25 stamps, the First National mill, with 10 stamps, the Seven Thirty mill, with 5 stamps, and the Lilian mill, with 20 stamps, are to commence again beating gold out of ores from the mines of Printer Boy Hill. Sixty stamps running on gold is not a bad showing for a silver and lead district. As Leadville's mineral resources continue developing her gold production increases. Give Lake county's auriferous lode and placer mines an opportunity and the excessive product of the yellow metal will soon hring the intrinsic value of silver up to where it justly helongs.

News has been received at Eagle Pass, Texas, of the discovery of rich gold fields in the Santa Rosa mountains, about 100 miles west from Santa Rosa, Mex. The discovery was made hy the Davis brothers, who were working a profitable silver mine in the same range, but have abandoned their silver mines and located claims in the gold fields. The gold lies in quartz.

THE iron-works at Iron City, Utah, are likely to he removed to Cedar City at an early day. The cause for the removal of the works is that it will be a great saving to the company in the hauling of coal. If this is the case, the company have given up the idea of constructing a railroad from the furnaces to the coal mines.

The ore developments on the lowest levels—2,900 and 3,000—of the Hale, Norcross and Chollar mines, or the Comstock, are so far only first rate prospects, not bonanzas, hy any means. The ore on the 2,900 level is low-grade with some bunches assaying high. The whole mass will, however, pay for milling. The Virginia *Enterprise* cautions people against getting excited on the proposition, saying: "Bear in mind that there is a great wall of hot water a thousand feet high on either side and surrounding this new developmeut—that it is being made over a thousand feet below the surface of the aqueous impediment that so effectually floods and holds arhitrary possession of the lower levels of the Comstock, and that a sudden and unlooked-for inhurst of water tapped hy drift or crosscut can flood the little Hale and Norcross fortress and drown out the forlorn hope in spite of the great hydraulic pump. Meanwhile, this good and very encouraging development has infused new life into the Comstock community, and inspired renewed hopes of a return to former prosperity. It it turns out as well as is anticipated, these renewed hopes will hloom into tangible realities, and old works and new works will be started up again in all directions and all along the line. And most certainly the submerged lower levels will he pumped out, especially at the south nr Gold Hill end, and good prospects already developed before the hot floods hursted in will he again followed up—or down."

It is stated that after May 1st, hy means of the new trail now being made, the trip to New River mines can he made in one day from Weaverville, Trinity county.

AMONG the Lake Superior copper mines the Atlantic makes money with .75 per cent ore; the Franklin harely pays expenses with 1.78 per cent ore; and the Huron runs hehind on ore of 1.80 per cent.

P. A. CHALFANT, who for many years conducted the Inyo *Independent*, has started the *Inyo County Register*, at Bishop Creek, in that county. He makes a good heginning hy giving plenty of local items, including a good summary of mining news of the region thereahout. A local paper can do great good to the miners in its region hy keeping outside people posted on what is going on amoug them, and the publisher of the *Register* is evidently aware of this fact.

DR. ASA GRAY, the distinguished hotanist, is now in San Francisco.

Bullion Shipments.

Christy, April 7, $5,260; Stormont, 7, $1,950; Queen of the Hills, 7, $2,200; Hanauer, 9, $4,900; 10, $2,800; 11, $2,800; Vienna, 12, $2,000; Hanauer, 12, $5,200. Queen of the Hill, 12, $1,100. The banks of Salt Lake report the receipt for the week ending April 8th, of $113,429.46 in bullion, and $14,300 in ore; a total of $127,729.46.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 262 Market St., S. F.

FOR WEEK ENDING APRIL 7, 1885.

315,110.—WHIP-SOCKET, OIL-CAN AND WRENCH—C. L. Bard, San Buenaventura, Cal.

314,999.—HEATER—H. B. Chase, Portland, Or.

315,255.—STOVE GRATE—De Guerre & De Lano, S. F.

315,267.—WATER CARRIER—Jas. F. Fine, Lake, W. T.

315,141.—DRYING APPARATUS—O. B. Hardy, S. F.

315,287.—PIPE COUPLING—J. H. Hobart, Oakland, Cal.

315,143.—WHEAT BREAKER—Hudson & Tobey, Salinas, Cal.

315,152.—BURGLAR ALARM—Ira G. Leek, S. F.

315,044.—PACKAGE COMPRESSOR—Luce, Boole & Byron, S. F.

315,425.—INDUCTION APPARATUS FOR TELEGRAPHY—J. C. Ludwig, S. F.

315,426.—RHEOTROPE OR CURRENT REVERSING KEY—J. C. Ludwig, S. F.

315,427.—POLARIZED TELEGRAPHIC RELAY—J. C. Ludwig, S. F.

315,428.—GENERATION OF INDUCED CURRENTS FOR TELEGRAPHIC PURPOSES—J. C. Ludwig, S. F.

315,325.—CABLE GRIP—J. H. Parkinson, Bodie, Cal.

315,077.—WIRE ROPE OR CABLE—Thos. Seale, S. F.

315,096.—PUDDLING FURNACE—J. Webb, Alameda, Co., Cal.

315,195.—PASTE HOLDER—P. Weiss, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SUPPORT FOR CARRIAGE-TOPS.—Isaac L. Umstead, Ione City, Amador Co., No. 314,631. Dated March 31, 1885. This inventiou relates to the class of carriage-tops which are adapted to be raised and thrown back, and to certain improvements in the means for supporting them. It consists in a peculiar adjustable or extensible rod, one on each side of the top, journaled in its lower end on the arm of the shifting rail and pivoted at its top to the rear how of the carriage top; and it further consists in certain details of construction relating to an eccentric hearing on the lower end of the rod, its various adjustments, means for holding it when necessary and preventing rattling.

COMBINED WHIP-SOCKET, OIL-CAN AND WRENCH.—Cephas L. Bard, San Buenaventura. No. 315,110. Dated April 7, 1885. This is an invention in which the oil-can is secured to the hase of the whip-socket, and the wrench is secured to hoth, the combined device heing adapted to he secured to a vehicle. It consists in such a union of parts as will permit the ready separation of onc from the other, and especially of the wrench from the whip-socket and oil-can, without disturhing the attachment of these latter to the vehicle. It further consists in a modified construction of the top of the wrench, whereby it may serve as a wrench for small nuts, a rein-holder or a hoof-cleaner.

PIPE COUPLING.—John H. Hohart, Oakland No. 315,287. Dated April 7, 1885. By the use of this coupling the length of the pipes may he raised, and at the same time the direction of the pipe may he changed. It consists of two lengths of pipe, the ends of which approach nearly to each other, an exterior sleeve of larger diameter having flexible annular parting rings at each end, through which the first-named pipes pass, and within which they may move and turn without causing leakage.

MACHINE FOR BREAKING WHEAT.—Harry Hudson and Miles Tohey, Salinas, Monterey Co., No. 315,413. Dated April 7, 1885. This is a machine for hreaking wheat preparatory to crushing or grinding it to flour, and the object of which is to remove from the grain what is known as "crease-dust," which is in the seams. The object is to hreak the wheat clean and sharp, wherehy the crease-dust, a portion of the outer hull or hran, and the germs are separated, and to expel the grain from the machine as soon as hroken, wherehy it is not liahle to he too much hroken and little or no hreak-flour is made, as is the case with the machines at present in use for this purpose. The new machine comprises a rotating disk having upon its rim a narrow annular band of teeth, a central feed-vessel with intervening feeders on its surface, adapted to feed the wheat from the center-vessel to the teeth, a stationary vessel or cylinder placed above the rotating disk, and having a notched or corrugated surface on its hottom rim, hetween which and the teeth the grain is caught and hroken, and an encircling band or hoop guarding the apertures formed hy said notched surface, to prevent the grain from discharging directly, and to cause it to fall between the teeth.

THE swarm of hugs around some of the electric lights at Stockton has become so great a nuisance that the City Trustees have held a meeting to consider the removal of the masts to other localities.

Market Reports.

Lumber at Wholesale.

There is a fair trade in lumber, but no special changes in prices. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $39; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, h m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 refuse) do do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and ¼x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates—Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.20; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱ M ft, $33.50; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $29.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.50; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1-¼inch, ₱ M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

Pine—Rough, $14.00; No. 2, $11.00; do do in lengths, $12.00; rough, 40 to 50 ft lengths, $15.00; do 50 to 60 ft, $10.60; T and G Flooring, 1x6, $25 00; do do 1¼x6, $27.00; do do 1x4, $27.00; do do No. 2, $20.00; Vertical Grain T and G Flooring, 1x6, $28.00; do do do 1¼x6, 1x4, $30.00; Stepping, $35.00; Furring, 1x2, per lineal ft, 1c.

Redwood—Rough, $16 00; No. 2, $12.00; Surfaced, $30.00; do, 1x8, $28.00; do, 1x6, $28.00; T and G, 6 in. 12 ft and over, $28.00; do do, 7 to 11 ft, $25.00; do do, under 7 ft, $20.00; Rustic, $30.00; do No. 2, $25.00; T and G Beaded, 12 ft and over, $30.00; do do, 7 to 11 ft, $25.00; do do, under 7 ft, $20.00; Siding, ½ in, $22 50; Picket, fancy, $25.00; do, rough pointed, $15.60; do do, square, $14.00; Battens, ½x3 in, per lineal ft, ¾ c.; Shingles, $2.00; Laths, 1¼, $3 25; do 1½, $3.75; Dunnage Boards, less 5 per cent, delivered, $10.00.

Nails.

We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.90: 8d and 9d, $3.00; 6d and 7d, $3.25 4d and 5d, $3.50; 3d, $4.25; 2d, $5.50

BARRELS.—¾ inch, $0.75; ⅞ inch, $5.75; 1 inch, $5.25; 1½ inch, $4.50; 1¼ inch, $4.25; 1⅜ inch, $3.75; 1½ inch, $3.50.

LINING.—⅝ inch, $7.25; ¾ inch, $2.75.

TOBACCO.—10d, $3.25 8d, $3.50; 6d to 7d, $3.75.

CLINCH.—6d to 30d, $4.50.

SLATING.—5d, $3.75; 4d, $3.75; 3d, $4.50; 2d, $5.75.

FINISHING.—2d, 1 inch, $8.75; 3d, 1¼ inch, $6.75; 4d, 1½ to 1¾ inch, $4.50; 6d, 2 inch, $4.25; 8d, 2½ inch, $4.00; 10d, 1 inch and over, $3.75.

CASING AND BOX.—10d to 30d, $3.50; 8d, $3.75; 0d, $8.00; 4d, $4.25; 3d, $5.25.

FINE BLUED.—4d, $4.50; 3d, $5.75; 2d, $6.75

CUT SPIKES.—All sizes, $3.00

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Material.

Lime, per barrel, $1.50@$1.60. Plaster, $2.75–3.00. Eastern Plaster, $3.00–3.25. Roscndale Cement, $2.10–2.25. Portland Cement, $3.50–3.75. Fire Brick, per 1,000, $30 @ $40, according to brand; hard, $9.00; red, $8.00; soft, $7.00@7.50; face, $25.00.

Mining Share Market.

The transactions in mining shares have reached larger proportions than has been the case for some years. The market is quite active and fluctuations marked. The favorites seem to be the middle and north-end stocks. The Hale & Norcross and Chollar developments are supposed to be the cause of the activity. Concerning this ore the Virginia *Enterprise* says: But it is hardly safe to pronounce it a "bonanza" as yet, or anything more than a first-rate prospect. The ore as developed on the 2,900 is simply low-grade, containing streaks and bunches of rich ore giving very high assays. Even the management and those best posted only claim that the whole mass of the vein will pay well for milling, even from that great depth. If it holds out and increases in extent and richness at a greater depth, then and not till then can this new and important ore development be called a bonanza in the Comstock interpretation and acceptance of the term:

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Roissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 252 Market Street. Elevator, 12 Front St., S. F.

New Book on Assaying Gold & Silver Ores.

BY C. H. AARON.

For Practical Workers. $1

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of m n .

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

N B. This is Part I of three volumes on assaying by the same author. To be followed by Part II—Gold and Silver; Part III—Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS. S. F

Mining and Scientific Books.

PUBLISHED OR ISSUED, WHO. SALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise description of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free.

PRACTICE makes perfect; 35 years experience; Muller, the Optician, 135 Montgomery street, near Bush, opposite Occidental Hotel.

NEARLY READY.

A New Revised and Greatly Enlarged EDITION OF

NYSTROM'S MECHANICS.

BY JOHN W. NYSTROM, C. E.

The NEW EDITION has been enlarged to the extent of 200 new pages, 150 tables, and 251 illustrations. This revision brings the book up to date and adds additional value to this indispensable work for the mechanic, engineer and scientist.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

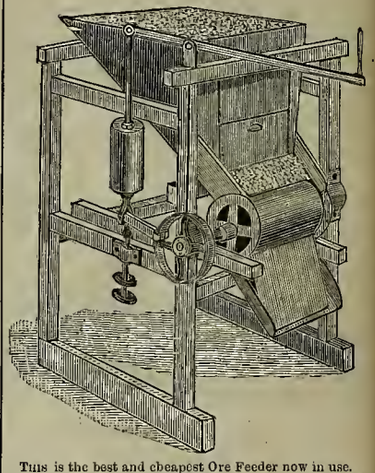
THE ROLLER ORE FEEDER
[Patented May 28, 1882.]


This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

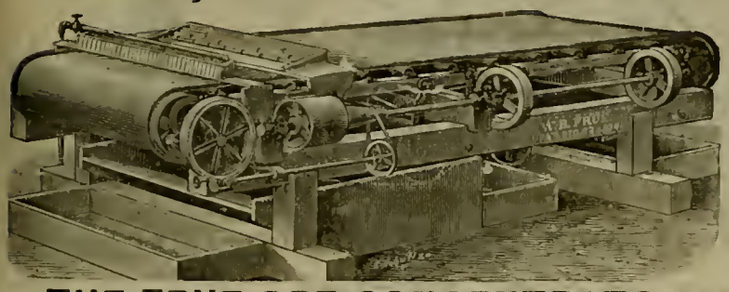
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

Baker's Mining Horse Power.

Possessing all the requirements of a first-class hoist, and affording means for the continuous operation of Pump or Blower, without interfering with a hoisting apparatus. It is made entirely of iron, no piece weighs over 300 pounds. At the ordinary speed of a horse, a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting-drum is under the complete control of the man of the shaft, and is capable of carrying 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

HOISTING WORKS.

DIVIDEND NOTICE.

Beaudry's Upright Power Hammer.

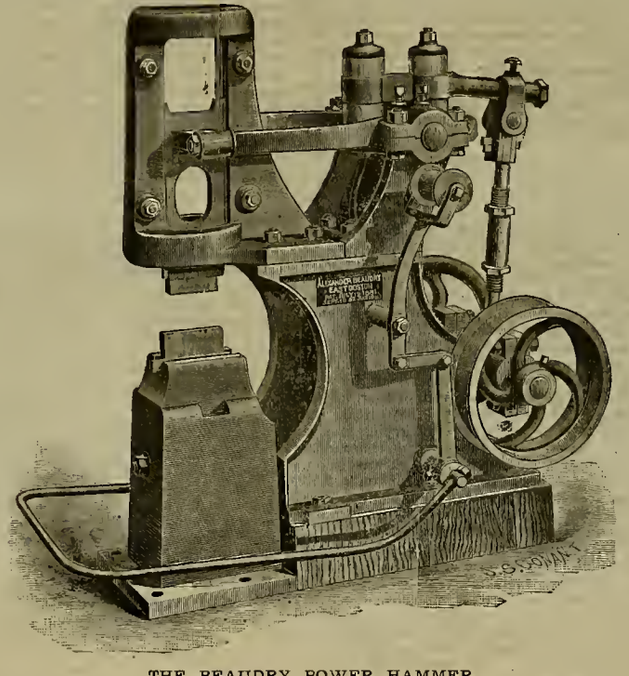
The engraving on this page illustrates the new design Beaudry upright power hammer, which is intended for all kinds of steel and iron forging. It will not only rough out work, but completely finish it, doing trimming, cutting and punching.

A main feature is the arrangement by which the elastic force is given to the hammer. The seat of this is the pitman, on which are placed the heavy rubber springs which give the "snap" to the blow, and which are locked up with bolts so that they do not wear. These strong springs, which are the best that are manufactured, and are made especially for this purpose, have a power which is second only to steam, and give force to the blow, while at the same time yielding so as to prevent concussion. The steel arms also have a vibratory motion sideways, which adds to the weight of the blow.

A most important feature of the working part of the Beaudry hammer is the leather band which passes through a slot in the hammer head, and connects the head and arms together. It is a band of tough raw-hide leather, of three to five inches wide, six times folded, and strongly bolted together. It is found to be better than steel or iron, or any other material which could be used. It is a much more durable article, and while superior in point of strength to anything else in such a position, has the inestimable advantage of being elastic, so as to carry off all jar and concussion. The hammer can be run very economically, the manufacturers stating that the cost of running need not exceed 25 cents per day, while a steam hammer of the same size could not be run for less than $1.75 or $2 per day, besides the necessary help.

No help is required to run this hammer, as would be needed in case of a steam hammer; the smith runs it by simply pressing his foot on the treadle, which extends around the bed, and he can do this equally well, whether standing in front or on either side. The person working the hammer has complete control of it, and can easily regulate the pressure to be applied. The Beaudry hammer has the advantages which a steam hammer of its size, or perhaps larger, have; and, in addition, no pipes or cylinders to freeze in cold weather. At the same time it can be used without alteration for lighter work, such as tool, knife and implement making of every kind, and also for drop work.

The expense required for repairs is so slight as to be inappreciable. This durability is accounted for by the elasticity, previously spoken of, which exists in the rubber springs, the arms and the leather band. These three points provide for and prevent the wear and breaking which must otherwise occur in a machine subjected to such violent shock. These hammers are adapted to almost every kind of forging, from the smallest knife to a five-inch bar of steel or iron; or, indeed, for anything up to the point where a large steam hammer is needed. They are made in all sizes from the smallest upward. Every hammer is carefully tested by actual work before being delivered. The anvil is entirely separate from the frame, relieving the frame and the entire hammer from the jar and strain. When the pressure is removed and the hammer stops, the head always remains up, leaving a space of from four to twelve inches, or even more, between the dies, so that it is again ready for immediate use. The blow is a direct upright blow, and is given with the same elasticity as by a blacksmith's arm, and thus does not chill the work. It can be so nicely graduated as to strike with a force of from two ounces to two thousand pounds or more, and this can be done instantly, without any alteration. The stroke can be changed from a short stroke to a long one by sliding the regulator back or forth. The connecting rod is made adjustable with a turnbuckle, so that the ram can be raised or lowered by this means, if necessary. The head does not vibrate, as it is secured in vertical guides, which are made in two pieces, with wood inserted between them, so that if there should be any wear or slack, the wood can be shaved down a little, which will take up the slack. These implements are useful to manufacturers of all descriptions, railroad shops, steel and machine forgers, cuttlery makers, agricultural implement makers and all others who need such tools. The agents in this city are Messrs. Morris & Varney, No. 24 Fremont street.



THE BEAUDRY POWER HAMMER.

Montana Mines.

We had a conversation this week with Mr. N. A. Foss, who has been a resident of Montana some years, and who has been engaged in smelting operations in that Territory. He speaks of Butte as the greatest mining camp of the United States, but says the low price of copper has been and is detrimental to its interests. Moreover, as the mines are deepened not as much silver is obtained as nearer the surface. It is his opinion that Montana mining interests will never be as prosperous as they should until the rate of wages is lowered. They are just as high now as five years ago, while the necessities of life are much lower in price, being brought in by the railroads. The high rates of transportation are also injurious to the section, and these must in time be lowered also. Should wages continue as at present, and transportation rates as high some of the smaller works will have to close, and the copper mines will go more into the hands of the larger concerns. The Butte ores are very easily worked, but with the present conditions, and low price of the product, little or no profit can be made.

Mr. Foss says times are just now dull for Montana, as they are elsewhere. A great many people are coming in all the time, in fact, more than can get work. There is a heavy immigration this spring and the trains are crowded, though many are going through to Oregon and Washington. He says *good* miners can always find work. There are numbers of men there who have previously done little or no work in the mines, and experienced men are in demand. At Maiden, for instance, good miners are scarce.

Our informant does not express a very high opinion of Montana farming resources. It is too cold a country for very successful farming. The main dependence is on mining, cattle and sheep. The farmers used to get high prices for their products, but the railroads have stopped that and can bring it in cheaper than it can be produced in so cold a region. There is little sale for farm products when competing prices are considered.

The American Institute of Mining Engineers will hold its forty-third meeting at Chatanooga, Tennessee, beginning on May 19th. No special railroad facilities are offered on this occasion, as nothing better could be secured in this respect than the rates now ruling in connection with the New Orleans Exposition.

The miners on the Klamath are all busy rigging up wheels, derricks and pumps, and getting out material for wing-damming. The season opens early and will be one of the most profitable yet employed by river miners.

Mining assessments falling delinquent in April amount to $133,000, of which Nevada mines want $66,000 and California $67,000.

New Ore-Crushing Rolls.

Wm. E. Wild, of this city, has patented, through the Mining and Scientific Press Patent Agency, an improved ore-crusher of that class on which heavy rolls are used. The main frame is made of heavy timbers and a fixed roll is placed in suitable boxes at one end. This roll is driven by pulley and gears in the usual way. A yielding or movable crushing-roll is also used. It has been customary to drive the roll by gearing it direct to the fixed roll, and in order to provide for its various changes of position the teeth of the driving gears are made of some length. The objects of Mr. Wild's invention (in which Mr. George E. Ames is interested) is to provide a separate sliding frame and driving mechanism for the yielding roll, whereby the wear and tear on the machine, and especially the gears, is reduced, and also to provide a means for adjusting the movable roll and for receiving the sinking pressure of the sliding frame.

On the main frame are fixed guide tracks, on which is mounted the sliding frame. In this frame is mounted the shaft of the movable roll and also the shaft carrying the driving-pulley and pinion which meshes with the master-gear. These constitute the driving mechanism of the yielding roll that is independent of that of the fixed roll. Being on the sliding frame all these parts move together, and the variation on the driving-belt caused by its movement is so slight as not to be of consequence.

There are four bolts, two of which lie above the sliding frame and two below. The heads of these bolts are firmly secured behind suitable brackets on the main frame, and their ends extend beyond the sliding frame and carry a plate which is held by nuts on the bolts. Between this plate and the end of the sliding frame is an elastic cushion, preferably a rubber buffer. The cushion is carried by the plate, and receives the backward motion of the sliding frame and forces it forward again to keep its roll to its work. By setting up the nuts on the bolts the sliding frame, with its roll, may be accurately adjusted and all the working pressure of the frame and roll is borne by the plate and bolts, whereby little or no strain is brought on the main frame.

The resisting-plate is made the weakest part of the machine in order that under great pressure, as where work is very hard, or some hard foreign substance forces its way between the rolls, it may be the first to break, thus saving other and more important parts of the machine.

The operation of machines with crushing rolls is well known. The ore is free down between the heavy rotating rolls and is crushed by them. One of the rolls yields slightly to prevent choking and breakage of any parts. By Mr. Wild's improvements each roll is driven by its own mechanism, and the machine is compact and strong. In localities where the rock is not very hard and there is no necessity of having the rolls to yield, it can be made rigid by substituting a block of wood for the elastic buffer.

Fifty-three gold deposits, amounting to 13,030 ounces, were made in the Helena U. S. assay office for the year ending March 31, 1884. For the year ending March 31, 1885, 169 deposits were made, amounting to 23,507 ounces, showing an increase over 1884 for the same period of 10,477 ounces.

Cleveland is the name given a new mining district recently discovered in Mono county.

CORRESPONDENCE.

New Mexico.

Black Hawk District.

[From our Traveling Correspondent.]

The camp of Black Hawk lies near the foot of Bullard'e peak, Grant county, about 18 miles weet of Silver City. The place has produced a great deal of bullion. The recent renewal of work on the deepest mine in the camp, and the discovery of rich eurface deposits have given an impetus to tbe mining interests and a general activity to a more thorough work in prospecting. Tbe great depth attained by some mines and tbe existence of ore in well-defined veins 550 feet deep, indicate most forcibly that tbe place can be relied upon as a deep mining district. The surface development of many properties have produced some wonderful deposits of native silver. The entire district has been taken up and mining men of experience are investing in all the property they can secure. Regular shipments of ore, a majority of which will run over 300 ounces to the ton is the order of the camp's output. The following mention of the leading and most extensive developed mines will give the readere of the PRESS an idea of tbe camp's prospects as a future hullion producer.

The Black Eawk is tbe pioneer mine of tbe district. To its discovery the camp, district and the many makings of mines in this vicinity owe tbeir existence. This property is entitled to the distinction of being a mine in every sense of tbe word. The marveloue deposits of sulphide and native silver taken from tbe property as surface development and depth was made caused it to be epoken of among miners as "the solid silver."

Formations and Ore.

The formations are syenite and porphyry, tbe latter appearing in dykee cutting the veine in singular and perplexing shapes. The ore bodies occur in pocket and cbimney-like deposits, always near the porphyry. Sulphide and native silver, especially tbe latter, is the "stuff" found in these deposits. The dip of the vein from the surface for a depth of 100 feet is perpendicular. From that depth to the 500-foot level the incline is 45 per cent to a fraction. Ore bodies, some of which were nearly solid native silver, were uncovered quite frequently from the surface to a deptb of 225 feet. From this depth to the 325-foot level the vein proved to be entirely barren. From the level the vein appeared to widen out into a large broken stratified body eome 20 feet in width, and no deposits were found, notwitbstanding a thorough development of the "busted" body was made to the 500-foot level.

New Discoveries.

At a depth of 500 feet an east drift was made to determine the length of tbe break-up of tbe vein. In the progress ot this tunnel a vein was cut, the conrse of wbich is nearly parallel with the Black Hawk vein proper, and is some 30 feet from the same. The existence of this vein was unknown heretofore, and the discovery of rich ore deposits in the same indicate a renewal of the output of by-gone days. This new vien, and the discovery of the Black Hawk vein proper in a more firm shape in tbe 550-foot level, would be sufficient encouragement to a California company to go down deep on the Black Hawk and up to the surface on tbe new vein. High-grade ore is heing taken out of tbe rediscovered vein in the 550-foot level. With two splendid mineral-bearing veins at such a depth the management will staud in their own light if they work tbis property in the we-muet-take-out-the-money-in-advance-to-work-tbe-mine plan. The ores of the dietrict are, with few if any exceptions, found in pockets, these deposite occurring near porpbyry. This mine now has two veine; their present development ie near a porphyry dyke. The dip of the veins do not justify the belief tbat tbey will emerge one into the otber unless it be at a great depth, or by a sudden change in the course of one or the otber a little deeper. If these veine concentrate below thie, and the deposits continue to oocur, the deep mining qualities of the dietrict will be an aseured fact and the exteneive workings of the many rich surface properties will speodily commence.

How the Mine Is Worked.

Tbe management of the property is in the hands of H. H. Rich, who is vice-president and a ebareholder of Black Hawk stock. The superintendency of tbe mine devolvee on I. L. Merrill, a practical miner—a man of much experience and knowledge of tbe many peculiarities of the mineral-bearing formations of tbe dietrict. The great depth of the mine has necesitated the placing of an engine at the end of the 250-foot north-east drift on the 500 foot level. This engine is run by steam, conducted from tbe eurface by pipes, and ie used in hoisting ore and rock from the 50-foot incline eunk on the rediscovered Black Hawk vein. The ore and water tubs are transferred on care to the foot of the main shaft and hoisted to the surface without change. The etopes and drifts, either in search of ore or in their extraction have been intelligently directed and every detail of the development of the property looked after in a manner that should win for Superintendent Merril the approbation of the company, as it certainly does the approval of the mining men who have seen the underground workingo f this property.

Eaetern Capital Invested.

The majority of the stockholdere of the Black Hawk are Eastern men; hence the timidity exhibited in the past workings of tbe property. The recent development may spur them up to push tbe work. H. H. Rich, general manager, is one of Grant county's prominent mining men and if he is not instructed to test the property fully and extensively, it will be because retrenchment is desired for the purpose of bnying up stock. Tbe developments recently made and tbe good indications for the future as they exist to-day in the Black Hawk would, if they appeared in some mines, boom the stock and insure more extensive development.

The Rose Mine.

Black Hawk's present activity and the prominent attention the camp is receiving from mining men and capitalists is principally due to tbe recent developments in this mine. The history of tbe mine'e location, the litigation and numerous claimants of the ground show a general knowledge of the richness of tbe ground. The mine is 600x1200, is one mile west of Black Hawk, and is owned by Colorado and Minnesota capitalists.

The Formatione and Ores.

The formatione of tbe Rose are peculiarly her own. The early history of the mine tells of four locations being made on tbe eame ground by ae many different claimants; a claim upon a claim, ae it were. Two well-defined mineral producing veins cross the mine; a mine witbin a mine, as it were. The course of tbese veins is such as to cnt across each other nearly forming the letter X. Strange as it may seem, they both dip in tbe same direotion, the highest one on the hill baving a dip of about 47 degrees, while tbe lower vein is nearly perpendicular. Tbe ore or vein matter of the upper ledge is a redish sedimentary matter lying on a solid, well-defined porphyry foot-wall; tbe country rock being eyenite and at times a porphyritic shale. The pay streak varies in width from six to 24 inches; at times taking a more solid formation, running wonderfully high in cbloride, sulphide and horn silver The ore in the lower vein is principally spar, from 15 to 30 inches thick, laying between porphyry and granite, and running bigb in native, horn and occasional streaks of ruby silver.

Development.

Vice-president R. H. Wellington, as general manager, essisted hy E. M. De La Vergne as superintendent, directs the progress of development. To tbese gentlemen their associates owe a debt of gratitude for so speedy a return of their investment and an economical, progressive management of this excellent property. Open cuts about 10 feet deep on both veins have exposed the ore from tbe gulch on tbe west over and across tbe hill to the bed of the canyon on the east. An incline sbaft at the summit of the bill, on the upper vein, is down 35 feet on ore. On the lower vein a 60-foot tunnel in the west gulch has followed a rich vein of spar, and at the breaet of the tunnel tbe pay-etreak bas widened to a 16-inch spar vein carrying native silver. Directly over tbe breast of tbis tunnel tbe same native eilver-bearing rock was taken from the open cut. In the east canyon a tunnel has been started to tap the incline, now down 35 feet on tbe upper vein. Tbis tunnel will tap the incline at a depth of nearly 75 feet. Sedimentary vein matter tbat runs 205 ozs. is beiug taken out of the open cut in wbich tbe tunnel is to start. From many places in tbe open cuts that mark the course of the veins across the Rose ore hae been extracted that runs eo high in native and horn silver, as to be almost incredible. Tbe expenee of development eo far has been very emall. The first carload of ore ehipped from the Rose wae valued at $20,000. The present management bas had charge of the mine eince March 6, 1885. A month'e work that will bear comparison in labor accompliehed, output in ore, and economy practiced, will be entitled to a like praise and emulation by mining managers and superintendents.

The Management.

The Roee is owned moetly by Colorado people. Dr. N. S. Culver, of Colorado Springs, president; R. H. Wellington, of St. Paul, Minnesota, vice-president and general manager; E. M. De La Vergne, euperintendent; Geo. R. Buckman, secretary; John Kerr, treasurer. Col. De La Vergne, aleo of Colorado Springs, is a large stockholder and one of the directors of the company. Tbe officee of the company are at Colorado Springs, Colo. The names and addreeses of tbe owneree are given merely to ehow that Western capital is coming to the front in purchasing and developing first-class mining property in a legitimate, bueiness like manner. The richness of the Roee, and the indicatione of a continuance of her phenomenal output of high-grade ore, make it more than likely that no stock will be sold, notwithstanding the organization of the company and the preparation of the stock for the market.

Concentrates.

A daily stage line connects Black Hawk with Silver City, distance eight milee, for $12.

Minere' wages are $3 and $3.50 per day. Board, $7 per week.

Two cars of ore evory 30 days are the Black Hawk's shipments. These cars return from $4,000 to $8,000 per car.

Assayer Edgar M. Hand does the assaying for the camp. He ie a rising young metallurgist.

The Blue Belle, with but little development, has produced $9,000.

The Silver King showe native silver as work progresses. They are now down 75 feet.

A miners' skating rink estahlished here seems to keep them from saloons and gambling houses.

Colorado capital is tho most heavily invested hereabouts. California, however, is crowding in and obtaining a good foothold in this excellent district.

Minnesota and Illinoie capitalists, judging from the number interested hereabouts, know when they get into a good locality, even if they do push development with a tight breecbing.

Western mining men in this camp who go ahead on good indica ions and investigate a mine for everytbing there is in it, bave been, and will continue to bs succcessful.

F. W. S.

Sierra County, N. M.

[From Our Traveling Correspondent.]

This is the haby county of the Territory; being formed from ricb and liberal slices of the counties of Socorro, Dona Ana and Grant. The birth dating in March, 1884. The taxes are two per cent and the assessable property for the year is over $2,000,000. Mining and stock-raising are tbe leading and in fact tbe only industries; the former being tbe leading.

Principal Districts.

Lake valley is the principal southern district of the county. A good-eized mining camp bearing tbe same name as the district, is located at the terminal of a branch of the A. T. & S. F. twelve milee distance from Nutt on the main line. Here are located the Sierra Grande mine, also the Sierra Bonanza claims. The former mine is owned by Philadelphia people and tbe great wealth it bas produced and tbe thousands it has cost the quaker and other Eastern stockholders has given the Sierra Grande a standing that belies the old saying, "out of sight out of mind."

A Wonderful Mine.

Tbe Sierra Grande consists of four claims. A 20-etamp mill and a concentrator adorn the grounds. Tbe mill is the Boss process, with wet pan amalgamation. The ores lie in small and large heds nearly flat, varying in thickuess and in richness; the composition being iron manganese heavy in chlorides. The free milling ores of the mine do not predominate, hence tbe heavy ebipments to Pueblo. The ores run from $10 to $2,000 per ton, the latter grade not being so frequent of late; the surface workings resemble an old iron quarry. Occaeional deposits of wonderfully rich ores gave tbe property a reputation very much like the fahle of "Aladdin's lamp." The marvelous richnese of tbe "Bridal Chamber" of the Sierra Grande, a deposit of ore but 30 feet helow the surface, from which over one and a quarter millions was taken, is still fresh in the minds of minere and mining men of the Coast.

Big Ore Shipments.

During the brisk days of tbe Sierra Grande'e prosperity a regular shipment of from 250 to 300 tons was not an unusual occurrence. As high as 600 tons was dispatched from the minee in twenty-four hours. At preeent this property is working with a reduced force and the air is full of rumors about Lake valley as to the ceuse of the discharge of over 100 men on the 1st inst. The past record of this mine has demonstrated the fact, at more timee than one, that the management of a mining property by Eastern meu is not as often a euccees as when handled by a Western man. Like all mines which depend on the high price of their stock to enrich the "inside" and gull tbe credulous, the management declines to allow the press or public accees to the mine.

False Economy.

The recent reduction of the force of the Sierra Grande mine, hy letting over 100 men go is, eo the Lake valley office says, a Quaker notion that the eame output can just as well be had with less meu. The general manager and his superintendents and officials, I am told, draw a princely salary (this is generally the caee with stock companies' mines). Special trains over the branch are the order of thinge when the management desires to go East or West or is returning home from such trips. Of course this is none of the stockhoders' husiness unlees they have to pay for it. To a practical business man it certainly looks as if a reduction in exhorbitant salaries, extravagant expenditures and the erection of eome feaeible and suceeseful machinery for the treatment of ore would result in an incrcase of output and a more frequent declaration of dividends. The freight paid out would in a short time pay for the erection of machinery for the treatment of ores.

The Sierra Bonanza.

The claime of this company adjoin the Sierra Grande on the north. The litbograph menu-like prospectus of the company, recently issued from the New York office of the company, reads like the first chapter of a dream of love or the realization of a "Monte Christo." A Philadelphia mining paper says: "We sacrifice all false delicacy (as to heing influenced) and for tbe first time officially endorse all that bas been previously published in these columns." The paper then predicts a future for the company, that if true, would canse the management to gobble up all the stock and freeze out every mother's son of a stockholder that beld a share in tbe property. Owing to a disinclination of stock mines in this viciuity to admit representatives of coast mining papers, in search of facts and informatiou on legitimate mining and mining methods, tbe Sierra Bonanza's property was not visited. Its proximity to the Sierra Grande justifies its dream of future millions on the Grande's past record of occasional strikes. This mine, as well as all others like it, will pay to invest in as follows: Bny 'em when they are low and sell 'em when tbe're high.

Hillsborough.

Eighteen milee northerly from Lake valley are the placers and quartz mines of Hillsborough. The placers are ricb, but not extensively worked on account of a scarcity of water. The gold and silver ores of the district are more or less worked, and in mauy cases produce bullion in paying quantities. Over $300,000 bas been sbipped from tbe mines of tbis district. The ores are both milling and smelting, the former predominating. A 10-stamp mill produced $22,000 in a four montbs' run. A dry-crushing process is necessary, by whicb it is estimated from $20 to $90 per ton can be saved from the minee of tbe district. The ores carry a great deal of pyrites of iron. The wet-crushing process is not a success owing to tbe existence of more or less manganese and some of the ores requiring roasting.

The Mines.

The most extensively developed propeity is the Compromise, Nos. 1 and 2, owned by Hopewell, Cosgrove & Co., Hon. N. Galles, superintendent. Some 2,000 feet of development has resulted in enhancing the value of the property and opening up tbe mineral-producing ground quite extensively. Tbe vein matter is about nine feet wide, the pay-streak averaging three feet in width. Three thousand tons from this property averaged over $10.50 per ton, by a treatment which failed to save the percentage that the dry process would have saved. The Bull of the Woods, owned by O. F. Gentz, runs over $85 per ton, the greater part of which is gold and silver. There are numerous other mines bereabouts that are equally as good, and the erection of the proper methods of treatment and a local market for ores is all that is necessary for the future prosperity and wealth of Hillsborough.

Kingston.

This camp lies 12 miles north of Hillsborough, the county seat. For a camp with an unusually bright future, very little is heard of it outside of ite immediate vicinity. There are two good and sufficient reasons for the meager advertising Kingston gets. First: If the actual facts were told of the mines about the camp, they would read too much like a romance to be believed hy the capitalist or mining man of ths Coast, and to the tenderfoot of the East the information would smack strongly of a prospectus of a district etock company, wbo offered thousands for as many dollars. Second: There are a number of mine-owners and companies in this district who, for good reasons, desire sileuce verging on a dense ignorance about ths mines of the district. In the "sweet by and by," when the poor miner has been bought or froze out sufficiently and a quantity of high-grade ores running from 200 to 1,000 ounces and upwards, sufficient to pay for all the property and labor of theee "black cappers" to the camp's prosperity, and these ehipments are made at the ratee paid on 100-oz. oree; then will Kingeton's merits ae a mining camp become known. The probahilities are that the information, at that time, will be a costly one to hoth outside capital and dealers in the stock companies that promisc to epring up here in the futurc.

The Formations.

The geography of the Kingston dis'rict is very much like that of the foot-hills of the Sierras. Towering pine-trees, running water and a permanent and regular mineral belt completes all the requisites of a desirable mining district. Tbe contact lies between porphyry and lime, and in some placee shale taking ths place of porpbyry. There are no fissures, the vein matter occuring in large or small hodies in the lime. Iron mangauesc, chloride and sulphide of silver carrying eome copper and lead conetitute the ores of the immediate vicinity. The place is a bona fide high-grade camp. Anything less than 100-ounce ores are deeignated as low-grade. There is a diversity of opinion among mining men as to there being a efficient per cent of lead ores in the district to smelt the dry ores. Time, and the development of the propertics carrying the moet lead, only will settle thie dispute. At present lead ores are being hrought in from other districte, and in some instancee from Old Mexico. There is hut little free milling ore in the Kingston District.

The Minee.

There are a dozen or more regular bonanza mines. Some of these minee were bougbt for a mere song, ae it were; others were honded for thousande, and the money with which they

(Concluded on page 270.)

Mechanical Progress.

Steel vs. Iron Nails.

Notwithstanding the bitter opposition to them, steel nails seem to be rapidly winning their way into general use. What one of the labor papers terms the "vigorous boycotting" of the steel nail by the carpenters and contractors of Wheeling appears to have had but little effect, as the demand upon the nail-mills in the Wheeling and Pittsburgh districts is almost exclusively for steel nails. The iron nail mills in those sections do but little work, and even the mills that make both steel and iron find that their steel nails move off freely, while for their iron nails there is scarcely any demand. As a result of this steel nails are being made in increasing amounts, and even those mills which have heretofore refused to make steel nails, or have made them but sparingly, are making arrangements to very largely increase their product of steel.

A California view of the nail question is expressed by Geo. T. Walker, of the Pacific Nail Company, in a recent interview with a *Bulletin* reporter, as follows: "Steel nails are drifting into use, and for some purposes will soon be used to the exclusion of iron nails, and, taking everything into consideration, steel really is cheaper than iron. The Pacific Nail Company are already prepared to make steel nails, and will make them of equally good quality with any produced."

The reporter also saw Henry T. Scott, of Prescott, Scott & Co., who expressed himself in regard to the general iron interests of the State, as follows: "At present the demand for manufactured iron on this Coast is lighter than it has been for five or six years, and nearly every manufacturer has already laid in his stock of pig-iron, and at prices above those for which it could be obtained now. Pig-iron of American manufacture here meets with serious competition from English and other European metal, which is brought over for ballast by ships coming for wheat cargoes. European iron formerly formed about 75 per cent of the total amount used; but, owing to the establishment of new manufactories here, the proportion will now, probably, hardly exceed one-half. In a short time, it is thought, the Pacific Coast furnaces will be able to produce all the pig-iron demanded by Pacific Coast manufacturers."

Tempering.

When tempering cold chisels, or any other steel articles, says the *Age of Steel*, heat to a very dull red and rub with a piece of hard soap, then finish heating and harden in clear, cool water. The potash of the soap prevents the oxygen of the atmosphere from uniting with the steel and forming rust or black oxide of iron. The article will need no polishing to enable the colors to be seen. This will be appreciated when tempering taps, dies or various complex forms not easy to polish. Never "upset" a cold chisel. It is sure death to steel. Many of us have lived on a farm and know something about a bundle of nice, straight, clean straw. If you work it intelligently you can tie it up into stout bands for binding other bundles. You can take hold of the ends of that straw and draw out a handful without harm to the straw. After you have drawn out half that bundle a foot or so, try to drive it back; every blow breaks the straw, cripples and doubles it up, and it will hardly bear its own weight, to say nothing of making a band for other bundles. Just so with steel. If you have a broken chisel to sharpen, draw out and cut off, never upset. It will cripple the fibers just as the straw is crippled when driven endwise.

Make chisels short for hard, rough work. They transmit the power or force of a blow much better. Long chisels are apt to "broom up" on the hammer end, as the long steel through which the blow passes has more chance to absorb the force of the blow.

The harder the metal to be worked, the quicker the blow should be transmitted. Cast-iron works much better with a short steel chisel and light hammer, than if the blow was struck upon a very long chisel with a heavy wooden mallet. In one case the blow is delivered all at once, in the other it takes time, and much of the force is absorbed.

Steel Converters and Their Effect on Prices.—There are now 23 steel works, having among them 80 converters, in the German Empire; Austria and Hungary have 12 steel works, with 34 converters; Belgium, 3 steel works, with 18 converters; France, 7 steel works, with 14 converters; England, 23 steel works, with 115 converters, and Russia 5 steel works, with 10 converters. By means of the new processes the price of steel has been reduced in this country from $99.70 in 1882, to $30 in 1884. The reduction in England has been from $67.30 to $22.20 in the same time. The reduction in England has been only $45.11; while in this country it amounts to $69.70.
